SELECTED WATER RESOURCES ABSTRACTS

VOLUME 12, NUMBER 1
JANUARY 1, 1979

W79-00001--W79-00500
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 1
JANUARY 1, 1979

W79-00001--W79-00500

etary of the U.S. Department of the Interior has de-
that the publication of the periodical is necessary in the
n of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews

NVESTIGATIONS OF THE MOLECULAR EIGHT, FREE RADICAL AND METAL IN-ERACTIONS OF ISOLATED AQUATIC AND OIL FULVIC ACID,
ew Hampshire Univ., Durham.
A. Wilson.
vailable from the National Technical Informa-on Service, Springfield, VA 22161 as PB-288 085, ice codes: A07 in paper copy, A01 in microfiche.
aD Dissertation, August 1977, 131 p, 11 fig, 7 tab, 3 ref, append. OWRT-A-035-NH(4), 14-31-0001-29.

escriptors: *Humic acids, *Acidic soils, Chemical reactions, *Fulvic acids, *Acidic ater, Chemical analysis, Metals, Organic acids, oil profiles, Podzols, Acidity, Spec-ophotometry, Molybdenum, *Molecular weight, Free radical, Cryoscopic analysis, Electron ramagnetic resonance, Spin concentration, anadium.

oil and aquatic fulvic acid were isolated from a 3 orizon and a Podzol soil and the Oyster River in ee, N.H., respectively. The isolated materials ere characterized initially by total acidity, func-onal group (carboxyl, carbonyl), elemental ,H,N) and UV-visible spectrophotometric alyses. The molecular weights of soil and quatic fulvic acids were determined using a cryo-opic method analysis. Data were corrected for e dissociation of carboxyl groups. Dissociation orrected number average molecular weights of 4 and 626 were obtained for soil and aquatic ful-c acid, respectively. Additional studies were per-ormed on the free radical specie associated with lvic and humic acids. Electron paramagnetic sonance (epr) spectra for soil fulvic and humic ids reveal an unsymmetric first derivative signal ith g-values of 2.0037 + 0.0002 and line widths of 3 to 5.6 Gauss. Analysis of the relative spin con-ntration revealed a free radical concentration ttern; soil humic acid, aquatic humic acid, soil lvic acid, aquatic fulvic acid. Deoxygenated queous solutions of soil and aquatic fulvic acid ere titrated with base to determine any change in e free radical concentration as a function of pH. he free radical signal showed a dramatic increase intensity at pH values greater than 8. A Hender-on-Hasselbalch equation was used to explain in-reases in the free radical concentration with pH. was proposed that quinone and hydroquinone olecules interact to produce semiquinone olecules at high pH.

POTENTIAL AND LIMITATIONS OF RAINFALL-RUNOFF MODELS FOR PREDICTION ON UNGAUGED CATCHMENTS: A CASE STUDY FROM THE PAPUA NEW GUINEA HIGHLANDS,
Papua New Guinea Univ., Port Moresby (New Guinea). Dept. of Geography.
G. Pickup.
Journal of Hydrology (New Zealand), Vol. 16, No. 1, p 87-102, 1977. 6 fig, 5 tab, 22 ref.

Descriptors: *Rainfall-runoff relationships, *Model studies, *Mathematical models, Watersheds(Basins), Rivers, Mountains, Rainfall, Storms, Precipitation(Atmospheric), Runoff, Foreign countries, Foreign research, Streamflow, Gaging stations, Stream gages, Rain gages, Calibrations, Hydrology, *Papua New Guinea, *Papua New Guinea Highlands.

A modified version of the Boughton model was calibrated for the Tua River Basin in the Papua New Guinea Highlands. The same model parameters then were used to calculate runoff from rainfall for 7 other basins to see whether it is possible to transfer model parameters between similar basins. Model parameters could be transferred successfully between similar basins where low flows are concerned, but higher flows were not always reproduced successfully. (Sims-ISWS)

A TECHNIQUE FOR ESTIMATING CLOCK TWO-HOURLY PRECIPITATION RATE DISTRIBUTIONS,
Air Force Environmental Technical Applications Center, Scott AFB, IL.
D. J. McMorrow.
Report USAFETAC-TN-78-002, May 1978. 13 p, 4 fig, 6 tab, 21 ref.

Descriptors: *Metorology, *Rainfall, *Precipitation atmospheric, *Rainfall intensity, *Clock-hourly precipitation, *Clock two-hourly precipitation, *Precipitation intensity, Weather patterns, Microwaves, Weather data, Climatic data, Distribution patterns, Radio waves, Analytical techniques.

Because precipitation, particularly rainfall, is one of the most significant attenuators of microwave transmissions, accurate estimates of mean rainfall rate distributions along lines of varying lengths is desirable. A method for estimating rainfall distributions over long path lengths is described that shows how clock two-hourly precipitation rate distributions can be derived from distributions of clock-hourly precipitation rate distribution using negative exponential functions. The analytical conversions are provided for 16 climatic regimes in the continental United States and Alaska. Also, the clock-hourly and two-hourly precipitation rate distributions are compared with instantaneous distributions measured over horizontal paths. Examination of the instantaneous rainfall rate distribution along lines in central Illinois indicated that the 1950 hypothesis of Bussey on the point-time ergodicity of rainfall rate distributions may require some adjustment, although the basic assumptions appear reasonably valid. (Majtenyi-IPA)

LOCAL DIFFERENCES IN THE PATTERNS OF VARIABILITY OF TROPICAL RAINFALL: SOME CHARACTERISTICS AND IMPLICATIONS,
University of New England, Armidale (Australia). Dept. of Geography.
I. J. Jackson.
Journal of Hydrology, Vol. 38, No. 3/4, p 273-287, August 1978. 6 fig, 8 tab, 21 ref.

Descriptors: *Rainfall, *Tropical regions, *Variability, Data processing, Correlation analysis, Analytical techniques, Networks, Rain gages, Watersheds(Basins), Rain, Spatial distribution, Daily hydrographs, Monthly, Annual, Weather, Meteorology, Hydrology, Inter-station differences.

The paper illustrated that for time periods of a month or longer, variability patterns of tropical rainfall can differ considerably at nearby locations (i.e., less than 1 km to 20 km). This is so even when stations are in an area of uniform relief and their long-term averages are similar. At one station, rainfall in a particular month or season can be well above average but below average at a station a few km away. The degree of 'localness' of variability patterns is much greater in the tropics than in higher latitudes. This fact is particularly important when the small scale of peasant agriculture in the tropics is considered. It is also significant for rainfall measurement and analysis. (Sims-ISWS)
W79-00113

RAINFALL FREQUENCIES FOR THE PERSIAN GULF COAST OF IRAN,
Dames and Moore, Denver, CO.
U. Kappus, J. M. Bleek, and S. H. Blair.
Hydrologica Sciences Bulletin, Vol. 23, No. 1, p 119-129, March 1978. 2 fig, 4 tab, 19 ref.

Descriptors: *Rainfall, *Probable maximum precipitation, *Duration curves, *Foreign countries, Precipitation(Atmospheric), Frequency, Watersheds(Basins), Statistical methods, Analysis, Model studies, Foreign research, Depth, Analytical techniques, *Iran, *Persian Gulf(Iran), Rainfall depth-duration relationships.

This analysis was undertaken to develop appropriate extreme flood design criteria for a nuclear power plant at Halileh, near Bushehr, Iran, adjacent to the Persian Gulf. Graphical relationships presented provide a convenient means of estimating the probable maximum precipitation and the 2- to 100-year return period rainfall events with durations from 5 min to 24 h. The relationships may be applied for drainage areas up to 25 sq km. Probable maximum precipitation and 2- to 100-year return period rainfall events were estimated. Precipitation depth-duration relationships were derived. The depth-duration-frequency relationships should not be applied to more moun-

tainous areas inland from the Persian Gulf without adjustment for orographic effects. Data used for the estimation of probable maximum precipitation and rainfal depth-duration-frequency relationships, were: (1) precipitation-monthly, daily, and hourly; (2) dewpoint temperature-maximum persistent 12 h values; (3) upper air data-wind and temperature; and (4) annual number of days having thunderstorms. (Humphreys-ISWS)

SOLID STATE EVENT RECORDER FOR RAINFALL MEASUREMENT,
Institute of Hydrology, Wallingford (England).
M. Turner, and G. P. Brunsdon.
Hydrological Sciences Bulletin, Vol. 23, No. 1, p 143-149, March 1978. 5 fig.

Descriptors: *Rainfall, *Precipitation(Atmospheric), *Rain gages, *Instrumentation, Measurement, Precipitation gages, Foreign research, Electronic equipment, Equipment, *United Kingdom, Tipping bucket rain gage, Event recorder.

A solid state event recorder and a reader suitable for use with a tipping bucket raingage were described. The recorder is a small battery operated unit with very low power consumption, capable of recording 64, 8 bit, words. A portable reader unit was used to interrogate it. (Humphreys-ISWS)
W79-00125

A STORM RAINFAL PATTERN ABOVE THE CENTRAL AFRICAN PLATEAU,
Corporation for Engineering, Geological and Hydrological Investigation, Prague (Czechoslovakia). Stavebni Geologie.
J. Balek.
Hydrological Sciences Bulletin, Vol. 23, No. 1, p 151-156, March 1978. 2 fig, 4 tab, 7 ref.

Descriptors: *Rainfall disposition, *Africa, *Tropical regions, *Rainfall, Spatial distribution, Temporal distribution, Analysis, Depth-area-duration analysis, Thunderstorms, Foreign research, *Central African Plateau.

The spatial and temporal distribution of tropical rainfall above a small tropical basin on the Central African Plateau was studied by using a dense network of rainfall recorders. Rainfall on the plateau is associated with thunderstorms, and most of the daily totals originate from rains of a short duration. The resuls indicated a high variability of the rainfall pattern within a small area of less than 5 sq km. Formulas for the calculation of the rainfall rate and depth-area-duration relationship were presented for the purpose of network construction and engineering design in tropical Africa. (Humphreys-ISWS)

CLIMATOLOGY OF INSTANTANEOUS RAINFALL RATES,
Illinois State Water Survey, Urbana.
D. M. A. Jones, and A. L. Sims.
Journal of Applied Meteorology, Vol. 17, No. 8, p 1135-1140, August 1978. 5 fig, 2 tab, 3 ref. AFCRL F19628-69-C-0070, F19628-72-C-0052.

Descriptors: *Rainfall, *Rainfall intensity, *Frequency curves, *Climatology, Rain, Rates, Precipitation(Atmospheric), Rain gages, Instrumentation, Data processing, Precipitation intensity, Meteorology.

Raingage records from four climatic zones (maritime subtropical, continental temperate, maritime temperate, and midlatitude interior) were analyzed to study instantaneous rainfall rates as defined by 1 and 4 min accumulations. The frequency distribution of rainfall rates was determined for stations in each of these climatic zones, and a zonal average frequency distribution was calculated. A progression in the frequency of more intense precipitation was found from the North Pole to the Equator since all of the data were taken from the Northern Hemisphere. The most intense rainfalls were recorded at stations in the maritime subtropical zones and the least intense rainfalls in the maritime temperate zones. (Sims-ISWS)
W79-00327

RELATION BETWEEN THE ST. LOUIS URBAN PRECIPITATION ANOMALY AND SYNOPTIC WEATHER FACTORS,
Illinois State Water Survey, Urbana.
J. L. Vogel, and F. A. Huff.
Journal of Applied Meteorology, Vol. 17, No. 8, p 1141-1152, August 1978. 9 fig, 3 tab, 13 ref.

Descriptors: *Rainfall, *Precipitation(Atmospheric), *Cities, Weather patterns, Spatial distribution, Effects, Weather, Weather data, Rainfall intensity, Synoptic analysis, Winds, Storms, Movement, Summer, Fronts(Atmospheric), Meteorology, *St. Louis(MO), Synoptic weather types, Precipitation anomalies, Project METROMEX.

The summer (June-August) rainfall distribution on the METROMEX network was analyzed to determine the synoptic conditions during which the urban-industrial regions of St. Louis affect the precipitation process. The rainfall patterns were stratified by direction of movement of convective entities in storm systems, surface wind direction, and basic synoptic weather types. The results provided support for enhancement of rainfall downstorm from the urban-industrial region. Although only 23% of the 330 storms moved from the west-southwest, the storms produced 42% of the network rainfall and were strong contributors to the rainfall anomaly that maximizes 25-30 km northeast of St. Louis. Cold front conditions with the major convective entities moving from the southwest and squall lines with any storm motion were associated with the most intense rainstorms over the raingage network, and these storms were also largely responsible for the rainfall anomaly. The rainfall pattern based on air mass storms did not indicate any significant urban enhancement of rainfall and study of squall zone storms suggested possible reduction of rainfall in the urban region. (Sims-ISWS)
W79-00328

ELECTRIC RAINFALL INTENSITY SENSOR,
State Univ. of New York at Albany. Dept. of Atmospheric Science.
T. E. Battalino, and B. Vonnegut.
Journal of Applied Meteorology, Vol. 17, No. 8, p 1225-1231, August 1978. 8 fig, 2 ref. ONR N00014-71-C-0156, N00014-75-C-0221.

Descriptors: *Rain gages, *Rainfall, *Rainfall intensity, Instrumentation, Equipment, Electrical equipment, Precipitation(Atmospheric), Precipitation intensity, Snowfall, Automation, Measurement, Calibrations, Meteorology.

An instrument having a logarithmic response was described that continuously measures rates of rainfall over the range 0.3-350 mm/h by determining the electrical power required to evaporate the water as it arrives on an exposed sensor. Laboratory calibration experiments illustrated characteristics of the instrument, and field tests showed agreement with a standard tipping-bucket raingage. (Sims-ISWS)

SIMULATION OF COLD CLOUD PRECIPITATION IN A THREE DIMENSIONAL MESOSCALE MODEL,
National Oceanic and Atmospheric Administration, Boulder, CO. Atmospheric Physics and Chemistry Lab.
C. F. Chappell, and D. R. Smith.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 265, Price codes: A03 in paper copy, A01 in microfiche. Technical Report ERL 381-APCL40, October 1976. 30 p, 48 fig, 16 ref, 1 append. Bu. Rec. 14-06-D7676.

Descriptors: *Cloud physics, *Weather forecasting, *Weather modification, *Model studies, Mathematical models, Nucleation, Cloud seeding, Ice, Snow, Precipitation(Atmospheric), Clouds, Rainfall, Forecasting, Equations, Weather, Meteorology.

A cold cloud microphysical model was developed and merged with a 15-level primitive equation mesoscale dynamical model. The microphysical model partitions ice particles into three categories: unrimed, partially rimed, and graupel. Each is considered to have a Marshall-Palmer distribution and is assigned its own set of physical characteristics. Criteria for converting from one ice particle category to another were based on a comparison of accretional to depositional growth rates. Six prognostic equations predict the concentration and mixing ratio for each ice particle category. Processes in the model include deposition, accretion, condensation, evaporation, sublimation, nucleation, and sedimentation. Microphysical processes were coupled back into the dynamical prediction equations so that the effect of ice processes on the air flow could be investigated. The mesoscale model was used to investigate numerically the development and distribution of snowfall over a mountain massif during a 4500-second integration. It appears to simulate realistically the nucleation and growth of ice particles and their transport and sedimentation to the mountain surface. Snowfall distribution, including the leeward extent of precipitation, also appears reasonable and consistent with that observed along the continental divide of Colorado for similar wind regimes. ICEBREAKING CAPABILITY OF CCGS 'LABRADOR' IN WESTERN BARROW STRAIT, OCTOBER 23-28, 1973,
Department of the Environment, Ottawa (Ontario). Marine Sciences Directorate.
J. D. Bradford.
Manuscript Report Series No. 50, 1978. 13 p, 3 fig, 4 tab, 16 ref.

Descriptors: *Sea ice, *Icebreakers, *Ice cover, *Barrow Strait, Navigation, *Ice loads, McDougall Sound, 'Labrador', Arctic ice, Ice breakup, Ships.

In October 1973, the Canadian government icebreaker CCGS 'Labrador' carried out performance trials in the western Barrow Strait. Progress of the vessel was monitored as it passed through light ice conditions for approximately 320 miles in the Barrow Strait-McDougall Sound area. Ice thickness and pressure were observed whenever possible. Most of the time, the 'Labrador' operated in continuous mode without having to stop, back up, and charge through blocking ice. However, enough resistance was encountered to suggest that in normal years, vessels with the icebreaking capacity of the 'Labrador' would be unable to operate in the Barrow Strait beyond mid-November. Ice conditions from 1962-1973 and ice thickness measurements from 1956 to 1973 are summarized. Also, capacities of several icebreaking vessels in various ice conditions are compared. (Majtenyi-IPA)
W79-00090

FRAZIL ICE FORMATION: A REVIEW,
Alaska Univ., College. Geophysical Inst.
T. E. Osterkamp.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY9, Proceedings Paper 14023, p 1239-1255, September 1978. 3 fig, 1 tab, 63 ref, 1 append.

Descriptors: *Frazil ice, *Rivers, *Ice, *Reviews, Crystal growth, Nucleation, Open channels, Turbulent flow, Supercooling, Heat transfer, Theoretical analysis, Water temperature, Crystals, Freezing, Mathematical models, Physical properties, Equations, Crystal growth, Ice jams, On-site investigations, Ice formation.

The problems associated with frazil ice formation were examined; the current state-of-the-art was reviewed; and recommendations for future research were made. No priorities were assigned to these recommendations. Future research should focus on obtaining heat transfer data, temperature measurements, flow measurements, physical measurements on frazil ice crystals (particularly frazil ice concentration), frazil ice nucleation processes, evolution of frazil ice crystals, anchor ice formation, forecasting the occurrence of frazil ice, entrainment of frazil ice crystals in the flow and the resulting two-phase flow, adherence of frazil ice crystals to each other and to objects in the flow, granular growth in pans, flow producing mechanisms in rivers, and the initiation and development of river ice covers from frazil ice. The greatest need is for field measurements and field investigations of the preceding problems during periods of frazil ice formation in rivers. (Humphreys-ISWS)

INLAND ICE SHEET THINNING DUE TO HOLOCENE WARMTH,
Ohio State Univ., Columbus. Dept. of Geology and Mineralogy; and Ohio State Univ. Research Foundation, Columbus. Inst. of Polar Studies.
I. M. Whillans.
Science, Vol. 201, No. 4360, p 1014-1016, September 15, 1978. 2 fig, 18 ref.

Descriptors: *Ice, *Ice cover, *Recent epoch, *Antarctica, Model studies, Mathematical models, Climatology, Glaciers, Glaciology, Ice sheets, Ice sheet thinning, Warming.

The climatic warming of 10,000 years ago is now affecting the central portions of ice sheets, causing ice-flow acceleration. This process explains the present-day thinning of the ice sheet in West Antarctica. Former ice sheets also must have responded to climatic warming with a delay of thousands of years. This lag in response is important in the climatic interpretation of glacial deposits and of changes in ice volume obtained from deep-sea cores. (Sims-ISWS)

CHEMICAL INHIBITORS OF PLANT TRANSPIRATION: IV. ACTION OF ALAR-85, (IN FRENCH),
Institut Pasteur, Paris (France).
J. Sivadjian.
Bull Soc Bot Fr 123(3/4), p 107-111, 1976.

Descriptors: *Chemical inhibitors(Plants), *Transpiration, *Plant transpiration, *Alar-85, *Daminozide, Acids, Vicia-Faba.

B-995 or N-dimethylaminosuccinamic acid, is a white powdered substance known as Alar-85 or Daminozide. The transpiration of the leaves of the broad bean (Vicia faba) was significantly decreased if they were treated with a 2% solution of Alar-85 for 4 days. The action was more important at the upper surface of the leaflets than at the lower surface.--Copyright 1978, Biological Abstracts, Inc.

A SIMPLE MODEL FOR SHALLOW LAKE EVAPORATION,
Royal Netherlands Meteorological Inst., De Bilt (Netherlands).
H. A. R. de Bruin.
Journal of Applied Meterology, Vol. 17, No. 8, p 1132-1134, August 1978. 3 fig, 11 ref.

Descriptors: *Evaporation, *Lakes, *Model studies, Energy budget, Latent heat, Foreign countries, Foreign research, Vapor pressure, Meteorological data, Water, Moisture defecit, Equations, *Lake evaporation, *Shallow lake evaporation, *The Netherlands, Empirical model, Penman equation, Saturated surfaces, Saturation vapor pressure.

The empirical model of Priestley and Taylor and the well-known Penman equation were combined to obtain a simple expression for evaporation from a shallow lake. The model was tested for a large lake in The Netherlands with an area of about 460 sq km and an average depth of 3 m. The estimated values of evaporation of 1, 5, 10, and 20 days were compared with energy-budget measurements. The comparison indicated that the proposed model gave good results for periods of 10 days or more. (Roberts-ISWS)

A FIELD EVALUATION OF SUBSURFACE AND SURFACE RUNOFF, I. TRACER STUDIES,
New South Wales, Kensington (Australia). School of Civil Engineering.
D. H. Pilgrim, and D. D. Huff.
Journal of Hydrology, Vol. 38, No. 3/4, p 299-318, August 1978. 6 fig, 1 tab, 28 ref.

Descriptors: *Runoff, *Surface runoff, *Subsurface runoff, *Tracers, Radioisotopes, Bromine, Chromium, On-site investigations, Isotope studies, Soil water movement, Spatial distribution, Temporal distribution, Storm runoff, Rainfall, Drainage, Infiltration, Hydrology, Soil water.

Recent studies have demonstrated the occurrence of a variety of storm runoff processes, including those associated with variable source areas. However, there is a need for experimental methods for studying the spatial variability of these processes in the field. One promising method is the use of tracers. When two radiotracers, 51Cr and 82Br, were used in a pilot study of surface and subsurface storm runoff, irregular spatial flow patterns were observed. These patterns were related primarily to the thickness of the surface soil horizon and showed the value of tracers for quantifying horizontal and vertical profiles of flow pathways. Several improvements are possible in measurement techniques and should provide a means for obtaining detailed spatial definition of surface and subsurface storm flow pathways in the field. A FIELD EVALUATION OF SUBSURFACE AND SURFACE RUNOFF, II. RUNOFF PROCESSES,
New South Wales Univ., Kensington (Australia). School of Civil Engineering.
D. H. Pilgrim, D. D. Huff, and T. D. Steele.
Journal of Hydrology, Vol. 38, No. 3/4, p 319-341, August 1978. 6 fig, 41 ref.

Descriptors: *Runoff, *Surface runoff, *Subsurface runoff, *On-site investigations, Storm runoff, Rainfall, Soil water, Soil water movement, Sediments, Dissolved solids, Suspended solids, Flow, Hydrographs, Infiltration, Electrical conductance, Water chemistry, Tracers, Isotope studies, Hydrology, Runoff types.

Combined use of radioisotope tracer, flow rate, specific conductance, and suspended-sediment measurements on a large field plot near Stanford, California, has provided more detailed information on surface and subsurface storm runoff processes than woul be possible from any single approach used in isolation. Although the plot was surficially uniform, the runoff processes were shown to be grossly nonuniform, both spatially over the plot, and laterally and vertically within the soil. The three types of processes that have been suggested as sources of storm runoff (Horton-type surface runoff, saturated overland flow, and rapid subsurface throughflow) all occurred on the plot. The nonuniformity of the processes supports the partial- and variable-source area concepts. Subsurface storm runoff occurred in a saturated layer above the subsoil horizon, and short travel times resulted from flow through macropores rather than the soil matrix. Consideration of these observations would be necessary for physically realistic modeling of the storm runoff process. (See also W79-00115) (Sims-ISWS)

AN ESTIMATE OF ANNUAL RUNOFF FROM ENGLAND AND WALES, 1728-1976,
Department of the Environment, Reading (England). Water Data Unit.
T. J. Marsh, and I. G. Littlewood.
Hydrological Sciences Bulletin, Vol. 23, No. 1, p 131-142, March 1978. 6 fig, 2 tab, 9 ref.

Descriptors: *Runoff, *Discharge(Water), *Annual, Foreign countries, Watersheds(Basins), Model studies, Analysis, Methodology, Statistical methods, Foreign research, *England, *Wales.

One consequence of the 1975-1976 drought was a growing concern about the distribution with respect to time of the available water resources in England and Wales. Various indices of drought have been derived based largely on records of rainfall, but in some cases on studies of the discharge for certain rivers. This paper presented estimates of annual runoff from England and Wales as a whole, from 1728 to 1976. Simple probability analysis showed that annual runoff from England and Wales of the order of 300 mm can be expected, on average, once every 20 years and runoff of 200 mm, on average, once every 125-200 years. Temporal vairations of water-year runoff from England and Wales must still be considered random due to the lack of statistical evidence to suggest otherwise. (Humphreys-ISWS)

LOW-FLOW CHARACTERISTICS OF STREAMS ON THE OLYMPIC PENINSULA, WASHINGTON,
Geological Survey, Tacoma, WA. Water Resources Div.
W. L. Haushild, and D. E. LaFrance.
Open-file report 77-812, 1978. 25 p, 5 fig, 1 plate, 3 tab, 8 ref.

Descriptors: *Low flow, *Streamflow, Base flow, *Streamflow forecasting, *Flow duration, Low-flow frequency, Flow rates, Runoff, *Washington, *Olympic Peninsula(Wash).

Streams in lowland basins of the Olympic Peninsula, Washington, generally have their low flows in summer and peak flows in winter, whereas streams originating at higher elevations in the mountains have their low flows in late summer-early fall and they have both winter and spring peak flows. Data from long-term stations indicate no important trend in low flows during 1940-73 but they do indicate that low flows generally were lower during the relatively dry 1940's than during the relatively wet 1950-73 period. The magnitude and frequency of 7-day low flows were estimated for 116 sites either from frequency analyses of a data at long-term stations or from correlation of data at a short-term station with data at an appropriate long-term station. ANALYSIS OF FLOOD RESULTING FROM THE TOCCOA FALLS, GEORGIA, DAM BREAK,
Geological Survey, Bay St. Louis, MS. Water Resources Div.
L. F. Land.
In: Conference on Flash Floods; Hydrometeorological Aspects, May 2-5, 1978, Los Angeles, California: Published by the American Meteorological Society, Boston, Mass., p 127-130, 1978. 2 fig, 1 tab, 4 ref.

Descriptors: *Floods, *Dam failure, *Flood data, *Flood discharge, *Peak discharge, Flood frequency, Rainfall, Storm runoff, Georgia, *Toccoa Falls Dam, Comparison analysis, Natural floods.

Hydrologic data are presented for the flood resulting from the Toccoa Falls, Georgia, dam break on November 6, 1977. Magnitudes of the dam-break flood are compared with the magnitudes of the flood that would have been expected from the rainfall had the dam break not occurre. Comparisons are also made with 10- and 100-year flood estimates. The magnitude of the peak discharge directly below the dam break was about 25 times the natural 10-year flood. By the time the flood wave reched a point 7.75 miles downstream, the peak discharge was attenuated so the magnitude was in the range of the 10- to 100-year natural flood.

MODEL OF THE FLOODING CAUSED BY THE FAILURE OF THE LAUREL RUN RESERVOIR DAM, JULY 19-20, 1977, NEAR JOHNSTOWN, PENNSYLVANIA,
Geological Survey, Harrisburg, PA. Water Resources Div.
J. T. Armbruster.
In: Conference on Flash Floods; Hydrometeorological Aspects, May 2-5, 1978, Los Angeles, California: Published by the American Meteorological Society, Boston, Mass., p 190-193, 1978. 1 fig, 5 ref.

Descriptors: *Model studies, *Dam failure, *Floodwater, *Mathematical models, *Flash floods, Synthetic hydrology, Pennsylvania, *Johnstown area, *Laurel Run Reservoir Dam.

On july 19 and 20, 1977, a severe rainstorm caused heavy flooding to many areas near Johnstown, Pennsylvania. This paper is concerned only with the flooding in the Laurel Run basin; much of the flood was caused by the failure of Laurel Run Reservoir Dam. A mathematical model of a breach-induced flood wave was applied to the Laurel Run dam failure. The model estimates wave velocity and height, peak discharges, and other flood-wave characteristics for the reach from the dam to the mouth of Laurel Run, about 2.5 miles. Water-surface elevations simulated by the model are in close agreement with high-water profile data collected in the field.

FLOOD REGIONS IN JAMAICA,
Calgary Univ., Alberta. Dept. of Geography.
L. C. Nkemdirim, and E. B. Jones.
Hydrological Sciences Bulletin, Vol. 23, No. 1, p 63-83, March 1978. 19 fig, 6 tab, 7 ref.

Descriptors: *Floods, *Flood plains, *Regional flood, Streamflow, Rainfall, Drainage, Drainage area, Drainage density, Hydrology, Foreign countries, Islands, Watersheds(Basins), *Flood regions, *Jamaica, *West Indies, Stream frequency, Stream order.

This paper showed that flood potential regions in Jamaica can be derived from data on streamflow, rainfall, and drainage basin characteristics. The probability curves for each region may be used to estimate flood frequency in uncalibrated basins in the region or in sections of streams that are hitherto ungaged. The relationship between the annual average on-day flood flow and the instantaneous annual maximum flood is good enough to enable estimates of the latter to be made when only the former is known. SIMULATION OF FLOWS IN UNGAGED BASINS,
Severn-Trent Water Authority, Birmingham (England).
R. E. Manley.
Hydrological Sciences Bulletin, Vol. 23, No. 1, p 85-101, March 1978. 5 fig, 6 tab, 11 ref.

Descriptors: *Simulation analysis, *Basins, *Model studies, Streamflow, Hydrology, Mathematical models, Flow, Computer models, Computers, *Ungaged basins, Streamflow simulation, Model calibration.

There are two ways in which a hydrological simulation model can be used to estimate flows in an ungaged basin. The first method, and the only one generally used so far, is to calibrate the model to a similar basin and use the parameter values thus obtained. The second is to use parameters based on measured basin characteristics. Described herein was a model for which most of the parameters are of the second type. This model was applied using mesured basin characteristics to obtain the parameter values and without reference to the gaged flows. The accuracy of the model was good, the correlation coefficient for daily flows being 0.86 and for monthly fows being 0.97. The model was then calibrated to the basin using a version of the Rosenbrock method. Comparison of measured and calibrated parameter values demonstrated the viability of this approach. (Lee-ISWS)

A GENERAL TWO DIMENSIONAL RIVER SIMULATOR,
Waterloo Univ. (Ontario). Dept. of Systems Design.
M. Chandrashekar, L. R. Muir, and T. E. Unny.
In: Proceedings of the International Symposium, University of Manitoba, Winnipeg, Canada, August, 1976, entitled 'Large Engineering Systems'. Alvin Wexler (Ed.), Pergamon Press, Inc., Oxford, United Kingdom, p 473-482, 1977. 5 fig, 2 tab, 4 ref.

Descriptors: *River systems, *Simulation analysis, *Unsteady flow, Estuaries, Computer programs, Algorithms, *Hydrology, Equations, Mathematical models, Systems analysis, Sparse matrix techniques, Finite-difference model.

In recent years, considerable attention has been focussed on the use of implicit finite-difference schemes for solving unsteady flow problems in rivers and estuaries. The major advantage of the implicit method is its unconditional stability for any time or distance steps. The main obstacle in using the method has been the necessity to solve a large system of linearized equations. The algorithm presented herein deals with a two dimensional implicit finite-difference model suitable for the solution of the Navier-Stokes equations; the system of linear equations is solved using sparse matrix techniques. The model has been implemented into a computer program which accepts arbitrary river configurations and different boundary conditions. The model has been applied to a portion of the St. Clair River (which borders the state of Michigan and the province of Ontario). Also, numerical experiments have been carried out on a hypothetical river system. Results are presented. It is concluded that the model has clearly shown the validity and applicability of a two dimensional implicit finite difference scheme for the solution of general river systems. Further work is to be done regarding the effect of changing Manning's n as a function of river bed shape, inclusion of double boundary conditions, and special boundary conditions at the 270 degree corners. RIVER TEMPERATURE VARIATION WITH FREEZING AND STORAGE,
Minnesota Univ, Minneapolis. Dept. of Civil and Mineral Engineering; and Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
C. C. S. Song, and K. S. Leung.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Proceedings Paper 14054, Vol. 104, No. EE5, p 879-888, October 1978. 6 fig, 4 ref, 1 append. NSF ENG74-02036.

Descriptors: *Water temperature, *United States, *Rivers, *Model studies, Mathematical models, Stochastic processes, Air temperature, Freezing, Storage, Correlation analysis, Probability, Regression analysis, Water storage, Temperature, Streams, Ice, Thermal properties, Thermal water, Variability.

Water temperature in the northern part of the US is significantly affected by the freezing phenomenon. Because of the freezing constraint on the variability of water temperature, there is a good correlation between the mean value and the fluctuating component. The probability density curve of water temperature variation develops a sharp peak near the freezing point. A stochastic model using two independent variables, air temperature variation, and the mean daily water temperature, was developed. It also was shown that the water temperature variability tends to decrease as a dimensionless reservoir storage capacity decreases. (Sims-ISWS)

Controversy regarding origins of the so-called Hurst phenomenon has continued since the first appearance of Hurst's work. There appear to be at least two general mechanisms which might generate geophysical time series displaying the Hurst phenomenon. The first is nonstationarity of process mean level perhaps owing to dynamic characteristics of the entire earth geophysical system. The second generating mechanism is a stationary model structure such as the Box-Jenkins models with parameters such that substantial low-frequency effects are present. A series of Monte Carlo tests were formed which showed that it will generally be very difficult to distinguish between the two generating mechanisms on the basis of geophysical records of lengths usually available. The Monte Carlo experiments were augmented by analysis of several series of tree ring growth indices ranging in length from 506 to 1,164 years. Analysis of these sequences for nonstationarity in mean level showed that the sequences were entirely compatible with stationary Box-Jenkins models earlier fit to the data by Hipel. However, a similar analysis of the variance of the time series showed that there was evidence nonstationarity in the variances of the records such that the time series were not compatible with the constant variance assumption of the stationary Box-Jenkins models. Finally, sevral reservoir simulations were made by using the sequent peak algorithm for type A (nonstationary mean) and type B (constant mean) models which had been found to be statistically indistinguishable in the Monte Carlo experiments. The results showed that so long as nonstationarity in mean level was modest and demand levels were not too high, the models give very similar results; however, at high demand levels or large non-stationarity in process mean, substantial differences in storage requirements may result. Descriptors: *Groundwater movement, *Model studies, *Mathematical models, Aquifers, Analytical techniques, Equations, Numerical analysis, Groundwater, Wells, Water wells, Hydrology, Boussinesq equation, Flow fields.

A simple technique to solve the linearized two-dimensional Boussinesq equation in a nonsteady flow field with arbitrary shape was presented. According to this technique, the reservoir boundaries are replaced by small sources emitting attentuating waves. The characteristic content of each source depends on the shape of the flow field. The variation of the free surface at any point of the flow field results from the interaction of all the waves arriving at that point. This technique was applied to a flow field which is confined by rectilinear and

curvilinear boundaries. The results indicated satisfactory proximity to those obtained by numerical analysis. (Sims-ISWS)

Descriptors: *Groundwater, *Aquifers, *Wells, *Model studies, Mathematical models, Permeability, Specific yield, Drawdown, Storage, Storage capacity, Groundwater movement, Anisotropy, On-site investigations, Test wells, Pumping, Water wells, Hydrology.

A digital model solution was sought for the unsteady-state radial flow to a partially penetrating well pumping at a constant rate from an unconfined anisotropic aquifer. The solution technique used was the iterative alternating-direction implicit method. Attention was focused on the utility of the digital model to analyze aquifer test data in unconfined aquifers so as to evaluate the lateral permeability, vertical permeability, specific storage, and specific yield of the aquifer. That an approximate steady-state solution of flow to partially penetrating wells in unconfined aquifers can be sought also was illustrated. The digital model was applied to analyze field aquifer test data of the time distribution of average drawdown at well screen depths, and of water table drawdown at two radial distances from the test well. A NOVEL METHOD OF ESTIMATING THE DISCHARGE OF WATER FROM MOUND SPRINGS OF THE GREAT ARTESIAN BASIN, CENTRAL AUSTRALIA,
South Australia Dept. of Mines, Adelaide.
A. F. Williams, and J. W. Holmes.
Journal of Hydrology, Vol. 38, No. 3/4, p 263-272, August 1978. 5 fig, 7 ref.

Descriptors: *Springs, *Australia, *Discharge(Water), *Measurement, Aerial photographs, Artesian aquifers, Flow, Seepage, Swamps, Streams, Vegetation, Evaporation, Aquifers, Fractures(Geologic), Hydrogeology, *Mound springs.

The discharge of mound springs of northern South Australia was measured by conventional stream-gauging methods during 1974. However, many springs are difficult of access or do not provide well-defined stream courses. Correlation of the measured springs with the area of swamp vegetation which they support showed that the spring water is dissipated by a mean evaporative flux of 6.5 mm/day + or -0.7. Such a measure could be applied to estimate spring discharges wherever aerial photographs suitable for a reliable delineation of the evaporating area of the associated swamps are available. Most of the methods currently used in hydrosciences for interpolation and spatial averaging fail to quantify the accuracy of the estimates. The theory of regionalized variables enables one to point out the relationship between the spatial correlation of hydrometeorological or hydrogeological fields and the precision of interpolation, or determination of average values, over these fields. A new estimation method called kriging has proven to be quite well adapted to solving water resources problems. Presented herein was a series of case studied in automatic contouring, data input for numerical models, estimation of average precipitation over a given catchment area, and measurement network design. A NEW FINITE ELEMENT TECHNIQUE FOR THE SOLUTION OF TWO-PHASE FLOW THROUGH POROUS MEDIA,
Princeton Univ., NJ. Dept. of Civil Engineering.
P. S. Huyakorn, and G. F. Pinder.
Advances in Water Resources, Vol. 1, No. 5, p 285-298, September 1978. 18 fig, 18 ref, 1 append.
NSF AER74-01765.

Descriptors: *Groundwater movement, *Porous media, *Model studies, *Finite element analysis, Mathematical models, Analytical techniques, Flow, Groundwater, Numerical analysis, Equations, Hydrology, Weighting functions.

A new upstream weighting finite element technique was developed for improved solution of the two-phase immiscible flow equations. Unlike the upstream weighting technique used by previous investigators, the new technique does not employ finite difference concepts to achieve the required upstream weighting of relative permeabilities or mobilities. Instead, upstream weighting is achieved by (1) representing the relative permeabilities or mobilities as continuous functions expressed in terms of the shape functions and nodal values, and (2) using asymmetric weighting functions to weight the spatial terms in the flow equations. These weihting functions are constructed such that they are dependent on the flow direction along each side of an element. In conjunction with the proposed technique, two solution schemes for treating the resulting set of non-linear algebraic equations were presented. These are the fully-implicit chord slope incremental solution scheme and the Newton-Raphson solution scheme. Both schemes allow the use of large time steps without being unstable. The proposed numerical technique was applied to two problems: (1) the one-dimensional Budkley-Leverett problem, and (2) the two-dimenstional five-spot well flow problem. Results indicated that this technique is superior to not only earlier finite element schemes but also to five-point upstream finite difference formulas. (Sims-ISWS)

TYPE-CURVE ANALYSIS OF TIME-DRAWDOWN DATA FOR PARTIALLY PENETRATING WELLS IN UNCONFINED ANISOTROPIC AQUIFERS,
Indian Inst. of Tech. Kanpur. Dept. of Civil Engineering.
V. Lakshminarayana, and S. P. Rajagopalan.
Ground Water, Vol. 16, No. 5, p 328-333, September-October 1978. 5 fig, 16 ref.

Descriptors: *Curves, *Graphical analysis, *Aquifers, *Water wells, *Drawdown, Analytical techniques, Computer models, Water table aquifers, Anisotropy, Penetration, Permeability, Depth, Specific yeild, Storage coefficient, Model studies, *Partial penetration, *Type curves, Time-drawdown data.

With the aid of a computer, and using an iterative alternating-direction implicit method, a numerical solution was sought for the unsteady-state radial flow to partially penetrating wells pumping at a constant rate from an unconfined anisotropic aquifer. These solutions were used to generate a series of theoretical type curves valid for individual aquifer test situations characterized by particular combinations of two constants C sub 1 = (P sub r/P sub z)(m/r sub w)(m/r sub w) and C sub 2 = (S sub y/S sub s(m)) and particular well penetration. The aquifer test data requirements are the time-drawdown data and at least two pairs of observation wells, one of the pair tapping well-screen depths and the other tapping water table depths. The parameters that were identified are the lateral permeability, vertical permeability, specific storage, and specific yield of the aquifer. The use of the type curves was illustrated by an example. A DIGITAL MODEL OF PART OF THE RIO TEMPISQUE ALLUVIAL AQUIFER, COSTA RICA,
Servicio Nacional de Aguas Subterraneous, San Jose (Costa Rica).
D. Mora-Castro, and J. W. Lloyd.
Journal of Hydrology (New Zealand), Vol. 16, No. 1, p 73-86, 1977. 8 fig, 2 tab, 8 ref.

Descriptors: *Computer models, *Alluvial aquifers, *Hydrogeology, Groundwater resources, Groundwater availability, Drawdown, Pumping, Water wells, Transmissivity, Specific yield, Groundwater recharge, Equations, Model studies, Water levels, *Costa Rica, Interference, Well loss, Finite-difference technique.

The hydrogeology of the area was discussed, and the method used in producing a digital model simulation of the alluvial aquifer was described. The availability of groundwater resources in the area is indicated by modelled areal abstractions and drawdown modified by a simple 'worst well' concept of well interference and well loss. Introducing this concept reduces the postulated allowable areal abstraction in the study area by 50%. (Visocky-ISWS)

THE ISOTOPE HYDROLOGY OF THE MEREENIE SANDSTONE AQUIFER, ALICE SPRINGS, NORTHERN TERRITORY, AUSTRALIA,
Australian Atomic Energy Commission, Lucas Heights, New South Wales (Australia). Isotope Div.
G. E. Calf.
Journal of Hydrology, Vol. 38, No. 3/4, p 343-355, August 1978. 6 fig, 3 tab, 19 ref.

Descriptors: *Geochemistry, *Isotope studies, *Australia, Aquifers, Sampling, Water quality, Carbon radioisotopes, Deuterium, Oxygen isotopes, Wells, Carbonates, Rain, Groundwater recharge, Hydrogeology, Arid climates, Depth, Graphical analysis.

The town of Alice Springs is situated within the arid zone of central Australia and derives its water supply from production bores in Mereenie Sandstone. Twenty-nine samples of this water and other surrounding water have been analyzed for their chemical, radiocarbon, stable carbon, deuterium, and 180 composition to investigate recharge to the quifer system. The measures 14C contents range from 5.1 to 63.4% modern. There is no correlation between borehole depth and percentage modern carbon; however, the samples fall into several groups when the percentage modern carbon is plotted against the reciprocal of the total carbonate content. Within each group, the delta D and delt 180 values are constant and isotopically much lighter than the average annyal rainfall value. It is believed that each group represents a single recharge event, and that recharge to the aquifer system occurred at intervals of a few millennia, when climatic conditions were different from those of today. (Visocky-ISWS)

HYDROGEOCHEMISTRY OF A CALCRETE-CONTAINING AQUIFER NEAR LAKE WAY, WESTERN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Wembly (Australia). Div. of Mineralogy.
A. W. Mann, and R. L. Deutscher.
Journal of Hydrology, Vol. 38, No. 3/4, p 357-377, August 1978. 7 fig, 2 tab, 29 ref.

Descriptors: *Hydrogeology, *Geochemistry, *Groundwater, *Playas, *Australia, Aquifers, Sampling, Water quality, Carbonates, Equilibrium, Hydrogen ion concentration, Calcite, Dolomite, Gypsum, Mineralogy, Arid climates, Semi-arid climates, Wells, Rain, Weathering, Evaporation, Evapotranspiration, Bicarbonates, Chlorides, Silicates, Clays, *Calcrete, Carbonate equilibria.

Twenty-six water samples from representative sampling locations within a calcrete-containing drainage have been chemically analysed and the results processed to obtain information relevant to the genesis of calcrete. Comparison of major-element concentrations with that of Cl(-) suggests chemical precipitation of Ca(2+), Mg(2+), SO4(2-) and silica within the drainage basin. The HCO3(-) ion concentration is independent of Cl(-) ion concentration (r = 0.30). Groundwater pH appears to be determined by interaction of silica minerals with groundwater and to a lesser extent by carbonate equilibria wherever calcite occurs. Calculated solubility indices give an accurate representation of the distribution of calcite, dolomite, aragonite, silica, gypsum and sepiolite within the drainage basin. Carbonate equilibria appropriate to 25C have been applied to all samples to obtain from the measured HCO3(-) concentration, activities for H2CO3, CO3(2-), and P sub CO2 values-the mean P sub CO2 is 10 to the -2.01 + or - 0.28 power bar. Equilibration of neutral of slightly alkaline groundwaters with this CO2 is responsible for the production of CO3(2-) ion activities of the order of 0.00001 required for precipitation of Ca-Mg carbonate. HYDROGEOLOGY OF THE GRANDE PRAIRIE AREA, ALBERTA,
Research Council of Alberta, Edmonton.
D. Hackbarth.
Report 76-4, 1977. 17 p, 4 fig, 1 tab, 21 ref.

Descriptors: *Hydrogeology, *Canada, *Groundwater, Geologic mapping, Aquifers, Groundwater movement, Groundwater resources, Water wells, Pumping, Water yield, Transmissivity, Base flow, Geochemistry, Dissolved solids, *Alberta(Canada).

The Grande Prairie map area is located between longitudes 118 deg west and 120 deg west and latitudes 55 deg north and 56 deg north. It covers approximately 6,000 sq mi (15,500 sq km). Precipitation is about 18 in (46 cm) annually, while the potential evapotranspiration is about 19 in (48 cm). Geological units of hydrogeological interest include the surficial deposits, the Wapiti Formation, and the Smoky Group. The latter two are of Late Cretaceous age. The region is divided into two hydrogeological areas: (1) a southern area in which groundwater is abundant, with 20-year safe yields of 25 igpm (2 l/s) common and water of reasonably good quality, and (2) a northern area in which groundwater is not usually available and is of very poor quality. In addition to the 1:250,000 scale groundwater availability map, maps at 1:1,000,000 scale present the hydrochemistry of the surficial deposits and of the bedrock. (Visocky-ISWS)

IRRIGATED SOILS OF THE MILSKAYA PLAIN (IN RUSSIAN),
M. P. Babaev.
Izv Akad Nauk Az Ssr Ser Biol Nauk 3, p 64-68, 1975.

Descriptors: *Irrigated soils, *Milskaya Plain(USSR), *Soils, USSR, Water regime.

In the Miliskaya plain (USSR) under the effect of century-long and intense irrigation there was a change in the water regime (an irrigation-hydromorphic water regime was established in the irrigated soils) in the direction of the soil formation process, and the irrigated soils were enriched with nutrient elements. There is a need for a detailed study of the diagnostic features and refinement of the nomenclature and the development of new methods of survey of irrigated soils.

SOIL, WATER AND AIR SCIENCES RESEARCH.
Science and Education Administration, Washington, DC.
Available from Supt. Doc., U.S. Gov't. Print. Off., as Stock No. 001-007-00902-2. Annual Report, 1978. 270 p, 741 ref.

Descriptors: *Water resources, *Land use, *Soil conservation, *Water conservation, *Natural resources, Irrigation, Drainage, Saline soils, Soil physical properties, Fertility, Environmental effects, Land reclamation, Crops, Revegetation, Erosion control, Solar radiation, Wind energy, Sediment control, Agricultural runoff, Agricultural chemicals, Flood control, Reservoir sedimentation, Cultivation, Air pollution effects, Pesticides, Phytotoxicity, Crop production, Precipitation(Atmospheric), Water pollution, Soil contamination.

Soil, water and air sciences research carried out under nine National Research Programs and one Special Research Program, are briefly described. The programs deal with the following subjects: (1) assessment and reduction of salt damage to crops, soils, and eaters; (2) improvement of irrigation and drainage for more efficient crop production; (3) development of tillage practices for improved crop production, reduced costs and energy consumption, and improved conservation of soil and water;

(4) more efficient use and management of solar and wind energy and precipitation; (5) revegetation and reclamation of land areas disturbed by man; (6) management and conservation of soil fertility for increased production and enhanced nutritional quality of plant and animal products; (7) prevention or reduction of environmental pollution resulting from agricultural or other practices; (8) prediction of water yields, sediment amounts and sources, and agricultural chemical loadings in streams and rivers; (9) control of flooding, reservoir sedimentation, soil erosion, and chemical transport by wind and water. USE OF DUMMY VARIABLES IN WATER RESOURCES STUDIES,
Florida Univ., Belle Glade. Inst. for Food and Agricultural Sciences.
S. F. Shih, and W. F. P. Shih.
Journal of Hydrology, Vol. 38, No. 3/4, p 289-298, August 1978. 2 fig, 1 tab, 16 ref.

Descriptors: *Water resources, *Land subsidence, *Water levels, *Analytical techniques, *Florida, Agriculture, Crops, Land use, Subsidence, Regression analysis, Soil-water-plant relationships, Statistics, Statistical methods, Soil water, Groundwate, Dummy variables.

Dummy variables 1 and 0 used as an alternative to analyze the variance and convariance to compare the relationship among groups of observations were introduced. Seven-year data of organic soil subsidence in Everglades Agricultural Area related to water table depth and crop were used to demonstrate the techniques of application. Comparisons of the performance of this dummy variable technique with the standard technique were made. The results showed that the dummy variable regression not only can perform a good result as performed by the standard technique, but also can simultaneously test the difference between two regression lines whether due to slope coefficients or to intercept terms. RATIONAL DETERMINATION OF UNDERDRAINAGE SYSTEM FROM THE HYDRAULIC POINT OF VIEW: STUDIES ON UNDERDRAINAGE OF CLAYEY PADDY SOIL: III. (IN JAPANESE),
Kyoto Univ. (Japan). Faculty of Agriculture.
Y. Fujioka, and T. Maruyama.
Trans Jap Soc Irrig Drain Reclam Eng. 37, p 33-38, 1971.

Descriptors: Measurement, *Clayey, *Drainage, Equations(Hydraulic), Paddy soils, Soils.

Previously, underdrainage discharge was customarily expressed as standard value of 1 l/s/ha when planning an underdrainage system. This standard measurement is insufficient in an underdrainage system where the soil permeability is very high. The capacity of the underdrainage system must be determined after taking into consideration soil permeability and permissible drainage velocity. An equation was derived showing the relation among underdrainage discharge, water level at the laterals and main drain, and the quantity of storage water at the soil surface by using the relation of the underdrainage discharge and water logged area. This equation was express in finite difference and the calculations were carried out by the relaxiation method. This equation was confirmed by comparison with experimental data obtained for clayey paddy field. As an example of application of this theory, it is possible to carry out rational planning of the underdrainage system which could not be done before with the help of this theory since the equation takes into the consideration solution of problems which arise from the difference in quantity of ponded water at different paddy fields and also the time required for drainage.--Copyright 1974, Biological Abstracts, Inc.

CORRELATION BETWEEN THE SALT CONTENT IN THE HARD PHASE AND SOIL SOLUTIONS OF THE MURGHAB OASIS DESERT-MEADOW SOILS OF ANCIENT IRRIGATION, (IN RUSSIAN),
G. V. Vinogradova.
Probl Osvo Pustyn' 4, p 82-84, 1975.

Descriptors: *Salinity, *Saine soils, Ancient history, Deserts, *Irrigation, Meadows, Murchab, Oasis, Salts, Soils, Turkmen-SSR, USSR.

Comparison of data from analyses of aqueous extracts and soil solutions of Murghab oasis (Turkman SSR, USSR) soils indicated that the extracts and solutions differed significantly in total content of salts and individual ions. This difference was less expressed in the salinized soils, since easily soluble Na SO4 and MgSO4 and NaCl are found in the salts of these soils. In unsalinized soil, where the salts are represented by weakly soluble CaSO4, and calcium bicarbonate, the aqueous extract gave exaggerated indices, converting soil hard-phase components into solution during extraction. The greatest difference between the soil solutions and aqueous extracts was exhibited by HCO3, SO4 and Ca ions, which were greater in the aqueous extracts.--Copyright 1976, Biological Abstracts, Inc.

WATER AND PHYSICAL PROPERTIES OF THE SOD-CALCAREOUS SOILS OF THE CRIMEAN FOOTHILLS (IN RUSSIAN),
L. F. Kaplyuk.
Pochvovedenie 5, p 104-114, 1976.

Descriptors: *Calcareous soils, *Soil physical properties, Sods, Aggregates, Climates, Erosion, Forest, Leaching, Sites, USSR, Vegetation.

A description is given of the microclimate, physical geography, and aggregate properties and water constants of the sod-calcareous soils of the steppe-forest belt on the north slope of the Crimean Mountains (Ukrainian SSR, USSR) formed on the eluvial and eluvial-deluvial limestones, layers of covering gravel and other carbonate deposits. The soils vary in thickness, mechanical composition, degree of storminess, leaching and erosion due to wide variances in soil-forming factors, e.g., the characteristics of the complex mountain relief and plant cover. Highly skeletal and eroded soils exhibit unsatisfactory water and physical properties; more favorable conditions for forest cultures are found in areas with thick, weakly rocky soils or thin soils with small grained (melkozem) or weakly fragmented upper (arable) levels. Eroded, rocky soils containing little melkozem are unsuitable for forest seeding without preparatory improvement.--Copyright 1978, Biological Abstracts, Inc.

A LYSIMETRIC STUDY OF WATERS IN AN IRRIGATED PASTURE (IN RUSSIAN),
Moskovskaya Sel'skokhozyaistvennaya Akademiya (USSR). Div. of Meadow Science.
V. A. Tyuldyukov, and A. D. Prudnikov.
Izv Timiryazev S-Kh Adad 5, p 98-107, 1977.

Descriptors: Calcium, Grass, *Leaching, Magnesium, Nitrogen, *Nutrients, Phosphorus, Potassium, *Pastures, *Soil moisture, *Lysimetry, *Podzolic soils.

The effect of different moisture regimes of soddy-podzolic soils on vertical moisture filtration in the 1st meter of soil, pH and chemical composition of lysimetric waters, and leaching of the main mineral elements of grass nutrition were studied on the irrigated cultivated pasture of Moscow (USSR) region by means of lysimeters. Keeping the soil moisture at the 70% level of field capacity in the 0-40 layer cm ensures the lowest water filtration and insignificant leaching of N, P and K from the top meter. The most intensive nutrient leaching, especially of Ca and Mg, from the soddy-podzolic soil occurs in spring and autumn. Excessive moisture results in inefficient water utilization.--Copyright 1978, Biological Abstracts, Inc.

FIELD OBSERVATIONS OF THE MOISTURE REGIME OF A YELLOW-GREY EARTH (OTOKIA SILT LOAM) IN EASTERN OTAGO,
Department of Scientific and Industrial Research, Havelock North (New Zealand). Soil Bureau.
J. P. C. Watt.
Journal of Hydrology (New Zealand), Vol. 16, No. 1, p 53-72, 1977. 6 fig, 5 tab, 18 ref.

Descriptors: *Soil moisture, *Loam, *On-site data collections, *Moisture blocks, Silts, Moisture content, Moisture tension, Wilting point, soil horizons, Depth, Soil profiles, Gravimetric analysis, Bulk density, *New Zealand, Neutron probe.

The moisture regime of yellow-grey earths has been inferred qualitatively in the past from climate analysis and pedologic interpretation. In this study, quantitative information was obtained. Field measurements, collected over a 3-4 year period, of the moisture tension and moisture content regimes of a model Otokia silt loam (Tokomairiro soil set) site provided data on changes in both moisture status and storage opportunity. The overall regime is characterized by periods of high moisture tension (at or drier than wilting point) in the A and B horizons through summer, and periods of low moisture tension (at or wetter than field capacity) in most horizons in winter. Within the limited range of moisture tensions commanded by resistance block determinations were shown to be compatible. (Visocky-ISWS)

RELATIONSHIPS AMONG SOME PHYSICAL PROPERTIES OF SOIL (IN SLOVENIAN),
Vyskumny Ustav Rastlinnej Vyroby, Piestany (Czechoslovakia).
J. Kosik, and T. Mistina.
Ved Pr Vysk Ustavu Rastlinnej Vyroby Piestanoch (12), p 125-134, 1974.

Descriptors: *Soil physical properties, *Soil moisture, Bean, Birdsfoot, *Capillary water capacity, Red clover, Lucerne, Oats, *Porosity, Sainfoin, Sunflower, Trefoil, *Soil aggregates.

Soil moisture content, reduced specific volume of soil, total porosity, maximum capillary water capacity, coefficient of structure and median wt mean of water stable soil aggregates were investigated. The soils were grown to sainfoin, lucerne, red clover, birdsfoot trefoil, maize, sunflower, broad bean and oats. Correlation analysis was made of the mean values of soil properties under the particular crops to a depth of 40 cm. The coefficient of multiple correlation was significant in the following order: maximum capillary water capacity (0.612-0.763), reduced specific volume (0.815-0.951) and total porosity of soil (0.889-0.961). The coefficient of structure was highly significant under the group of perennial crops (0.578-0.701). Partial correlation coefficients or partial regression coefficients, except for negative correlation between the reduced specific volume and the total porosity of soil, demonstrate a positive relation between the coefficients of structure and the total porosity of soil under legumes. A positive relation was observed between the maximum capillary water capacity and the total porosity (under annual crops) and a negative correlation between the soil moisture content and the coefficient of structure (under sainfoin and birdsfoot trefoil).--Copyright 1978, Biological Abstracts, Inc.

SOLUTE TRANSPORT DURING ABSORPTION OF WATER BY SOIL: LABORATORY STUDIES AND THEIR PRACTICAL IMPLICATIONS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Environmental Mechanics.
D. E. Smiles, and J. R. Philip.
Soil Science Society of America Journal, Vol. 42, No. 4, p 537-544, July-August 1978. 4 fig, 1 tab, 14 ref.

Descriptors: *Infiltration, *Absorption, *Solutes, *Soil water movement, Leaching, Unsaturated flow, Soils, Soil water, Unsteady flow, Capillary action, Dispersion, Laboratory tests, Soil science, Solute transport.

An experimental study of solute transport during absorption into uniform horizontal soil columns was reported. Three pairs of experiments were performed. Each pair had a common initial moisture content (0.04, 0.1, or 0.15), with one experiment involving displacement of concentrated soil solution by dilute solution and the other, vice versa. In all experiments, both the soil solution content and the salt concentration preserved similarity in terms of distance divided by square root of time. This confirmed earlier observations that the longitudinal dispersion coefficient for the conditions of these experiments is effectively independent of volume flux density. The inferred dispersion coefficient was essentially independent also of the volumetric moisture content (at least in the range 0.18-0.28). It was approximately equal to the product of the volumetric moisture content and the molecular diffusivity of KCl in water. The practical implications of the work for field problems were explored, use being made of scaling theory for flow processes involving capillarity and viscous flow. It was concluded that, for the majority of field soils, solute transport during unsaturated flow of any practical duration may be described by a velocity-independent dispersion coefficient. This represents a very great simplification of the formulation, analysis, and prediction of solute transport in such systems. (Sims-ISWS)

A SOIL MOISTURE BUDGET MODEL ACCOUNTING FOR SHALLOW WATER TABLE INFLUENCES,
Purdue Univ., Lafayette, IN. Agricultural Experiment Station.
R. G. Stuff, and R. F. Dale.
Soil Science Society of America Journal, Vol. 42, No. 4, p 637-642, July-August 1978. 9 fig, 1 tab, 15 ref.

Descriptors: *Water balance, *Soil moisture, *Water table, *Model studies, *Indiana, Evapotranspiration, Capillary action, Moisture deficit, Moisture stress, Crops, Evaporation pans, Root zone, Corn(Field), Soil moisture extraction, Holding capacity.

Soil moisture balance programs developed on well-drained soils were found to be unsatisfactory for a soil underlain by shallow water tables, a condition typical of about 9 million acres of cropland in Indiana. Capillary rise past a 105-cm root zone boundary was estimated as the difference between estimated evapotranspiration (ET) and changes in soil moisture under corn on a tile-drained Typic Argiaquoll at West Lafayette, Indiana, during 3 growing seasons, 1971-1973. Capillary water was found to supply an average of 27% of the ET in periods with little or no precipitation. Computer model estimates showed capillary water to furnish about 17% of the total ET over a 100-day period from 49 days before silking to 50 days after. The derived relationships with those obtained from literature sources and assumptions regarding runoff and recharge were programmed in a computer model for simulating the daily moisture status and changes in the corn root zone. Model inputs were pan evaporation, precipitation, soil moisture characteristics, corn silking date, and initial soil moisture conditions. The model was found to closely track measurements of both soil moisture and water table depths in 4 independent seasons: early and late plantings in 1970 and 1974. (Visocky-ISWS)

WATER RELATIONS OF FRITTED CLAYS,
Texas A and M Univ., College Station. Dept. of Soil and Crop Sciences.
C. H. M. van Bavel, R. Lascano, and D. R. Wilson.
Soil Science Society of America Journal, Vol. 42, No. 4, p 657-659, July-August 1978. 3 fig, 6 ref.

Descriptors: *Clays, *Materials, *Plant growth substances, Properties, Hydraulic conductivity, Bulk density, Water content, Drainage, Porous media, Porosity, Soils, Soil properties, Soil water, Materials testing, Soil science, *Fritted clay, Plant-available water.

Experiments and calculations were performed to characterize the water relations of fritted clay, a material which has been found suitable for growing experimental plants. Fritted clay dry bulk density is 0.67 kg/liter, particle density 2.50 kg/liter, total porosity 0.73, and saturated hydraulic conductivity 0.00095 m/sec. The desorption relation was measured, and the unsaturated hydraulic conductivity as a function of water content was calculated. Much water drains from the saturated material by gravity. After drainage from commonly used containers, the material holds 0.31 by volume of plant-available water, and has an air-filled porosity of 0.28. Its water relations are excellent for plant growth purposes. (Sims-ISWS)

PROFILE ACCUMULATION OF FERTILIZER-DERIVED NITRATE AND TOTAL NITROGEN RECOVERY IN TWO LONG-TERM NITROGEN-RATE EXPERIMENTS WITH CORN,
Iowa Agricultural and Home Economics Experiment Station, Ames.

V. D. Jolley, and W. H. Pierre.
Soil Science Society of America Journal, Vol. 41, No. 2, p 373-378, March-April 1977. 1 fig, 5 tab, 26 ref.

Descriptors: *Fertilizers, *Fertilization, *Nitrates, Nitrogen, *Corn(Field), *Crop response, Soils, Soil investigations, Soil profiles, Denitrification.

Two long-term N-rate experiments with corn which had been conducted in northwestern Iowa on the Moody and Galva silty clay loam soils for 17 and 15 years, respectively, were studied to determine the recovery of applied N (i) as NO3(-)N at various soil depths, (ii) as organic or fixed N, and (iii) as N removed in the harvested corn gran. The annual N rates applied as NH4NO3 were 0, 56, 112, and 168 kg N/ha on the Moody soil and 0, 90, and 134 kg N/ha on the Galva soil. Nitrogen recovery in the fertilized plots was determined by subtracting the amounts for the unfertilized treatment from those for the fertilized treatments. (Skogerboe-Colorado State)

GENERATION AND PROPAGATION OF DOWNWELLING FRONTS,
Canada Centre for Inland Waters, Burlington (Ontario).
T. J. Simons.
Journal of Physical Oceanography, Vol. 8, No. 4, p 571-581, July 1978. 19 fig, 22 ref.

Descriptors: *Water circulation, *Lake Ontario, *Winds, *Great Lakes, *Model studies, Mathematical models, Lakes, Circulation, Internal waves, Currents(Water), Limnology, Downwelling, Downwelling fronts, Fronts(Water).

The dynamics of downwelling fronts observed along the steep and elongated southern shore of Lake Ontario were investigated by considering the nonlinear response to surface forcing of one-layer and two-layer fluids on a rotating, semi-infinite plane. Analytical and numerical solutions for idealized situations exhibited typical characteristics of the observed fronts such as offshore propagation and periodic recurrence with near-inertial periods. A numerical simulation of an acutal downwelling episode in Lake Ontario showed that this type of model reproduces the observed behavior of the thermocline as well as the associated oscillatory currents. It was concluded that the fronts are to be visualized as internal surges associated with the oscillatory rather than the quasi-geostrophic response of a lake to wind. (Sims-ISWS)

NUMERICAL COMPUTATION OF THREE-DIMENSIONAL CIRCULATION IN LAKE ERIE: A COMPARISON OF A FREE-SURFACE MODEL AND A RIGID-LID MODEL,
Case Western Reserve Univ., Cleveland, OH.
Y. P. Sheng, W. Lick, R. T. Gedney, and F. B. Molls.
Journal of Physical Oceanography, Vol. 8, No. 4, p 713-727, July 1978. 16 fig, 23 ref.

Descriptors: *Water circulation, *Lake Erie, *Great Lakes, *Model studies, Mathematical models, Computer models, Circulation, Currents(Water), Winds, Seiches, Remote sensing, Satellites(Artificial), Eddies, Flow, Limnology, Free-surface models, Rigid-lid models.

The three-dimensional, time-dependent flow in the Western Basin of Lake Erie has been calculated numerically by means of both a two-mode free-surface model and a rigid-lid model. Detailed comparisons of the results from these two models were presented for two wind conditions: (1) a constant wind suddenly imposed, and (2) an actual wind which is variable in both space and time. For relatively short time intervals, significant differences between the results of the two models occur since the seiche motion was eliminated in the rigid-lid model. Long-term, time-averaged circulation computed by the two models agreed well in periods of strong wind, but differed appreciably in periods of light wind and active seiching. (Sims-ISWS)

SURVIVAL AND OXYGEN CONSUMPTION OF YOUNG KURA CARP UNDER VARIOUS KEEPING CONDITIONS (IN RUSSIAN),
Tsentralnyi Gosudarstvennyi Nauchno-Issledovatelskii Inst. Ozernogo i Rechnogo Rybnogo Khozyaistva, Baku (USSR). Azerbaijan Branch.
T. A. Askerov.
Gidrobiol Zh 11(3), p 76-77, 1975.

Descriptors: *Carp, Kura carp, Larvae, *Oxygen consumption(Carp), *Salinity, Survival, Temperature, Juveniles, Fish hatcheries.

Experiments were carried out on Kura River carp (Cyprinus carpio) to establish the minimum O2 content for survival of the larvae and fry under hatchery conditions, the upper limit of salinity, activity of the fry at different temperatures and salinities and the temperature optimum of the juveniles. Salinity above 4% on larvae and above 6% on fry had an inhibiting effect. Fry at an age of 38 days preferred a water temperature of 27C. O2 consumption per unit time by the fry decreased with decreasing 0 saturation.--Copyright 1976, Biological Abstracts, Inc.

THE HISTORIC LEVEL OF GREAT SALT LAKE, UTAH,
Geological Survey, Salt Lake City, UT., Water Resources Div.
T. Arnow, and L. J. Jensen.
In: Desertic Terminal Lakes; Proceedings of the International Conference on Desertic Terminal Lakes, held in Ogden, Utah, May 2-5, 1977, p 73-79, 1977. 6 fig, 4 ref.

Descriptors: *Great Salt Lake, *Utah, *Water level fluctuations, Hydrology, Inflow, Evaporation, Consumptive use, Railroads, Bridges, Effects, Data collections.

The level of Great Salt Lake, Utah, fluctuates continuously in response to climatic changes and tends to maintain an equilibrium between inflow from surface and ground water and precipitation and loss by evaporation. For the period 1847-75, the surface level was computed indirectly; during 1875-1938, the level was measured periodically at staff gages; and since 1938, the level has been measured continuously. During the 130 years of record, the lake has fluctuated over a range of 20 feet. The consumptive use of water as a result of man's activities in the Great Salt Lake drainage basin since 1847 has resulted in a lowering of the lake level by 5 feet. Since 1959, a railroad causeway has separated the lake into two parts. Although the causeway is permeable and is breached by two 15-foot wide box culverts, it has caused a difference in surface level between the two parts of the lake. The maximum recorded difference of level was 2.35 feet in June 1975.

Vopr Ikhtiol 17(1): 72-79. 1977 (In Russ. with Russ. summ.)

Descriptors: *Nutrient requirements, *Fish diets, Lakes, Ponds, Zooplankton, Phytoplankton, Aging(Biological), Fry, Diets, Detritus, *Bighead, Russian-SFSR, USSR, Yearlings.

The basic food component of A. nobilis larvae of stages III-IV in ponds and lakes of the Dagestan ASSR (Russian SFSR, USSR) was zooplankton. The role of zooplankton decreased and that of phytoplankton increased as the fish grew older. As a result of poor zooplankton reserves in the studied areas, fingerlings and yearlings were, in the majority of cases, undersupplied with animal food, and sometimes changed over completely to phytoplankton and detritus. The latter comprised 82-99% of the food weight.-Copyright (c) 1978, Biological Abstracts, Inc.

2I. Water In Plants

STOMATAL AND NONSTOMATAL REGULATION OF WATER USE IN COTTON, CORN AND SORGHUM,
Texas Tech Univ., Lubbock. Dept. of Plant and Soil Science.
R. C. Ackerson, and D. R. Krieg.
Plant Physiology, Vol. 60: p 850-853, 1977. OWRT C-6273(No 5225)(5), 14-31-0001-5225.

Descriptors: *Drought resistance, *Drought tolerance, Moisture availability, *Enzymes, *Moisture stress, *Photosysthesis, *Stomata, Osmotic pressure, Turgidity, Growth stages, *Corn(Field), *Cotton, *Sorghum.

Stomata of corn (Zea mays L.) and sorghum (Sorghum bicolor L.) responded to changes in leaf water potential during the vegetative growth phase. During reproductive growth, leaf resistances were minimal and stomata were no longer sensitive to bulk leaf water status even when leaf water potentials approached -27 bars. Stomata of corn, cotton (Gossypium hirsutum L.), and sorghum appear to respond to changes in the humidity deficit between the leaf and air and in this manner, regulated transpirational flux to some degree. Distinct differences in water transport efficiency were observed in the three species. Under nonlimiting soil water conditions, sorghum exhibited the greatest efficiency of water transport while under limiting soil moisture conditions, cotton appeared most efficient. Corn was the least efficient with respect to non-stomatal regulation of water use. Differences in drought tolerance among the three species are partially dependent on stomatal regulation of water loss, but efficiency of the water transport system may be more related to drought adaptation. This is particularly important since stomata of all three species did not respond to bulk leaf water status during a large portion of the growing season.

WATER RELATIONS AND PHYSIOLOGICAL ACTIVITY OF POTATOES,
Texas Tech Univ., Lubbock. Dept. of Plant and Soil Science.
R. C. Ackerson, D. R. Krieg, T. D. Miller, and R. G. Stevens.
Journal of the American Society for Horticultural Science, Vol. 102, No. 5 p 572-575, 1977 4 fig, 1 tab, 17 ref. OWRT C-6273(No 5225)(4).

Descriptors: *Drought resistance, *Drought tolerance, *Moisture availability, *Enzymes, *Moisture stress, *Photosynthesis, *Stomata, Turgidity, Growth stages, *Potatoes.

The effects of varying degrees of water stress on internal water potential components and specific physiological processes were investigated in field grown potatoes. Leaf water potential was not directly related to soil water potential until a specific minimum soil water potential was attained. Subsequently, leaf water potentials did not increase in response to increases in soil water potential. The specific trends in plant water potentials are discussed in relation to the possible involvement of tubers in regulating water flux. Water stress had pronounced effects on physiological processes such as stomatal resistance, photosynthesis and possibly enzyme activity. A decline in leaf water potential was apparently responsible for increased stomatal resistance and decreases in photosynthetic rate. The activities of ribulose di-phosphate carboxylase and phosphoenolpyruvate carboxylase were observed to decrease as leaf water potential declined. The realationship between water stress and physiological processes and the inability of leaf water potentials to respond to increases in soil water potential after a maximum stress may partially explain the extreme sensitivity of potatoes to even mild water stresses.

GROWTH ASPECTS OF GREEN ASH SEEDLINGS IN YEARS VARYING IN MOISTURE (IN RUSSIAN),
Saratov Agricultural Inst. (USSR).
A. I. Peretyatko, and N. I. Fedorov.
Lesovedenie 4, p 75-79, 1975.

Descriptors: *Dry matter, Vegetation, Roots, *Green ash, *Growth rates, *Moisture, Seedlings.

Processes of dry matter accumulation in the whole plant and separate organs are rhythmical. The main part of dry mass accumulates in the 1st half of vegetation. Roots of the 1st order appear at the phase of the 1st pair of true leaves, the 2nd ones at the phase of 2 pairs, the 3rd at 5 pairs, the fourth at 11-13 pairs of leaves. The main part of the seedling root system consists of lateral roots 10-20 and 21-30 mm long.

EFFECT OF ENVIRONMENTAL FACTORS ON THE DISTRIBUTION OF CADDIS FLY LARVAE IN SMALL RIVERS (IN RUSSIAN),
Yaroslavskii Gosudarstvennyi Pedagogicheskii Inst. (USSR).
E. F. Nikishina, L. A. Vetrova, T. L. Alekseeva, and G. F. Golubeva.
Ekologiya 5(5), p 40-43, 1974.

Descriptors: *Caddis-fly, Chaetopteryx-villosa, Cyrnus-flavidus, *Distribution, Economus-tenellus, Environmental, Goera-pilosa, Hydropsyche-pellucidula, *Larvae, Limnophilus-flavicornis, Mystrophora-intermedia, Orthotrichia-tetensii, Oxyethira-costalis, Phryganea-grandis, Phryganea-striata, Polycentropus-flavomaculatus, Rhyacophila-nubila, Rhyacophila-septentrionis, Rivers, Silo-pallipes, Soil, USSR.

The distribution of caddisfly larvae was studied in the Rivers Goretovka (Moscow Oblast), Solonitsa (Yaroslavi Oblast), and Kolodnyanka (Smolensk Oblast) (USSR), considering physical and geographic factors. The Goretovka River showed the following ecological groups: psychrophilic rheophilic (Rhyacophila septentrionis, Hydropsyche pellucidula), lithorheophilic (Polycentropus flavomaculatus, Silo pallipes, Goera pilosa, Chaetopteryx villosa), psammorheophilic (Phyganea striata, P. grandis) and pelite-rheophilic (Limnophilus flavicornis). The Solonitsa River shows lithorheophilic Mystrophora intermedia, Ecnomus tennelus and L. flavicornis and phytophilic Oxyethira costalis, E. tennelus, Cyrnus flavidus and Orthotrichia tetensii. The weakly mineralized and hydrocarbonate, Kolodnyanka River showed 12 caddis fly species, of which H. pellucidula, Rhyacophila nubila, and S. pallipes were predominant. Although the Rivers Goretovka and Kolodnyanka belong to different basins, the caddisfly fauna in these 2 rivers was similar. This may be due to similar bottom soil, current speed, and similar chemical composition. The Solonitsa River belongs to the Volga basin, as does the Goretovka. However, the caddisfly fauna composition is different in the 2 rivers. This is due to the unique chemical composition of the water and hydrologic system of the Solonitsa River.

NITRATE REDUCTASE ACTIVITY OF SOYBEANS IN RELATION TO OTHER INDICATORS OF WATER STRESS,
Kansas Water Resources Research Inst., Manhattan.
R. Manam, I. D. Teare, W. L. Powers, and E. L. Skidmore.
Phyton, Vol. 35, No. 2, p 189-194, 1977. 3 fig, 12 ref. OWRT A-060-KAN(2).

Descriptors: Irrigation, *Bioindicators, *Soybeans, Water stress, *Nitrate reductase, Irrigation scheduling.

In vivo nitrate reductase activity (NRA) was monitored in soybeans (Glycine max L. Merr. cv. Calland) and compared to physiological age and to the following physical and physiological indicators of water status in plants and soil: leaf water potential (psi L), stomatal resistance (Rs adaxial), and soil water potential (psi s). NRA was high in vegetative stage, gradually reduced until bloom stage, and then fell rapidly during pod stage onward in non-stressed plants. In stressed plants NRA started falling rapidly early in bloom stage. NRA decreased rapidly when psi leaf decreased below -8 bars but adaxial stomata did not begin to close until psi leaf decreased below -16 bars. Leaf water potential is related to psi soil. NRA decreased when psi soil decreased below -2 bars and adaxial stomata began closing at -7 bars. From these results it is concluded that NRA responded to water stress very early in relation to stomatal resistance and was too sensitive to be used as a tool for irrigation scheduling.
W79-00149

PROGRESS AND PROBLEMS IN THE STUDY OF PLANT-WATER INTERRELATIONS (IN BULGARIAN),
P. Kramer.
Fiziol Rast (Sofia) 2(4), p76-91. 1976.

Descriptors: *Soil-water-plant relationships, *Consumptive use, *Reviews, Model studies, Computer models, Transpiration, Stomata.

Very early studies and studies done at the beginning of the 20th century on plant-water interactions are briefly mentioned, followed by detailed review of more recent contributions in this area. These latter have included progress in the study of water stress measurement, water absorption, the cohesion theory, the concept of a soil-plant-atmosphere unity, modeling and computer simulation, transpiration and stomatal behavior and antitranspirants. Many interesting problems remain to be studied, including root function, resistance to water flow in plants and the soil, the effect of water deficit and drought resistance.--Copyright 1978, Biological Abstracts, Inc.

VEGETATION OF SOUTHEASTERN FLORIDA -- PARTS II - V,
Florida Atlantic Univ., Boca Raton. Dept. of Biological Sciences.
D. F. Austin, K. Coleman-Marois, and D. R. Richardson.
Florida Scientist, Vol. 40, No. 4, p 331-361, Fall, 1977. 9 fig, 80 ref.

Descriptors: *Florida, *Vegetation, Drainage, Urbanization, Effects, Marshes, Mangroves, Wetlands, Hammocks.

II. Boca Raton Hammock, a tropical hammock on a barrier island, was originally bordered on the west by a freshwater sawgrass marsh which became overgrown by mangrove following drainage. Strand vegetation dominated by saw palmetto has persisted for at least a century. III. Yamota Scrub has undergone few successional changes for the past century despite its near extirpation because of agriculture and urbanization. IV. Butts Hammock is an inland hammock with 73% tropical species. Due to drainage in 1921 and urbanization of this area, all of the wet prairie formerly north of the hammock has disappeared; the majority of the swamps west of the hammock and all of the dry prairies are gone. Most of the hammock itself still remains. V. Boca Raton Inlet has undergone several changes in physiography and vegetation in the past with three major changes in the last 100 years. Increased salinity has resulted in the spread of mangroves, and disturbance has resulted in the establishment of exotic plant species. (Stihler-Mass)

CATTAILS (TYPHA SPP.)--WEED PROBLEM OR POTENTIAL CROP.,
Miami Univ., Coral Gables, FL.
J. F. Morton.
Economic Botany, Vol. 29, No. 1, p 7-29, January-March, 1975. 10 fig, 158 ref.

Descriptors: *Cattails, *Aquatic weeds, *Reviews, Value, *Utilization, Rooted aquatic plants, Foods, Feeds, Construction materials, Wildlife, Pollen, Leaves, Seeds, Oilseed crops, Toxicity, Floss.

Cattails, which are subject to vigorous control measures in many parts of the world, deserve study with respect to industrial utilization as an alternative to destruction. Various uses of cattails reported in the literature are reviewed. Cattail stands provide food and cover for wildlife. They have been cultivated as ornamental plants and to control erosion. As a construction material, cattail stems and leaves have been used to make various objects ranging from sandals to sailboats; the cuticle of the stem has been used for weaving; sheaths cut in the fall have been used to caulk barrels. Fibers can be extracted from leaves and stems. Cattail leaves and stems are suitable for papermaking producing a paper which is rather strong but difficult to bleach. Cattail floss has a wide array of uses including stuffing for cushions and use as an insulating and sound-proofing material. The heart of young plants, rootstocks, rootstock sprouts, flower spikes, pollen and seeds have been used as human and animal foods. Various parts of the plant have been used for medicinal purposes. Cattail seeds yield a drying oil. Cattails have, on various occasions, been reported as toxic to humans and animals. (Stihler-Mass)

ET MEADOWS IN SOUTHERN SWEDEN: EGETATION, SUCCESSION AND MANAGE- ENT (IN SWEDISH),
und Univ. (Sweden). Dept. of Ecological Botany.
. Larsson.
edd Avd Ekol Bot Lunds Univ (31), p 1-107, 76.

escriptors: *Sweden, *Meadows, Lake shores, Vegetation, Flooding, Water table fluctuation, arex-Acuta, Cattle, Deschampsia-Caespitosa, cology, Filipendula-Ulmaria, Fire, Floristics, rass, Grazing, Hay, Herbs, History, Literature, oils, Waterfowl.

Vet meadows frequently occur along riversides nd lake shores in southern Sweden. They are in- uenced by a high water table or periodic oodings. Physiognomically they are dominated y tall species such as Deschampsia caespitosa, arex acuta or Filipendula ulmaria, though small erbs and grasses are also important components f the vegetation. The general character of the wet eadow varies with soil, water regime and the in- uence of man and cattle, providing different ypes of habitats for waterfowl. The floristic elimitation of these meadows is discussed and a hort account of the historical development is iven. The literature is surveyed. The floristic omposition of the wet-meadow vegetation is sum- arized and ecological species groups are distin- uished using vegetation analyses. The ecological ffects of management (hay-making, grazing, fire) are briefly discussed. Suggestions for the restoration and management of wet meadows are given.--Copyright 1978, Biological Abstracts, Inc.

MECHANICAL CHARACTERISTICS OF DEBRIS FLOW,
Kyoto Univ. (Japan). Disaster Prevention Research Inst.
T. Takahashi.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY8, Proceedings Paper 13971, p 1153-1169, August 1978. 12 fig, 9 ref.

Descriptors: *Bed load, *Bores, *Sediments, Fluid mechanics, Velocity, Hydraulics, Sediment transport, Overland flow, Profiles, *Debris flow, Nonstationary bed flow.

A mechanism of occurrence of bore-like debris flow due to the appearance of overland flow on the debris accumulation was considered using the applying shear stress and resisting stress relationship in the bed. The criteria for the occurrence of the nonstationary bed flow and the partly stationary bed flow were made clear. The partly stationary bed flow approaches a quasi-steady state, whose depth, velocity and concentration are predictive applying the concept of dilatant fluid introduced by Bagnold. Although the front height of the nonstationary bed flow increases versus distance, the translation velocity and concentration are nearly constant, and flow characteristics are theoretically predictive by some appropriate assumptions. (Lee-ISWS)

SCOUR OF BED MATERIAL IN VERY ROUGH CHANNELS,
Technical Univ. of Istanbul (Turkey). Dept. of Hydralic and Water Power.
M. Bayazit.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY9, Technical Note, p 1345-1349, September 1978. 3 fig, 2 ref, 1 append.

Descriptors: *Scour, *Laboratory tests, *Bed load, Sediment transport, Channels, Running waters, Movement, Roughness(Hydraulic), Analytical techniques, Analysis, Equations, Rough channels.

Experiments with densely packed uniform spheres have confirmed that the initiation of motion of bed material is affected by the relative roughness of the channel. At shallow depths, larger values of the Shields' parameter are required to initiate the motion. This was explained by the reduction of nondimensional velocities, u/u sub *((velocity of flow in vicinity of particle)/(bed shear velocity)), at the bed level with the increase of d/h((characteristic particle size)/(flow depth)). The effective value of the instantaneous flow velocity is achieved at higher bed shear stresses in comparison with flows at mild slopes. (Humphreys-ISWS)

MEASUREMENTS OF BED LOAD IN OSCILLATORY FLOW,
Cambridge Univ. (England). Dept. of Engineering.
J. F. A. Sleath.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol 104, No WW4, Proceedings Paper 13960, p 291-307, August 1978. 11 fig, 1 tab, 18 ref, 2 append.

Descriptors: *Bed load, *Sediment transport, *Laboratory tests, *Flow, Sedimentation, Analytical techniques, Measurement, Laboratory equipment, Hydraulic models, Movement, Currents(Water), Waves(Water), Beaches, Shore protection, Hydrodynamics, Erosion, Coastal engineering, Testing, Methodology, Oscillatory flow.

Measurements have been made of the quantities of sediment moving as bed load in oscillatory flow over a flat bed. Most of the measurements were made with an oscillating tray in still water, but some were carried out in a wave flume. There was good agreement between the two sets of results. For sand and gravel, the mean sediment transport rate was observed to vary during the course of the cycle like the fourth power of the velocity of oscillation, but with a slight phase lead. For nylon pellets, however, made of the random fluctuations in transport rate, and these were compared with AbouSeida's theoretical model. The agreement was poor for the beds of sand and gravel but reasonable for the nylon pellets. An empirical relationship was derived for the sediment transport rate. (Humphreys-ISWS)

ORIGIN AND TRANSPORT OF LARGE BOULDERS IN MOUNTAIN STREAMS,
Ministry of Works and Development Christchurch (New Zealand). Water and Soil Research.
G. A. Griffiths.
Journal of Hydrology (New Zealand), Vol. 16, No. 1, p 1-6, 1977. 1 fig, 12 ref.

Descriptors: *Streams, *Mountains, *Boulders, Movement, Scour, Erosion, Rocks, Streamflow, Loads(Forces), Model studies, Mathematical models, Hydrology, Mountain streams, Boulder transport.

The means by which boulders of the order of meters in diameter appear in mountain stream beds was reviewed briefly. It was asserted that downstream translation under the action of direct fluid stress is unlikely. However, a combination of fluid stress and localized scour may effect small near-vertical displacements. Undermining of the stream bank upon which a boulder is perched has the potential to precipitate translation movements several diameters in extent, but the frequency of such incidents is probably not commensurate with the boulder's endurance to size reduction. Therefore, it was supposed that, as a rule, the net translation achieved by a large boulder during a streambed history of ordinary flood events can be measured in tens of meters. Where larger translations are in evidence, this may indicate that catastrophic events, such as natural dam breaks or in-channel debris flows, have occurred. (Sims-ISWS)

DETERMINATION OF SPOIL-BANK EROSION RATES IN OHIO BY USING INTERBANK SEDIMENT ACCUMULATIONS,
Ohio State Univ., Columbus. Dept. of Geology and Mineralogy.
G. D. McKenzie, and J. R. J. Studlick.
Geology, Vol 6, p 499-502, August 1978. 4 fig, 3 tab, 7 ref.

Descriptors: *Spoil banks, *Erosion rates, *Ohio, Sedimentation rates, Weathering, Leaching, Pollutants, Strip mine wastes, Slopes, Vegetation effects, Interbank accumulation, Universal soil-loss equation.

Denudation rates of unvegetated spoil banks in Gallia County, Ohio, were determined using sediment volumes and specific weights in 4 small interbank basins. Calculated rates are higher than those reported from other strip-mined areas because the spoil is unvegetated and consists mainly of friable sandstone. Spoil-bank slopes had erosion rates of 35,000 to 71,000 tons/sq km/yr (metric tons per square km per year) with an equivalent surface degradation of 2.6 to 5.4 cm/yr (cm per year). These rates show good correlation with mean slope length, which ranged from 5.8 to 12.8 m. Rates may be higher than calculated owing to loss of material by chemical weathering and subsequent leaching. The study demonstrated the suitability of simple measurements in interbank depressions to obtain average annual erosion rates for drastically disturbed landscapes. (Visocky-ISWS)

Alvarado is a typical coastal lagoon, about 27 km long and 5 km wide, located in the southeastern part of the state of Veracruz, Mexico. It is connected to the Gulf of Mexico by the Papaloapan River. The lagoon is flooded with freshwater during the rainy season, and significant hydrological differences are observed between rainy and dry

sons. The surface-bottom chlorinity gradient raged 8.0% in April, 1966; 0.9% was recorded uly. Surface-bottom dissolved O2 values from ml/l in May to 7.6 ml/l in August. Surface water perature ranged from 34.0C in May-18.1C in . Meristic and morphometric data are provided 311 fishes, representing 60 spp. in 29 families, ected in Laguna de Alvarado. The majority are arine forms present throughout the year but ie marine and freshwater species are also resented. The latter, normally confined to ams and rivers of the drainage basin, enter the una in some numbers during the rainy season. collection includes 56% of the species which commercially important or locally utilized for d.

e natural exchange of gases across an air-water erface is an important mechanism that can be antified. The mass-transfer coefficients characizing the liquid phase can be predicted using tain models representing the liquid phase turbuice. Methods were developed to approximate necessary input parameters. Predictions of the dels yielded liquid-phase mass-transfer coeffints well within an order of magnitude of experintal data at air-water interfaces. (Sims-ISWS)

Irregular grid finite-difference techniques lead to equations similar to those obtained using finite-element techniques. The simpler finite-difference equations offer the advantage of greater computational economy. The time-implicit, finite-element equations must be inverted at each time step, and the maximum size of the time step is only half that which can be used with the finite-difference equations. Both techniques result in instabilities when used with highly irregular grids, and the finite-element equations are also unstable if the basin is variable. Although the finite-element results are better when compared with finite-difference results from the same grid, comparable finite-difference results can be obtained using a finer grid at less computational expense. ON GEOSTROPHIC ADJUSTMENT IN SEA STRAITS AND WIDE ESTUARIES. PART I: ONE-LAYER SYSTEM,
Wisconsin Univ.-Madison. Dept. of Meteorology.
D. Nof.
Journal of Physical Oceanography, Vol. 8, No. 4, p 690-702, July 1978. 8 fig, 17 ref, 1 append. NOAA 04-3-158-61.

Descriptors: *Discharge(Water), *Estuaries, *Straits, *Model studies, Mathematical models, Laboratory tests, Flow, Currents(Water), Water circulation, Coriolis force, Channel flow, Coasts, Tidal waters, Oceans, Oceanography.

The dynamics of outflows from sea straits and wide estuaries were examined through a simplified frictionless model whose primary motions are not constrained to be quasi-geostrophic. The potential vorticity equation was solved by means of approximate analytical methods. Some of the model predictions were tested in the laboratory. The mathematical model predicts that an outflow from a channel with uniform velocity distribution deflects to the right or left, depending on the depth of the basin into which it debouches. There is a 'critical' Rossby number below which the flow separates from one of the basin banks. When a non-uniform velocity is introduced upstream, the direction of deflection may differ substantially from the upstream uniform flow case. The model showed that rotation is important whenever the ratio between the relative depth variation to the Rossby number is not negligible; rotational effects can be important even if the ratio between the channel width and the Rossby deformation radius is entirely negligible. An experimental system consisting of a rotating channel with an abrupt cross sectional variation was used in the laboratory to test the theory. Deflections resulting from 'supercritical' conditions were tested qualitatively with favorable results. (Sims-ISWS)

INERTIAL CURRENTS OVER THE INNER SHELF NEAR 30 DEGREE N,
Louisiana State Univ., Baton Rouge, Coastal Studies Inst.
E. Daddio, W. J. Wiseman, Jr., and S. P. Murray.
Journal of Physical Oceanography, Vol. 8, No. 4, p 728-733, July 1978. 3 fig, 21 ref.

Descriptors: *Currents(Water), *Coasts, *Continental shelf, *Louisiana, *Gulf of Mexico, Model studies, Mathematical models, On-site investigations, Current meters, Tidal waters, Shallow water, Winds, Circulation, Water circulation, Oceanography, Inertial currents, Inner shelf.

Analysis of two month-long current records, one in February and one in May, from the inner shelf (28.9 deg N) west of the Mississippi River delta showed strong oscillations in the diurnal-inertial frequency band. Lack of correlation of these currents with the predicted or measured tide and stron association with frontal passages suggest that they are wind-induced inertial oscillations. The observed oscillations were well reproduced by a time-dependent wind-driven model, including Coriolis acceleration and friction. (Sims-ISWS)

Descriptors: Bays, *Bay of Bourgneuf(Fr), Hydrogen ion concentration, *Oyster ponds, Ecology, *Oysters, *Diatoms, France, Navicula-ostrearia, *Salinity, *Temperature.

In Bourgneuf bay (France), oysters are immersed in sea basins called oyster ponds, where proliferation of the diatom Navicula ostrearia Bory at the blue pigmented stage leads to the greening. Three ecological factors in a pond (temperature, salinity, pH) were studied together with climatic factors of temperature and rain. The relative isolation of this environment explained diurnal and seasonal fluctuations of the 3 studied factors. A defined diurnal thermic amplitude preceded and signalled the greening phase of the basin; during this period, pH increased and oscillated at about 8.2.--Copyright 1978, Biological Abstracts, Inc.

A technique was developed that leads to an optical classification of natural waters in terms of the dissolved and suspended biogenous material present. As a first approximation, this classification was made in terms of the total chlorophyll-like pigment concentration. A relationship between the spectral diffuse attenuation coefficient for irradiance and the chlorophyll-like pigment concentration was found with spectral irradiance data for diverse types of ocean waters. The specific spectral attenuation coefficient due to phytoplankton was shown to be consistent with laboratory measurements of the diffuse absorption coefficient of various lot cultures of phytoplankton. REGIONAL RESPONSE TO FORCING IN SOUTHERN STRAIT OF GEORGIA,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
J. D. Schumacher, C-A. Pearson, R. L. Charnell, and N. P. Laird.
Estuarine and Coastal Marine Science, Vol. 7, No. 1, p 79-91, July 1978. 10 fig, 1 tab, 14 ref.

Descriptors: *Straits, *Currents(Water), *Tidal effects, *Water circulation, *Canada, Estuaries, On-site investigations, Velocity, Current meters, On-site data collections, Data collections, Surveys, Tidal waters, Water temperature, Winds, Hydrography, Salinity, Convection, *British Columbia, *Strait of Georgia(Canada), Two layered flow.

Current meter, STD, and wind data were presented to describe late winter (February-April) mean circulation in the southern Strait of Georgia. The circulation scheme was dominated by strong outward (southeast) flow on the western side of the strait. On the eastern side there was a weaker northwest flow. Mean speeds within a 95% confidence interval from near-surface (5 m) current records were observed to be 16 + or - 7 cm/s toward the south-southeast in the center of the strait, 26 + or - 5 cm/s toward south-southeast in Boundary Pass, and 3.7 + or - 2.5 cm/s toward the northwest on the eastern side. Oceanic waters enter the region at depth through Haro Strait in response to Fraser River runoff at the surface. Superposition on this flow of strong tidal current signal results in augmentation of the flood on the eastern side of the ebb on the western side; however, there is no net tidal northward flow through Rosario Strait. The wind field during this experiment was generally uniform throughout the region. Although winds were uniform, response was not. The deep waters on the western side have relatively little response to wind, and gravitational convection is the dominant driving mechanism. On the shallow eastern side, wind was concluded to be the dominant mechanism driving mean circulation. (Humphreys-ISWS)

Descriptors: *Connate water, *Tidal marshe *Mississippi, *On-site investigations, Water qua ty, Marshes, Salinity, Saline water, Marsh plant Data collections, On-site data collection Hydrogen ion concentration, Bays, Surfa waters, Juncus roemerianus, Spartina cynos roides.

The salinity of interstitial water (i.e., the salinity the free soil water) was examined at 11 equidista stations along a transect on a Mississippi tid marsh dominated by Juncus roemerianus a Spartina cynosuroides. Changes in the nearby su face water (e.g., bay water) were reflected in t changes in interstitial water salinity. The salini of interstitial water was usually higher, varyi between 2.5 and 15.8 parts per thousand fro February 1975 through January 1976, than t salinity of the nearby surface water which rang from 0.0 to 11.5 parts per thousand. Following long period of high salinity in the bay and sou (exceeding 14 parts per thousand), the salinity the interstitial water increased to a maximum 16.8 parts per thousand in October. The salinity i creased as the distance of the sampling statio from the source of the flood water increase Mean interstitial water salinity across the mar studied was within 10 parts per thousand, whic did not seem to influence the marsh plant zonatio occurring on the marsh. THE EFFECT OF REDUCED WETLANDS AN STORAGE BASINS ON THE SIZE, STABILIT AND PRODUCTIVITY OF THE WATERSHE MIXING ZONE,
Connecticut Univ., Storrs. Inst. of Wat Resources.
B. L. Welsh.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-288 22 Price codes: A03 in paper copy, A01 in microfich Research Project Technical Completion Repor 1978. 43 p, 9 tab, 18 fig, 22 ref. OWRT A-06 CONN(1). 14-31-0001-5007.

Descriptors: *Estuaries, Management, Urbaniz tion, Watershed management, *Salinity structure Benthic productivity, Stability watershed system *Mixing zones, Freshwater flow, Reduced we lands/storage basins, *Connecticut.

Three watershed systems in southeastern Conne ticut were compared to determine whethe changes in their wetlands and storage basins coul have resulted in an expansion of the estuarine mi ing zone with subsequent losses in benthic produc tivity. In Alewife and Jordan Cove system

astic changes in salinity structure following rain-
orms caused the mixing zone to oscillate over
ly half the total area of the estuary. Beneath this
ne, flocculent silt-clay sediments (80%-85%
ater) covered the bottom in a layer exceeding
ee m in some places. It had been expected that
e Alewife system would be the less stable of the
o, because urban development has destroyed or
nctionally separated 50% of its former water-
urses and inland wetlands and 40% and 75% of
estuarine basins and marshes. It now appears
at both estuaries have exceeded critical
lances, which may be a characteristic of small
tuaries. The Alewife system however, appears
have advanced further on the road to tidal
minance. Its lower reaches are filling rapidly
th marine sediments and its mixing zone may ac-
ally be on the decline. In Goshen Cove, salinity
ructure was very stable following rainstorms,
t the area of soft sediments was expanded
yond the observed limits of mixing. While this
as not anticipated, it appears to be due to
riodic closure of the outlet with Long Island
ound.

uring growth. Denser water from the shallows,
here the depth of this convective layer is limited
y the sea bed, flows down the slope to the layer
terface contour where the breaking waves in-
roduce turbulence, aiding mixing of the convect-
ng water into the lower layer. Away from the
oundaries, entrainment of salt from the lower to
he upper mixed layer is aided by the internal
aves on the interface. These two salt transports
downward at the boundaries, upward over the
asin) produce horizontal salinity gradients which
verall make water in the shallows less saline than
he surface layer of the basin. The energies availa-
le for these mixing processes were estimated.

Circulation, Coasts, Inlets(Waterways), Salinity,
Sediments, Deposition(Sediments), Erosion,
Scour, Currents(Water), Fathometers, Channels,
Well-mixed estuaries.

In well-mixed, high salinity estuaries of the
southeastern US, the net circulation is mirrored in
the bathymetry. Measurements in North Inlet,
South Carolina, indicated a net current reversal
across the estuary. The cross section bathymetry
is usually bimodal, with two channels separated by
a shallow area. The deeper channel experiences
ebb-directed net flow with ebb-oriented sand
waves as the predominant bedform. In the shal-
lower channel, the net current is flood-directed. In
well-mixed estuaries similar to North Inlet, it may
be possible to determine qualitative circulation
features from a few lateral and longitudinal
bathymetric traces without measurements of cur-
rent velocity and salinity. (Sims-ISWS)

*Volume, *Chesapeake Bay, Sampling, On-site
data collections, On-site investigations, Marine
biology, Plankton, Diatoms, Nannoplankton,
Plankton nets, Data processing, Bays, Estuaries.

Relative numbers and sizes of detritus vs
phytoplankton particles were determined by visual
counting over a period of 17 months at a mid-bay
station in a temperate estuary. Detritus averaged
76.6% of total particle numbers, the phytoplankton
23.4%. Seasonal variation in detritus numbers was
minimal as compared to the strong summer pulse
of the phytoplankton. Detritus numbers were con-
centrated in the smallest size category (64.7% at 2-
5 micrometer) as were the phytoplankton (55.6% at
2.5 micrometer). Detritus particles also
overshadow the phytoplankton in total volume
present, representing 65.7% of total yearly
volume, the remaining 34.3% of total volume
representing live cells. The peak of detritus
volume determined by visual counts is at the high
end (20-35 micrometer), whereas phytoplankton
volume peaks at mid ranges (5-20 micrometer).
Phytoplankton occurrence and abundance, and the
percent of phytoplankton volume contributed by
each taxonomic class, are also recorded. (Sims-

water, Saline water, Saline water-freshwater inter-
faces, Stratification, Oceans, Oceanography,
Two-layer systems.

A frictionless, nonlinear model with allowance for
motions which are far from a state of geostrophic
balance was considered in order to describe the
dynamics of outflows consisting of two layers of
fluids. The governing equations were solved by
means of perturbation expansions, conformal
mapping, and Fourier series. The theory was com-
pared with laboratory experiments. The model
predicted that an outflow from a channel with
uniform velocity distribution deflects to the right
in the Northern Hemisphere. The parameters of
the problem were combined in such a way as to
show that rotational effects are important when-
ever the ratio between the internal Froude number
to the Rossby number is not negligible; the inverse
of this ratio has a 'critical' value, below which the
flow separates from the left basin bank. The
mathematical analysis showed that an outflow
from a channel with initial negative relative vor-
ticity approximately equal to the Coriolis parame-
ter deflects to the left. As in the uniform flow case,
the flow separates from one of the banks under
certain 'critical' conditions. Two experimental
systems which included an abrupt cross sectional
variation in a rotating channel consisting of two
layers were used. The experimental results com-
pared favorably with the direction of deflection
predicted by the mathematical model. Possible ap-
plication of this study to the Straits of Gibraltar
and other outflows were discussed. (Sims-ISWS)

3A. Saline Water Conversion

VAPOR COMPRESSION ENERGY REDUCTION BY VERTICAL TUBE FOAM EVAPORATION OF SEAWATER,
California Univ., Berkeley. Sea Water Conversion
Lab.
H. H. Sephton.
In: Proceedings 6th International Symposium
Fresh Water from the Sea, Vol. 2, p. 141-146,
1978.(California Water Resources Center
Desalination Project).

Descriptors: *Vapor compression distillation,
*Desalination, *Desalination plants, Evaporators,
*Distillation, Vertical tube foam evaporation
method, Energy, Sea water, Heat transfer.

Presented are experimental data obtained with a
new vapor compression-driven vertical tube
evaporation pilot plant having a capacity of 20 cu.
meter per day of desalted seawater. Significant
reductions in energy consumption are achievable
for both the upflow and downflow modes of verti-
cal tube evaporation with the vapor compression
technique, by imposing foamy two-phase vapor-
liquid flow over the heat transfer surfaces. This
vertical tube foam evaporation method was shown
to provide heat transfer performance enhance-
ments of 38 and 75 percent for the downflow and
upflow modes respectively, and corresponding
vapor compression energy savings of 14 and 35
percent.

*Demineralization, *Water treatment, *Water pu-
rification, Resins, Ion exchange, *Hybrid resins,
Regeneration.

A commercially economical desalination process
employes thermally regenerable resins. The
process utilizes hybrid resins which constitute a
system made up of discrete weak acid and weak
base resin particles. The hybrid resins are
prepared by filling a macroreticular copolymer,
usually termed 'host copolymer' with a cross-

linked copolymer of a different nature termed a 'guest copolymer'. This process results in the location of one type of polymer in the pores and another type of polymer in the framework of the hybrid intermediate polymer. The process includes regenerating the hybrid ion exchange resins by elution with an aqueous liquid having a temperature greater than that of the liquid at the time of the absorption phase. REJECT STREAM REPLACEMENT STUDY.
Bureau of Reclamation, Denver, CO. Lower Colorado Region.
Status report, January 1978. 112 p, 12 fig, 2 tab, 21 ref.

Descriptors: *Desalination, *Reclaimed water, *Mexican Water Treaty, *Colorado River basin, *Water reuse, Canal lining, Ground water mining, Water quality standards, Water resources, Mexico, Gila Project, Saline soils, Desalination plants, International waters, All-American Canal, Salinity, Water quality, Water demand, Pumping, Saline water.

As a result of decreased natural runoff and increased amounts of saline ground water derived from the Gila Project, the salinity of the Colorado River water reaching the Mexican border increased to 1500 p/m in 1962. To comply with the Mexican Water Treaty standard of 800 p/m, the Bureau of Reclamation was authorized to build a desalination plant near Yuma, Arizona, capable of producing 97,000 acre feet of water. However, the highly saline reject stream from this plant would substract 42,000 acre feet of water which must somehow be replaced to supply the amount of water promised to Mexico. Rather than further diminish already minimal water supplies in the Southwest, Congress authorized a study to identify feasible methods to replace the reject stream water. The findings of an interdisciplinary team which examined 11 possible methods from the standpoint of technical, economic, social/environmental, and institutional considerations are summarized. Of these 11 methods, 7 are considered feasible alternatives and will be studied further. These are: lining a reach of the All-American Canal to salvage seepage; desalting sea water from the Pacific near Los Angeles; adding a desalting plant in the Imperial Valley, California; extracting geothermal fluid from the ground and desalting it using heat and pressure of the fluid itself for power; extracting ground water near the U.S. Army Proving Ground near Yuma; pumping ground water seepage flowing southward from the All-American Canal; increasing recovery rate of the Yuma plant from 70% to 90%. Full descriptions of these alternatives as well as the four rejected plans are supplied, including maps, site plans, potential yields, and cost rates. Advantages and disadvantages of each are discussed and compared. (Majtenyi-IPA)

LABORATORY STUDIES ON ADVANCED COMPOSITE H F MODULES FOR SEAWATER REVERSE OSMOSIS,
Albany International Co., Dedham, MA. FRL Div.
M. J. Coplan, R. B. Davis, and J. H. Beale.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 990, Price codes: A06 in paper copy, A01 in microfiche. Report OWRT/S--78/14, (1978). 113 p, 21 tab, 46 fig, 13 ref. OWRT S-0089(No. 7508)(1).

Descriptors: *Desalination, *Membrane processes, *Reverse osmosis, Sea water, Brackish water, Membranes, Hollow fiber membrane module, *Composite membranes.

Work conducted under this contract is for the development of a reverse osmosis hollow fiber composite membrane targeted for single-pass seawater desalination. This membrane is comprised of a furan-based rejecting barrier deposited on and near the surface of a microporous polysulfone hollow fiber of dimensions typically 25Ou O. D. and 75u I. D. These dimensions are variable within limits and can be tailored to an application. Porous polysulfone fiber substrate is prepared by a regulated dry jet/wet spinning process. A typical batch preparation will convert a pound of commercial (Union Carbide) polysulfone into approximately 5,000 linear feet of 6-filament continuous yarn spun from a dimethylformamide base spin dope. The rejection barrier is a cross-linked furan resin formed in situ. It is negatively charged due to the existence of numerous sulfonate groups bound to the resin during polymerization, a condition expected to impact fouling resistance. The composite membrane system generally resembles the so-called 'NS-200' type, but significant changes in both form and chemistry have resulted from work carried out independently by the Contractor. Geometry of the fiber bundle and of the module have received much attention. The mechanics of winding and the resulting cross-wound configuration have been designed to minimize channeling and concentration polarization effects. A novel potting and fiber opening process have been perfected.

Descriptors: *Desalination, Scaling, *Desalination processes, *Membrane processes, Reverse osmosis, *Brackish water, *Pilot plants, *Ion exchange, New Mexico, Gypsum scale, Crystal growth, Water treatment, Roswell(NM).

Pilot plant test result are discussed in which 67% increased water recovery was obtained from simulated RO concentrate of high calcium-high sulfate water similar to projected Yuma Desalination Facility reject operated at 70% recovery; i.e. an overall recovery of 90%. The self-sustaining system consisted of ion exchange softening of interstage concentrate using as regenerant salt, only the final reject from Secondary RO and no imported salt. No antiscalant was used for protection of either the IX or RO systems. The level of regeneration was enhanced by reuse of previously used regenerant, desupersaturated with respect to gypsum by a fluidized seed bed crystallizer, a Spiractor. Capital and annual costs are projected. Two RO systems were employed for desalination of the softened concentrate -(a) dupont 4 inch B-10 Polyamide Seawater Hollow Fiber System consisting of three permeators in 2:1 array producing 5400 gpd product water and (b) Envirogenics 498-40 Spiral Wound Cellulose Acetate Blend elements consisting of three two-element vessels in 2:1 array and operated in a partial recycle mode producing 4500 gpd product water. The test work was performed at Roswell Test Facility on chemically 'doctored' blended city and brackish well water over an operating period of 1100 hours and 441 ion exchange cycle, during which the Spiractor removed 2650 lbs. of granular gypsum.

branes, Plugging Index, Dechlorination, Foulin
control, Wrightsville Beach(NC), North Carolina.

Three seawater pretreatment systems, thre
reverse osmosis (RO) membranes and two elec
trodialysis pilot plants were tested at OWRT'
Wrightsville Beach Test Facility between Jul
1975 and August 1976. Pretreatment testing ha
shown that a minimum of 25 mg alum per liter o
seawater was required to obtain settleable flocs i
clarifiers followed by a dual-media and polishin
filtration to obtain 5 minute-and 15 minute
plugging indices less than 30 and 50 respectively
considered by RO manufacturers as indicative o
acceptable feed water quality. Testing of in-lin
coagulation followed by dual-media and polishin
filration indicated an effluent with a 15 minute
plugging index less than 60 and often less than 5
may be obtained with use of only 10 mg/l alum. I
was also found that the use of garnet media in fil
ters greatly improved filtrate quality. The use o
clarifiers provides a consistent prefilt quality o
seawater supply to the filters and smooths out in
fluent quality fluctuations. However, in-lin
coagulation is economically very attractive and it
optimization should provide acceptable feed quali
ty at considerably less cost than the present esti
mates published in literature.

North Carolina, Desalination processes, Cost esti
mate, Wrightsville Beach(NC), Gasket Separators

The overall objective of this program is the development of reliable, improved electrodialysis technology for sea water desalination. The principal improvements are use of thinner components than are currently employed in commercial apparatus and operation at higher than ambient temperature. On the previous phase of Contract No. 14-30-3084, two test stacks and a test rig of flexible application were constructed and shop tested. The present phase of the work has been dedicated to field testing the stacks at the Wrightsville Beach Test Facility. The test rig was designed to contain only one electrodialysis stage. With a single stage, batch operations is required to produce a product of acceptable salinity. To interpret the data from the batch runs, a computer model of the unit was developed. This model was used to simulate the performance under a wide variety of conditions. These simulations with appropriate economic factors were used to calculate the cost of desalting sea water under specified conditions. Under reasonable conditions, the cost of product water ranged from 0.26 to 0.46 $ per cubic meter ($1.00 to $1.75 per thousand gallons). The increase in price over previous estimates is due partly to more accurate knowledge of the system but primarily to increase costs of power and increased costs of components. study included a laboratory phase and a field- phase. In the laboratory phase using either a hetic water or Wellton-Mohawk canal water, es were deposited on cellulose acetate RO nbranes. Cleaning tests were performed with ous chemicals and combinations of chemicals. gypsum scales, a combination of EDTA, am- ium bicarbonate and a fluorocarbon surfac- was found to be more effective than EDTA e, or any other forumlation tested. Ammoni- bifluoride was found to be best for SiO2 es, whereas sodium hydrosulfite was best for -containing scales. Experiments were also run the effectiveness of several commercially ilable scale inhibitors for the inhibition of calci- carbonate and gypsum scales. These results wed that products' marketed by Monsanto and uaness were most effective for the inhibition of cite and gypsum, respectively. The field-test tion of the program showed that the predomi- t scale deposit obtained was a clay-like materi- composed of Si, Al, Ca, Mg and Fe. These osits are extremely difficult to remove and e only partially removed by some of the better forming cleaners tested in the laboratory.

e water required to irrigate greenbelts being tablished around cities in Iran is a major cause concern in a country with insufficient supplies. ethods of afforestation which do not require ir- ation must be found. One such method is to con- ntrate water, received by a watershed without getation, for distribution over a smaller area here plants are growing by making portions of e watershed area impervious to water through plication of asphalt. This principle was tested on noff plots 2 m wide and 10 m long. Runoff from ch plot was measured to study its variations as a nction of age of asphalt cover and rainfall nount and intensity. The concept was further sted by constructing 2-m wide terraces along ntour lines at 5-m intervals on a hillside with a pe of about 30%. Tree species, ecologically apted to the area, were planted on the terraces. alibrated gypsum blocks were placed at depths of , 30, 45, and 60 cm in the terraces and at depths 10 and 30 cm in the watershed area between the rraces to measure soil water potentials. As the asphalt membrane aged, its efficiency in inducing runoff decreased. The runoff efficiency was nearly 75% initially, but decreased to 25% after 4 years. A regression equation was obtained correlating the runoff efficiency with age of the asphalt membrane. Freezing and thawing of the soil, growth of plants, and shrinking and swelling of clays resulted in the deterioration of the membrane. It remained effective for about 5 years. Alternative methods of afforestation which do not require irrigation must be developed for arid regions. One such method is to concentrate water received by a watershed without vegetation on a smaller area where trees are planted. This can be done by making portions of the surface of a watershed impervious to water through application of asphalt. This principle was tested near Tehran, Iran, by constraining 2-m wide terraces on contour lines at 5-m intervals resulting in a watershed to spreading area ratio of 1.5. Asphalt was sprayed at the rate of 1 liter/sq m in December 1969. Seedlings of Robinia pseudacacia L., Cupressus arizonica G., and Fraxinus rotundifolia Mill., tree species commonly used in irrigated afforestation projects in Iran, were planted in March 1970 on the terraces. Runoff from asphalt-treated areas did not significantly increase the survival of the tree seedlings. The 23.4 mm of rain in July 1970, completely overwhelmed treatment effects. This rain was a rare event for the Tehran area. The increases in growth of height, crown cover, and stem cross section due to the asphalt treatment at the end of a 5-year period were 61.5, 60.9, and 53.0%, respectively, for Robinia pseudacacia L.; 14.6, 15.4, and 31.6%, respectively, for Cupressus arizonica G.; and 29.4, 79.6, and 23.9%, respectively, for Fraxinus rotundifolia Mill. 3C. Use Of Water Of Impaired Quality

PRELIMINARY IDENTIFICATION OF THE SALT PICK-UP AND TRANSPORT PROCESSES IN THE PRICE RIVER BASIN, UTAH,
Utah Water Research Lab., Logan.
J. P. Riley, D. S. Bowles, D. G. Chadwick, and W. J. Grenney.
Paper presented at the Third International Hydrology Symposium, Fort Collins, Colo. February 1977, 15 p. OWRT-A-039-UTAH(1), 14-34-0001-7094.

Descriptors: Transport depletion, Saline water, *Salinity, *Utah, Salt transport(Rivers), *Price River(Utah).

The Price River is a significant contributor of salt to the Colorado River. Relatively pristine waters leaving the upper elevations of the basin degenerate into highly saline waters entering the Green River. The primary reason for this deterioration is the contact of the river with the Mancos shale, a marine shale, which underlies most of the central basin. The structure of an evolving model of the salt pick-up and transport processes in the Price River Basin is presented. The initial purpose of the model is to aid in the identification of the natural and man-modified hydro-salinity-sediment system of the basin. This identification procedure will result in both a better qualitative understanding of the important physiochemical processes, and in a mathematically precise description of these processes. When the identification stage is complete, the model will be used as a management tool for such purposes as examining various strategies for reducing salt loads in the Price River and in other similar rivers.

The feasibility of using various water conservation measures to reduce residential water demand was examined. Ten conservation techniques were found to be relevant. These included meters, recycle systems, devices, pressure and flow reducers, public education, restrictions, building and plumbing codes, horticultural changes and pricing. Each measure was evaluated and various combinations were assessed to develop viable alternative options. Costs and benefits were also evaluated. Water savings of 30 to 40% were possible through imposition of programs of water conservation. A case example of application of such a program for Lyons, Colorado is included.

TEXTILE WASTE WATERS: TREATMENT AND ENVIRONMENTAL EFFECTS,
Water Pollution Research Lab., Stevenage (England).
D. K. Gardiner, and B. J. Borne.
Journal of the Society of Dyers and Colourists, Vol. 94, No. 8, p 339-348, August, 1978. 2 fig, 3 tab, 33 ref.

Descriptors: *Textiles, *Dyes, *Bleaching wastes, *Water reuse, *Reclamation, Water pollution sources, Chemical wastes, Organic wastes, Biological treatment, Inorganic compounds, Centrifugation, Activated carbon, Coagulation, Flocculation, Flotation, Dialysis, Adsorption, Tertiary treatment, Oxidation, Membrane processes, Filtration, Separation techniques, Color, Sludge disposal, Treatment facilities, Waste water treatment, Industrial wastes.

The characteristics, treatment, and impact of textile processing effluents are reviewed. Average effluent volumes of 0.18 cu m/kg of cotton or manmade fiber and 416 cu m/day from wool processing are produced; mixed textile wastes contain 264-3070 mg BOD/liter. Final mercerizing, bleaching, and dyeing rinse waters may be sufficiently dilute for reuse; scouring liquors and combined process effluents are generally too highly contaminated for recycling. Secondary treatment of combined domestic wastes and pretreated mill effluent can provide the advantages of nutrient sources, dilution, more convenient sludge treatment, and better treatment supervision. Effluent pretreatment before discharge to a sewer system should include sulfate and hydrogen sulfide removal, volatile solvent removal, and fat and grease reduction. In-plant recovery and reuse can be accomplished by: caustic soda extraction by filtration-dialysis or centrifugation-evaporation; carboxymethylcellulose precipitation by calcium oxide or carbon dioxide; and azo dye stripping by centrifugation and solvent extraction. Dilute rinse waters may be reused after pH adjustment, primary coagulation and flocculation, biochemical or physical-adsorption treatment, or polishing. Color can be removed by: chemical coagulation and separation, bioadsorption and biochemical oxidation, activated carbon adsorption, chemical oxidation, and membrane filtration. Process chemicals, surfactants, foam, and grease can hinder biological treatment; textile sludges may contain high levels of organic compounds, heavy metals, and grease, making disposal or treatment difficult. (Lisk-FIRL)

WATER REUSE: A TRICKLE BECOMES A TORRENT,
J. C. Davis.
Chemical Engineering, Vol. 85, No. 10, p 44, 46, 48, April 24, 1978.

Descriptors: *Water reuse, *Pulp and paper industry, Water conservation, Water pollution sources, Recycling, Chemical industry, Freshwater, Oil industry, Industrial water, Water requirements.

Water reuse practices in the chemical process industries (CPI) are changing. Most companies throughout the U.S.A. are recycling more water and consuming less fresh water, and this pattern is expected to hold through the end of the century. The chemical and allied products, petroleum refining, and pulp and paper spectors of the CPI consume nearly two-thrids (almost 100,000 millio gal/day) of industry requirements. Typica of wate recycling efforts, Scott Paper Co. at Fort Edward New York, has reduced the mill's fresh wate requirements from 10 million to 2.3 millio gal/day. (Witt-IPC)

HOW KIND TO THE RESOURCES IS TH GRINDING PROCESS. (HVOR RESSURSVENN LIG ER SLIPEPROSESSEN),
Norwegian Pulp and Paper Research Inst., Oslo.
J. A. Oksum.
Norsk Skogindustri, Vol. 32, No. 2, p 37-40 February, 1978. 9 fig, 2 ref.

Descriptors: *Water conservation, *Groundwoo mills, Foreign countries, Europe, Energy, Conser vation, Water consumption, Organic matter, Pul and paper industry, Water pollution sources Water pollution control, Water quality control Heat exchangers, Water cooling, Freshwater Temperature, Norway, White water(Pape machines).

A resource utilization study conducted by the Nor wegian Pulp and Paper Research Institute aimed a helping market groundwood mills to improve thei fiber, water, and energy conservation. The im portance of water consumption to losses of soli and dissolved organic matter is pointed out Material balances are calculated and used t prepare energy balances which, in turn, made i possible to estimate the importance of hea exchangers in the white-water circuit. Mills whic cannot cool water with heat exchangers must con sume considerable volumes of freshwater to main tain a satisfactory system temperature. Assumin a constant quality of incoming wood supply, th dissolution of organic matter at constant tempera ture is totally dependent on the energy inpu (measured as pulp freeness). Whether this dis solved material leaves the mill within the produc or with the effluent is governed by the specifi water consumption (per ton of groundwood pulp) Obviously, lowering the freshwater intake will in crease the mill's productivity. (Brown-IPC)

STEAM STRIPPING REDUCES CONDENSATI AT WEYCO MILL,
Weyerhaeuser Co., Springfield, OR.
J. W. Grant.
Paper Trade Journal, Vol. 162, No. 9, p 47, Ma 15, 1978.

Descriptors: *Pulp wastes, *Waste water treat ment, *Condensates, *Steam, Effluents, Pulp an paper industry, Wastes, Industrial wastes, Wast treatment, Biochemical oxygen demand, Oregon Costs, Aerated lagoons, Water pollution treat ment, Water pollution sources, Evaporators Board mills, Kraft mills, Air pollution.

Steam stripping of high-BOD condensate stream from the batch digester blow and relief system, th Kamyr continuous digester flask tank, and th multiple-effect evaporators is practiced at th kraft linerboard mill of Weyerhaeuser Co. i Springfield, Oregon. Vapor recompression pre evaporation ensures the capture of 80% of th BOD, largely in the form of combustible methanol Cost savings resulting from a decrease in BOD discharged to the aeration basin are considerable (Swichtenberg-IPC)

E CLOSED MILL CONCEPT,
ernational Paper Co., Mobile, AL.
W. Bush.
PPI Papermakers Conference, Atlanta, Geor- , April 10-12, 1978. Preprinted Proceedings APPI, Attlanta, Geogia), p 121-124. 13 ref.

scriptors: *Pulp and paper industry, *Water nservation, *Water reuse, Water pollution con- l, Wastes, Industrial wastes, Water pollution rces, Recycling, Legislation, Industrial water, lp wastes, Costs, Economics, Closed systems.

implement a closed mill system, effluent water ich has been sufficiently purified to be suitable dilution or cleaning purposes must be parated from the high-solids concentrate, and rage must be available to accommodate all in- nal fluids from the mill. Advantages of a closed stem include significantly decreased expenses providing and preparing fresh water, decreased atment needs before the release of final ef- ent, and improved public image. Disadvantages lude reduced production (caused by require- nts such as increased addition of retention ls), increased corrosion (caused by increase of solved salts), and other potential problems, ch as excessive temperature build-up, unac- ptable, bacterial growth, product mottle, color riations, pH control, slime, foam, pitch, and felt d wire plugging. There is also a strong phychological resistance to the closed mill system. Examples of closures at 3 mills are discussed. One of the major complaints against the closed mill concept involves federal regulations: because of time limitations, imposed expenditures are mandated, and the rate of spending is uncontrolled. ANGULARITY SENSOR MEANS FOR CENTER PIVOT IRRIGATION SYSTEM,
Toro Co., San Marcos, CA. (Assignee).
E. J. Hunter.
U.S. Patent No. 4,085,771, 7 p, 7 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 969, No 4, p 1306, April 25, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation efficiency, Application equipment, Lateral conveyance structures, Water delivery, Sensors.

A center pivot irrigation system has propelled articulated span units mounting interconnected sections of water carrying conduit. Each span unit has a motor and a motor control for regulating the operation of the system to maintain the span units in a pre-determined relative alignment in a vertical plane revolving about a vertical line at the center pivot of the system. The control has an angularity sensor which is connected between span units for sensing in a substantially horizontal plane changes in angularity between the span units relative to the desired revolving vertical plane. (Sinha-OEIS)
W79-00023

FLOW REDUCING DEVICES PARTICULARLY USEFUL AS DRIP EMITTERS FOR DRIP IRRIGATION,
M. Drori.
U.S. Patent No. 4,084,749, 7 p, 7 fig, 9 ref; Official Gazette of the United States Patent Office, Vol. 969, No. 3, p 962, April 18, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation practices, *Irrigation efficiency, *Flow control, Application equipment, Water delivery, Drip irrigation.

Flow-reducing devices particularly useful as drip emitters comprise a housing having a closure cap snap-fitted and enclosing a flow-retarding member formed with recesses on opposite faces. Each recess is bridged by a pair of holes to provide a serial path for the flow of the water through the holes from one face to the opposite face. Also described is the use of a regulator including a valve member sensing the fluid pressure at the inlet of the device to produce a substantially uniform output of water despite variations in the line pressure at the inlet. (Sinha-OEIS)

TWO-STEP ROLL AHEAD IRRIGATION SYSTEM,
R. D. Boone, and C. Griffin.
U.S. Patent No. 4,084,610, 8 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol. 969, No. 3, p 912, April 18, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation efficiency, Application equipment, Operation and maintenance.

An irrigation system is moved with an oscillating trojan bar operating against a lugged wheel. A drive pawl on the trojan bar drives the wheel forward on level ground or uphill. A hold-back pawl on the trojan bar keeps the wheel from running free when going downhill. The detent likewise contains an uphill pawl and a downhill pawl. (Sinha-OEIS)
W79-00032

DRIP IRRIGATION SYSTEM,
Du Pont de Nemours (E. I.) and Co. Wilmington, DE. (Assignee).
R. B. Duggins.
U.S. Patent No. 4,086,774, 4 p, 3 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 970, No 1, p 42, May 2, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation efficiency, *Flow control, Water delivery, Application equipment, *Drip irrigation.

A drip irrigation system is disclosed in which individual drip irrigation tubes are fed from a header by means of a flow controller which feeds water to the irrigation tube at an essentially uniform rate over a wide variety of pressures in the header. Generally the flow controller will be capable of maintaining the flow within + or - 15% of a predetermined value within a pressure variation of from 3 to 60 psi. The flow controller is a housing containing a deformable member which deforms increasingly in response to water pressure. The more the deformable member deforms the smaller the effective opening controlling the water flow becomes so that the gallons per minute of water received by the drip irrigation tube remans relatively constant. (Sinha-OEIS)
W79-00038

ABOVEGROUND SPRINKLING DEVICE FOR SPRINKLING SYSTEM,
V. J. Traina.
U.S. Patent No. 4,087,-49, 6 p, 9 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 970, No 1, p 137, May 2, 1978.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation systems, Irrigation efficiency, Application equipment, Water delivery.

An aboveground sprinkling device has a sprinkler head at the center of its upper surface and has four sockets spaced at ninety-degree intervals around its side edge, all leading in to a central chamber immediately below the sprinkler head. An integral holding spike extends down from the bottom of the sprinkler head, preferably at the center, for holding the sprinkling device in a selected location. The spike is shaped to resist rotation. A set of plugs is provided to close the sockets that are not to be used. A hose or hoses can be secured to any one of the sockets or to several of them or to all of them to incorporate the device in a continuous sprinkler system employing a number of these sprinkling devices. The sockets not connected to hoses are plugged. (Sinha-OEIS)

EFFICIENCY OF SCREENLESS WELLS FOR IRRIGATION,
Ministry of Reclamation and Water Management, Moscow (USSR).
Y. Bogomolov, R. Stankevich, and N. Lapshin.
ICID Bulletin, Vol. 27, No. 2, July, 1978, p 77-80. 5 ref.

Descriptors: *Wells, *Well screens, Aquicludes, Aquifer testing, Aquifer characteristics, Exploration, Well construction, Intakes.

Problem related to the construction and use of screenless wells in artesian sand aquifers are discussed. There is more water intake surface and less hydraulic resistance in a screenless well which ensures high, steady yields for irrigation, water supply and dewatering. The major requirement for screenless wells is the availability of a steady upper confining bed overlying a sand aquifer. The confining bed must be fully penetrated by casing. The use of screenless wells in aquifer testing provides more accurate information on the hydrogeologic parameters of aquifers. The use of small-diameter screenless wells in aquifers previously regarded as non-productive has facilitated development of large scale water supplies. Screenless wells reduce the costs of ground-water exploration and management well construction and operation of water intake structures. Further research and development of screenless wells will contribute significantly to well drilling technology. (Purdin-NWWA)

WATER AND LAND RESOURCE ACCOMPLISHMENTS 1975. SUMMARY REPORT.
Bureau of Reclamation, Washington, DC. Economics and Program Analysis Branch.
Federal Reclamation Projects, 57 p, 7 tab. One of 4 volumes. (1976).

Descriptors: *Land reclamation, *Irrigation programs, *Crop response, *Irrigable land, *Flood control, Irrigation operation and maintenance, Recreation, Use rates, Hydroelectric power, Crop yield, Water supply, Agriculture, *Soldier Creek Dam(UT), *Western United States, *Environmental enhancement, Research and development, Irrigation management service, Youth conservation corps, Nonagricultural lands.

This volume is the annual report of the Bureau of Reclamation water and land resource accomplishments for 1975. These accomplishments are in the areas of irrigation; development of municipal, industrial and other nonagricultural water supplies; recreation; flood control; and power. Summaries of planning construction and research activities are also provided, as well as environmental enhancement activities, youth conservation programs and foreign activities. The report investigates these areas in detail and furnishes data on subjects such as acreage, yield, production, extension of irrigation to new lands, gross value of crops grown on all Reclamation projects, populations served by projects and other subsections of the areas. The focus is from a national viewpoint looking at the western half of the United States. Accomplishments by Reclamation project operations in 1975 were achieved through facilities consisting of 326 storage reservoirs, 355 diversion dams, 14,320 miles of canals, 900 miles of pipeline, 230 miles of project drains, 142 pumping plants, 50 power plants, and 16,250 circuit miles of transmission lines. These facilities include those constructed by others and in operation on Reclamation projects. These project facilities are usually constructed by the Bureau of Reclamation, but the operation and maintenance of the facilities is turned over to local water users as they become capable of administering them. Three appendices provide statistical summaries for Reclamation project data. (See W79-00192 thru W79-00194) (Coan-NC)
W79-00191

WATER AND LAND RESOURCE ACCOMPLISHMENTS 1975, STATISTICAL APPENDIX I.
Bureau of Reclamation, Washington, DC. Economics and Program Analysis Branch.
Federal Reclamation Projects, 284 p, Appendix 1 of 3 plus Summary Volume (1976).

Descriptors: *Cultivated lands, *Crop value, *Productivity, *Recreation usage, *Water distribution, *Land reclamation, *Irrigation programs, Water resources, Land resources, Agriculture, Regional analysis, Pacific Northwest Region, Mid-Pacific Region, Lower Colorado Region, Upper Colorado Region, Southwest Region, Upper Missouri Region, Lower Missouri Region, Acquired lands, Withdrawn lands, Easement lands, Western United States.

This volume is one of 3 statistical appendices to the 70th annual report on water and land resource accomplishments of the Bureau of Reclamation. It contains administrative information for use by the Bureau and others wishing detailed information on specific Reclamation projects. It includes regional and project data on acreage, yield, production, and gross value of crops grown; land utilization; water distribution; status of Reclamation lands, and other related topics. Regional summaries are provided for seven major regions of the United States--Pacific Northwest, Mid-Pacific, Lower Colorado, Upper Colorado, Southwest, Upper Missouri, and Lower Missouri regions. Detailed project data are presented. This statistical appendix provides information useful to analysts preparing economic and financial studies of Reclamation projects. The appendix has also been used in the settlement of disputes arising out of conflicts over water charges and allowances, crop damage claims, operation and maintenance charges, and adjustment to repayment contracts. This statistical series is intended to be an annual project so that minute historical investigations may be accomplished. (See also W79-00191) (Coan-NC)
W79-00192

WATER AND LAND RESOURCE ACCOMPLISHMENTS 1975, STATISTICAL APPENDIX II-FINANCES AND PHYSICAL FEATURES.
Bureau of Reclamation, Washington, DC. Economics and Program Analysis Branch.
Federal Reclamation Projects, 190 p, Glossary, Map, Appendix 2 of 3 plus Summary Volume (1976).

Descriptors: *Hydroelectric power, *Investment, *Repayment contracts, *Construction costs, *Irrigation programs, *Annual costs, *Cost repayment, Irrigation facilities, Debt, Cost allocations, Employment, Land resources, Water resources, Return(Monetary), *General Reclamation statistics, *Federal funds, *Nonagricultural lands, *Municipal water, *Industrial water, Annual appropriations, Irrigable acres, Western United States.

This volume is one of 3 statistical appendices to the 70th annual report on water and land resource accomplishments of the Bureau of Reclamation. These sets of summary tables provide extensive documentation of various aspects in Bureau Reclamation projects. The volume makes available annual tables of key financial and physical statistics. Included among the most important financial statistics are repayment of Reclamation Project construction costs and repayment of reimbursable costs, by repayment contracts and commercial power revenues, and statements of net i
come from various irrigation and electric pow
operations. Important physical data statistics a
storage and conveyance features in operatio
storage dams, dikes and reservoirs, diversio
dams, and carriage facilities for canals, pipelin
and tunnels. A major section deals with pow
plant and transmission line data giving their phys
cal features and generation and sale of energ
Another section of tables deals with the history
Congressional appropriation acts making fun
available for Reclamation projects. The sour
and disposition of the Reclamation Fund is brok
down by listing accretions, collections, reimburs
ments, and loans to the fund. The appendix also i
cludes a glossary of critical terms requiri
specific definitions for proper interpretation of t
Bureau's reports. (See also W79-00191) (Coa
NC)
W79-00193

EFFECT OF SOIL-INJECTED ETHYLENE O
SUGARBEET (BETA VULGARIS L.) YIEL
PARAMETERS,
Arizona Univ. Tucson. Dept. of Plant Sciences.
L. J. Francl, R. E. Dennis, D. K. Parsons, and A.
H. Froytag.
Journal of the American Association of Sugarbe
Technologists, Vol. 19, No. 4, p 331-336. 3 tab,
ref. OWRT A-034-ARIZ.(4), 14-31-0001-5003.

Descriptors: *Sugarbeets, *Ethylene, Sugar yiel
*Crop production, Arizona.

The first field experiment was located
southeastern Arizona in 1974. Ethylene gas was i
jected into a furrow 20 cm below the soil surfac
at a rate of 6.2 kg/ha. Each test plot consisted of

located 1, 5, 10, or 50 rows from the place of
lene injection. The rows were 76 cm apart.
ts in the first experiment were mechanically
ested, weighed, and sampled to determine the
r content. Sugar/ha was 16.5% higher in the
nearest the applied ethylene than in the row
ted 37.7 m from the place of application.
ough not statistically different, this finding
npted further field experiments. In March of
, field experiments in central Arizona were in-
ed. The methodology used for these experi-
ts closely followed that of the first field ex-
ment. There were no significant differences at
5% level among the ethylene treatments on
weight, sugar percentage, or sugar/ha in any
hese field tests because of high experimental
ability. The results in this study were variable
thus do not support the conclusion that soil in-
ions of ethylene can be used to increase yield
sugarbeets under the described conditions.
ther research should be directed toward find-
the optimum rate and date of ethylene applica-
, and optimum soil and environmental condi-
s.

CONTROL OF FURROW INFILTRATION BY COMPACTION,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
M. Khalid, and J. L. Smith.
Transactions of the American Society of Agricultural Engineers, Vol. 21, No. 4, p 654-657, July-August 1978. 10 fig, 2 tab, 3 ref.

Descriptors: *Furrows, *Furrow irrigation, *Soil compaction, *Infiltration rates, Compaction, Compacted soils, Infiltration, Equipment, Mechanical equipment, On-site investigations, Irrigation, Mechanical engineering, Agricultural engineering, Agriculture, Soil compactors.

Sandy soils are difficult to irrigate by surface methods due to their high infiltration rates. Using an impact furrow compactor, the infiltration rate was reduced 40% at the first irrigation. A crust, formed on the soil after the first irrigation, controlled the infiltration rate on subsequent irrigations. The same size of compacted and noncompacted furrows required approximately the same power. (Sims-ISWS)

A field investigation of the steady-state thickness and extent of a withdrawal layer in a startified resevoir was reported. Existing theory indicated that, throughout the study period, the withdrawal layer was in a steady state in the regime governed by a balance between buoyancy and viscous forces. A natural salt tracer in the water enabled estimates of the mean withdrawal layer thickness over a 10-km (6.2-mile) length upstream from the snk for two different time periods. To achieve good agreement between theoretical predictions and field measurements, it was necessary to postulate transport coefficients of momentum approximately 10 times the molecular value. Comparisons with model simulations over the same time period suggested an effective average Prandtl number of 20 in the hypolimnion. (Humphreys-ISWS)

OVERGROWING OF THE KARA KUM CANAL AND SOME AFTEREFFECTS OF INTRODUCING THE WHITE AMUR INTO WATER BODIES, (IN RUSSIAN),
Akademiya Nauk Turkmenskoi SSR, Ashkhabad. Inst. Botaniki.
Sh. I. Kogan.
Gidrobiol Zh 10(2), p 110-115, 1974.

Descriptors: *Aquatic weed control, Aftereffects, Canals, *Ctenopharyngodon idella, *Kara-Kum Canal, *Microcystis aeruginosa, *Reservoirs, *White amur, USSR.

Because of the absence of submersed plants, the white amur (Ctenopharyngodon idella) is deprived of a food base in the Kara-Kum Canal (USSR) and it is assumed that its number in the canal in recent years is insignificant. The number of white amur in catches from the canal and water bodies connected with it is steadily declining. There are a number of reservoirs on the Kara-Kum canal and here the role of the white amur as a biomeliorator is apparent. The increase of the abundance and biomass of phytoplankton in 2 reservoirs occurred because of Microcystis aeruginosa, an undesirable organism. Apparently collector-drainage canals are the only type of water body in which the white amur can be used without restriction for weed control. Copyright 1977, Biological Abstracts, Inc.

Descriptors: *Water resources, *Projects, *Publications, *Abstracts, *Bibliographies, Groundwater, Surface waters, Water quality, Streamflow, Water supply, Water utilization, Water resources development, Reviews, *Florida, Southwest Florida.

This report summarizes the activities of the Southwest Florida Subdistrict of the U.S. Geological Survey, Water Resources Division for fiscal year 1977. The organization and mission of the subdistrict office are described. The cooperative program for fiscal year 1977 included 41 interpretive investigations. Abstracts of twenty reports released by the subdistrict during 1977 and an extensive bibliography of reports released from 1933 to 1977 are included. The hydrologic setting of southwest Florida is outlined followed by discussions of surface-water, ground-water, and quality-of-water conditions. Hydrologic conditions in southwest Florida in 1977 are shown by the presentation of hydrographs from selected surface-water, ground-water, and lake-stage data collection sites.

LAKE LEVEL CONTROL AND MANAGEMENT--A CASE STUDY,
Barr Engineering Co., Minneapolis, MN.
I. Yomtovian.
Water Resources Bulletin, Vol. 14, No. 5, p 1176-1186, October 1978. 3 fig, 2 tab, 4 ref.

Descriptors: *Water resources, *Alternative planning, *Flood control, *Lake management, Hydrology, Flood damage, Lake level, Exceedence probabilities, Decision making, Methodology, Cost-effectiveness, Chicago Chain of Lakes(Minn), Minnesota.

The frequent high water levels in the Chicago Chain of Lakes, located in east-central Minnesota, have caused extensive flood damages. Recent floods raised the concern of the local property owners, and they pressured the Chisago County Board of Managers to initiate a study of alternative lake control levels. A study was accomplished to identify potential flood control alternatives, screen out the most promising feasible alternatives, and recommend the most cost-effective

control measure. Several flood control alter-
es were considered--eight of them were
zed and evaluated in detail. A statistical
od was used to estimate the expected annual
damages under existing and future condi-

A series of polymeric preparations were used to artificially fortify sod-podzolic sandy loam on carbonate loam morraine and sandy soil of the Katinin oblast (Russian SFSR, USSR). The polymers increased water stability by 2-5 times. The polymers used were K-4, K-9, Hypan, polyacrylamide, polyvinyl alcohol, polyoxyethanol, water glass with acrylic acid, a copolymer from vinylpyrrolidone and acrylonitrile, a copolymer from vinylpyrrolidone, acrylic acid and carbamide, acrylic acid and ammonium carbonate and a preparation made of acrylic acid and vinylacetate.--Copyright 1978, Biological Abstracts, Inc.

OPERATING MODEL FOR THE GREEN RIVER BASIN RESERVOIR SYSTEM,
Purdue Univ., Lafayette, IN. School of Civil Engineering.
C. Rukvichai.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 119, Price codes: A12 in paper copy, A01 in microfiche. PhD Dissertation. 1977. 255 p, 58 fig, 21 tab, 72 ref, 9 append. OWRT A-026-IND(6), B-094-IND(1).

Descriptors: *Reservoir operation, *Reservoir management, Competing uses, Reservoir releases, Routing, Reservoir storage, Model studies, *Kentucky, *Green River Basin(KY).

This study was concerned with the operation of the four reservoirs of the Green River Basin in Kentucky. This reservoir system is regulated by the Corps of Engineers. The purpose was to gain some insight of the current practices in regulating the reservoir system and identify the systematic experimental determinants such that an algorithm could be developed. A longer range goal was to have the Corps adopt the system and then take up the question of an optimal operation. An operating model called GRBOPM was constructed using a daily simulation model which is in the form of a computer routine package. The model has three main components, namely the reservoir routing component, RESROUT; the stream flow routing component, GRBSYS; and the operating policy component, POLICY. The on-line use of GRBOPM was studied to assist in the regulation of the reservoir system in real time. Two simulation runs for the on-line use were performed in the 'forecasting mode' and in the 'analysis mode'. The results were compared with historical data. (Wiersma-Purdue)

CONTROL OF WATER RESIDENCE TIME IN SMALL RESERVOIRS,
Agricultural Research Service, Oxford, MS. Sedimentation Lab.
F. R. Schiebe, and F. E. Dendy.
Transactions of the American Society of Agricultural Engineers, Vol. 21, No. 4, p 666-670, July-August 1978. 8 fig, 1 tab, 6 ref.

Descriptors: *Reservoirs, *Suspended solids, *Reservoir operation, *Model studies, Laboratory tests, Hydraulic models, Dye releases, Inflow, Discharge(Water), Mixing, Water circulation, Analytical techniques, Sediments, Sediment Control, Lakes, Limnology, *Residence time, Small reservoirs.

A small laboratory reservoir was used to investigate the water residence time in various density stratification and selective withdrawal situations. Dyed reservoir water was diluted by clear, temperature-controlled, inflowing water. The experimental results were analyzed in terms of two simple analytical models. Conditions required for minimum and maximum mixing of the inflowing water, maximum storage of the inflowing water, and maximum bypass of the inflowing water were investigated. All four conditions were successfully produced in the experimental reservoir. The results indicated that natural stratification, along with a selective withdrawal system, can either maximize or minimize the water residence characteristics of an impoundment. Thus, time available for sediment settling can be changed by manipulating the location of the withdrawal structure in the reservoir. (Sims-ISWS)

Descriptors: *Linings, *Clays, *Gravels, *Aggregates, *Seepage control, Canal linings, Reservoirs, Canals, Hydraulic conductivity, Permeability, Soils, Sands, Seepage, Pores, Porosity, Particle size, Soil water, Soil water movement.

Earth linings are used frequently in reservoirs, canals, and other earth structures to control liquid movement for the purposes of pollution control, water conservation, and structural stability. Clays or chemicals often are added to linings to reduce the hydraulic conductivity of the native soil; however, both additives sometimes decrease in effectiveness with time. Under ordinary conditions, gravel is nearly inert and does not change properties with time. The hydraulic conductivity of permeable soil was reduced substantially by adding gravel that was at least 15 times larger than the particle size of the soil. The amount of clay required to control seepage was reduced by half by the addition of gravel. (Sims-ISWS)

ENERGY CONVERSION SYSTEM,
E. H. Schwartzman.
U.S. Patert No. 4,084,379, 15 p, 10 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 969, No 3, p 834-835, April 18, 1978.

Descriptors: *Patents, *Geothermal studies, *Thermal conductivity, *Heat transfer, Energy conversion, Energy transfer, Gases, Electrical power production, Working fluid.

The most abundant type of geothermal energy consists of a hot thermally heated fluid usually saturated with many dissolved solids such as silica, dissolved calcium, calcium oxide, carbonates, ad various other soluble salts, the most common being sodium chloride. A simple direct contact energy exchange is provided in such a manner as to prevent any of the liquids employed, which may contain solutes, from coming into contact with any surfaces of the components used in the system. A working fluid, which is immiscible in water and which has the desired thermodynamic properties, is used to absorb energy from the fluid source by direct heat transfer. This exchange of energy is accomplished by the complete vaporization of the working fluid and a small portion of the liquid fluid source. The composition of the produced vapor is controlled by the given temperature and pressure at which the process takes place and in turn is dependent on the thermodynamic properties of the working fluid employed and the flow rate of both the working fluid and the energy source fluid. The resulting vapor mixture is then utilized directly by expansion through a power producing device such as a turbine to produce power. (Sinha-OEIS)

PROCESS AND SYSTEM FOR RECOVERY OF ENERGY FROM GEOTHERMAL BRINES AND OTHER WATER CONTAINING SOURCES BY DIRECT CONTACT WITH A WORKING FLUID BELOW THE CRITICAL PRESSURE,
Occidental Petroleum Corp., Los Angeles, CA. (Assignee).
S. G. Woinsky.
U.S. Patent No. 4,089,175, 13 p, 6 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 970, No. 3, p 832, May 16, 1978.

Descriptors: *Patents, *Geothermal studies, *Heated water, *Heat transfer, Heat exchangers, Temperature, Pressure, Condensation, Brines, Electric power production, Thermal powerplants, Working fluid.

A process and system are described for recovering energy from geothermal brines and other water containing or hot water sources such as ground waters heated by solar energy or other means, the energy being recovered from the brine or hot water using a working fluid such as a hydrocarbon, e.g. n-butane. The working fluid is heated in a direct contact heat transfer column. The heated working fluid is passed through an expander to product work, which is used to generate electricity or drive equipment. The working fluid is then condensed in a cooler. Condensed working fluid, water and uncondensed gas are separated in an accumulator. The cool liquid working fluid is pumped from the accumulator to the heat transfer column to be heated and carried through the cycle repeatedly. Cooled brine or water which heated the working fluid exits from the bottom of the column which acts as a liquid-liquid separator to minimize entrainment of the working fluid. This cooled brine or water is mixed with water separated from the working fluid in the accumulator, and is flashed at a pressure lower than that in the accumulator to flash of entrained and dissolved working fluid. The flashed working fluid is then compressed and fed to the cooler at the discharge from the expander and is thus recovered. An important feature residues in operating the heat transfer column so that the top of the column is in the subcritical pressure region of the working fluid close to or approaching the apex of the saturated vapor curve on the Moller diagram for such fluid. (Sinha-OEIS)

ELECTRICAL-RESISTIVITY SURVEYS FOR GROUNDWATER IN THE DECCAN TRAP COUNTRY OF SANGLI DISTRICT MAHARASHTRA,
Geological Survey of India, Hyderabad.
R. N. Bose, and T. S. Ramakrishna.
Journal of Hydrology, Vol. 38, No. 3/4, p 209-22
August 1978. 7 fig, 4 ref.

Descriptors: *Groundwater, *Electrical co ductance, *Surveys, *Water wells, On-site i vestigations, Droughts, Foreign countries, Wat supply, Foreign research, Water yield, Well Shallow wells, Flow rates, Potable wate Hydrogeology, *India.

The results are presented of electrical-resistivit surveys carried out to guide the shallow tubewe drilling program aimed at alleviating the drinkin water scarcity in the drought-stricken villages parts of Sangli District, Maharashtra. The resul showed that a combination of resistivity soundin and profiling is more effective in tacklin problems for the location of wells in the Decca trap country. The indispensability of resistivit profiling for detecting a shallow source of groun water in fractured/fissured zones in basaltic trap was highlighted. (Sims-ISWS)

GROUND-WATER AVAILABILITY IN THE HITCHCOCK-RED WILLOW, FRENCHMAN VALLEY, AND MEEKER-DRIFTWOOD IRRIGATION DISTRICTS, SOUTHWEST NEBRASKA,
Geological Survey, Lincoln, NE. Water Resources Div.
E. G. Lappala, P. F. Hemphill, and R. E. Booker.
Open-file report 78-461, 1978. 49 p, 20 fig, 3 tab, 10 ref.

Descriptors: *Surface-groundwater relationships, *Groundwater availability, *Supplemental irrigation, *Computer models, *Nebraska, Aquifer characteristics, Surface waters, Water demand, Water supply, Hydrologic data, Aquifer management, *Ogallal Formation, *Southwest Nebraska, Frenchman Creek, Republican River.

Surface-water supplies are diminishing in the Hayes-Red Willow and Frenchman Irrigation Districts in soutwest Nebraska. Stream depletions due to ground-water withdrawals upstream from Enders Reservoir have resulted in a shortage of about 8,700 acre-feet per year. The availability of ground water in two surficial aquifers was examined as a possible supplemental supply. The most productive aquifer comprises alluvial deposits in the valleys of the Republican River and Frenchman Creek. The Ogallala Formation, which underlies the remainder of the area is a less productive aquifer except locally. Water levels have risen as much as 20 feet north of the Republican River and as much as 40 feet south of the river. Ground water inflow to the Republican River has increased about 3 percent. A digital model of the aquifer system was used to assess the potential for providing supplemental supplies from two well configurations and from existing irrigation wells. The first well configuration could sustain a maximum of 25 percent of the 1976 deficit with maximum stream depletions of 11 percent to Frenchman Creek and 60 percent to Blackwood Creek. The second well configuration could sustain 25 percent of the 1976 deficit with stream depeletions of less than 5 percent at the end of 19 years. Existing wells are adequate to irrigate district lands on which they are located for at least 19 years.

WATER-RESOURCES APPRAISAL OF THE WET MOUNTAIN VALLEY, IN PARTS OF CUSTER AND FREMONT COUNTIES, COLORADO,
Geological Survey, Denver, CO. Water Resources Div.
C. J. Londquist, and R. K. Livingston.
Water-Resources Investigations 78-1 (open-file report), February 1978. 56 p, 13 fig, 1 plate, 10 tab, 20 ref.

Descriptors: *Groundwater resources, *Surface waters, *Aquifer characteristics, *Hydrogeology, *Groundwater availability, Water yield, Irrigation, Water quality, Groundwater recharge, Surface-groundwater relationships, Reservoir storage, Water supply, *Colorado, Custer County, Fremont County.

The Wet Mountain Valley is an intermontane trough filled to a depth of at least 6,700 feet with unconsolidated deposits. Ground water occurs under both artesian and water-table conditions within the basin-fill aquifer and ground-water movement is toward Grape and Texas Creeks.

The depth to the water table is less than 10 feet in an area of about 40 square miles along the central part of the valley and is less than 100 feet in most of the remainder of the valley. Ground water stored in the upper 200 feet of saturated basin-fill sediments is estimated to total 1.5 million acre-feet. Yields greater than 50 gallons per minute generally can be expected from wells in the central part of the basin-fill aquifer, and yields less than 50 gallons per minute are generally reported from wells around the edge of the basin-fill aquifer. Yields of wells in the mountainous areas are generally less than 20 gallons per minute. Most streamflow occurs as a result of snowmelt runoff during June and July. The long-term annual runoff at seven stations ranges from an estimated 0.02 cubic foot per second per square mile to an estimated 1.17 cubic feet per second per square mile, generaly increasing with station altitude. Generalized annyal water budgets for two areas in the Wet Mountain Valley indicate that surface-water outflow is only 7 to 11 percent of the total water supply from precipitation and other sources. The remaining water is lost to the atmosphere by evapotranspiration. The quality of both the surface and ground water is generally within the recommended limits for drinking water set by the U.S. Public Health Service. (Woodard-USGS)

MANAGEMENT ASPECTS OF CYCLIC STORAGE OF WATER IN AQUIFER SYSTEMS,
California State Dept. of Water Resources, Sacramento. Div. of Planning.
H. W. Greydanus.
Water Resources Bulletin, Vol. 14, No. 2, p 477-480, April 1978.

Descriptors: *Aquifer systems, *Water management(Applied), *Water storage, Legal aspects, Water quality, Effects, Legislation, Environmental effects, Energy, Physical impacts, Existing rights, Equitable treatment, Cyclic storage.

Most of California's precipitation falls at the wrong place in the wrong season in relation to water needs. Redistribution and regulation are essential. Aquifer systems-groundwater basins--can provide a share of the future cyclic storage regulation. There are some differences in management concepts in using a full basin in comparison with a partially dewatered basin. Legal water quality, and physical impacts on aquifer systems, including subsidence, are concerns. Legal water quality, and physical impacts on aquifer systems, including subsidence, are concerns. Storage may be for the benefit of overlying water users or for distant areas. Extraction during periods of dryness or recharge methods will require careful planning. Existing rights and uses and equitable treatment of all parties must be assured. Financial compensation may be involved. Changes in methods of operation or degree of self-determination by affected waer agencies will require committed watermanship to resolve. Legislation or amendments to organic acts may be needed, but much can be accomplished within existing statutes. Environmental impacts which can be avoided by not using large surface storage sites are important. Energy for pumping will be a key consideration. About 40 percent of California is underlain by aquifer systems. This resource offers major potential in overcoming in maldistribution of natural water resources. (Bell-Cornell)

OUR RECLAMATION FUTURE: THE MISSING BET ON TREES,
Southern Illinois Univ. at Carbondale, IL. Dept. of Botany.
W. C. Ashby, C. Kolar, M. L. Guerke, C. F. Pursell, and J. Ashby.
Illinois Institute for Environmental Quality, Document No. 78/04, January 1978. 85 p, 68 fig, 7 tab, 80 ref. 80.057.

Descriptors: *Land reclamation, *Strip mining, *Forestry, *Forest management, *Illinois, *Reforestation, *Land management, Conservation, Soil erosion, Reclamation, Land use, Natural resources, Forests, Recreation, Hardwood, Wind erosion, Water erosion, Habitats, Wildlife conservation, Ecology, Environmental effects, Cultivation, Soil conservation, Erosion control, Legislation, Coniferous trees.

The use of tree planting in reclamation of surface-mined land in Illinois is examined. The history of reclamation in the State from the early tree planting in the 1920's to the present is traced. This is followed by a description of factors involved in growing trees on surface-mined land, including species performance and planting recommendations. Growth characteristics and performance records are discussed for a number of hardwood and conifer species. Consequences of forestation on the environment are extremely favorable. For example, trees act as filters to remove potentially toxic particles from the air, eliminate or reduce wind erosion and water erosion, and improve scenery. The recreational and educational uses of reclaimed surface-mined land are outlined and the predicted needs for recreational land is compared with the potential supply within Illinois. The social and economic effects of reclamation to forest land are discussed in general and also for some specific regions of the State, such as the Chicago area, Western Illinois, and Southern Illinois. A chapter on reclamation legislation and goals for the State is included. The Illinois reclamation laws effective from 1962 to 1975 are summarized. Also, included are a list of references, a reclamation directory giving names and addresses of State officials and reclamation managers, and a glossary of common and scientific names of plants mentioned in the report. Measurements of soil surface elevation on po derosa pine-bunch lands in central Colora showed that 35 years of grazing and winter loggi had not caused serious erosion. All measuremer indicated an aggradation of soil surface material relation to differences in ground cover, grazi and timber removal. Aggradation on ungraz areas exceeded aggradation on grazed or logg areas by less than 7 millimeters. All logging w done when the soil was dry or frozen. Rubber-tir equipment was used for skidding and decking. extensive permanent road system was not bu Instead, temporary roads with frequent log dec were used. Log butts were raised off the grou for skidding, and work was temporarily suspend whenever midwinter temperatures allowed the s surface to thaw. (Humphreys-ISWS)

Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-271 94 Price codes: A04 in paper copy, A01 in microfich Journal Article Number 8208, 1975. 63 p.

Descriptors: *Wetlands, *Highway effec *Forests, Highways, Road construction, Effec Ecological distribution, Drainage effects, Mar management, Water pollution sources, Chloride Michigan.

The most important ecological effect on highw construction is the change of natural soil draina conditions. Wetland sites are most affecte Highway facilities may either raise or lower t groundwater table depending on culvert a drainage design. The sites where deep road cuts fills were made experienced a change in wa table levels near the edges of the roadway and creased evapotranspiration rates at the expos woodlot edges. The extent and duration of the altered drainage regimes is unknown. It is possib that they are just temporary and may be correct with time by plant successions if adequate drai and channels have been provided. The vegetati species most sensitive to highway constructi were conifers on the wetland sites. The growth hardwood species on wetland or upland sites w either unaffected or significantly increased. Wa contamination from highway use occurs, b recovery is fairly rapid. Downstream recove usually occurs within 200 feet of the highway. terchanges constitute the greatest threat to wa quality, especially with respect to chloride conce

ration. This is apparently due to the drainage conveyance at these sites. (Steiner-Mass)

LAKE SUPERIOR REGULATION EFFECTS,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
F. H. Quinn.
Water Resources Bulletin, Vol. 14, No. 5, p 1129-1142, October 1978. 8 fig, 2 tab, 7 ref.

Descriptors: *Lake Superior, *Regulation, *Effects, *Great Lakes, *Mathematical models, Water resources development, Planning, Simulation analysis, Water levels, Outflow, Diversion, Equations, Systems analysis, Natural regime, Historical considerations, Hydrologic response.

The outflows of Lake Superior through the St. Marys River have been modified from natural conditions, initially by the construction of engineering works, such as bridges, and later by the construction of control works and the regulation of the lake. For all practical purposes, the period from 1860 to 1887 represents the natural river conditions. During the period 1888-1900, the regimen was modified by the construction of the International Railroad Bridge and the Chandler-Dunbar Power Canal. In 1901, construction began on the compensating works. Following the completion of the compensating works in August 1921, the Lake Superior outflows were regulated in accordance with the Orders of Approval, 26 and 27 May 1914. A hydrologic response model was developed to simulate the natural Lake Superior regime. The model was run for the 1860-1975 period to simulate natural Lake Superior levels and outflows. The simulated levels were compared with the recorded levels to determine the effect of regulation. It was found that regulation has resulted in a rise in Lake Superior water levels. The simulated natural outflows for the period from 1937 to 1975 were run through the Great Lakes hydrologic response model to analyze the regulation effects on Lakes Michigan-Huron, St. Clair, and Erie. The results show no long-term bias due to regulation. (Bell-Cornell)

CHANGES IN WATER REGIME OF BROWN FOREST SOILS OF THE GEORGIAN SSR UNDER THE EFFECT OF SILVICULTURAL PRACTICES, (IN RUSSIAN),
Tiflis Inst. of Forestry (USSR).
T. F. Urushadze, and D. V. Lomidze.
Pochvovedenie (6), p 55-62, 1977.

Descriptors: *Forest soils, Georgian SSR, USSR, *Lumbering, Clear-cutting, Soil physical properties, *Soil moisture, Seasons, Soil, Trees, Soil erosion, *Moisture deficit.

Soils in undisturbed forest plantations (Georgian SSR, USSR) are characterized by better water-physical roperties than soils on sites where logging took place. The loss of soil moisture begins in the 1st half of April; soil moisture accumulation, from the 2nd half of Nov. In summer, under high (tree) density areas, the formation of a thick dead horizon is observed, as compared to the low density sites. With increasing age and density of the tree stand, the loss of soil increases.--Copyright 1978, Biological Abstracts, Inc.

A MODEL FOR EVALUATING THE EFFECT OF LAND USES ON FLOOD FLOWS,
Virginia Polytechnic Institute and State University, Blacksburg, VA. Agricultural Engineering Department.
B. B. Ross, V. O. Shanholtz, D. N. Contractor, and J. C. Carr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 170, Price codes: A07 in paper copy, A01 in microfiche. Virginia Water Resources Research Center Bulletin 85, October 1978. 137 p, 39 fig, 27 tab, 31 ref. appendix from Center upon request. OWRT A-077-VA(2).

Descriptors: *Watershed model, *Land-use model, *Finite element model, Flood flow routing, *Model studies, Storm water, Surface flow modeling, Parametric model, Watershed subdivision.

A model was developed for predicting storm hydrographs by combining the components of a rainfall excess generator and a stormwater routing routine. The spatially responsive characteristics of this model structure were accomplished by assuming two basic discretization phases. The first phase focused on minimizing the aggregation of the dynamic, hydraulic storage properties in soils and surface conditions. Soils and land-use data defined 'homogeneous' response units; a parametric soil moisture algorithm generated rainfall excess for each unique response unit. Phase two considered the watershed's physiographical properties and developed a finite element structure to route rainfall excess downstream. The governing flow equations of continuity and momentum were solved by the finite element numerical technique. The finite element model structure can be used with input data at either a fine or coarse level of data resolution. Trade-offs exist among such factors as computer costs, data acquisition, and accuracy. Results from applying the model to several watersheds with complex land uses were encouraging. Comparisons with recorded discharge were made in the ungaged context; that is, the data base was created, streamflows were generated, and then were compared to recorded flows with no optimization. Several scenarios are included in the text, each illustrating the utility of the modeling concept for evaluating the impact of land-use alternatives on flood flows.

A MODEL FOR EVALUATING ALTERNATIVE LAND DEVELOPMENTS AROUND LAKES,
New Hampshire Univ., Durham.
J. A. Pickering.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 169, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, May 1978. 81 p, 5 fig, 10 tab, 30 ref, append. OWRT A-038-NH(1), 14-31-0001-4029.

Descriptors: *Economic impact, Hydrologic aspect, Water quality, Economic development, Watershed management, Lakes, Land use, Lake shore development, Water quality, Phosphorus accumulation, Economic-environmental trade-off, Mathematical programming.

Alternative development patterns, evaluated by their impacts on the lake area environment and area economy, included residential patterns, commercial patterns, and combinations of these two types. Economic impact from each alterative development was measured in terms of net public revenue and total private expenditures to the local area, to the state and to other states. The impact of the alternative developments on the lake area environment was measured in terms of crowding levels and the level of phosphorus concentration in the lake. Crowding levels included lake surface use, public beach use and the total number of user days spent in the area. Phosphorus loading of the lake water was used as a proxy variable to reflect the changes in the lake water quality. Eleven development patterns were analyzed. The first pattern was a forested watershed which maximized the environmental quality through low phosphorus loading of the lake and no lake area crowding. Economic revenues accrued from property tax revenues of the undeveloped land holdings. The second alternative described the sample lake's current development status. From the analysis, to ensure good environmental quality, reduce lake crowding and lake nutrient levels, as well as to maintain a given economic criterion, a combination of first tier residential and commercial development around the lake is suggested. Development should be planned to avoid overcrowding residential patterns.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

GEOLOGIC STUDIES TO IDENTIFY THE SOURCE FOR HIGH LEVELS OF RADIUM AND BARIUM IN ILLINOIS GROUND-WATER SUPPLIES: A PRELIMINARY REPORT,
Illinois State Geological Survey, Urbana; and Illinois State Water Survey, Urbana.
K. Cartwright, S. A. Specht, R. H. Gilkeson, and R. A. Griffin.
Available from the National Technical Information, Springfield, VA 22161 as PB-287 737, Price codes: A03 in paper copy, A01 in microfiche. University of Illinois, Water Resources Center, Urbana, Research Report No 135, (UILU-WRC-78-0135), August 1978. 27 p, 9 fig, 4 tab, 2 ref. OWRT A-084-ILL(1).

Descriptors: *Chemical properties, *Groundwater, Radioactivity, Radioisotopes, Sediments, Solubility, Sulfates, Water supply, *Illinois, Geology, *Aquifer characteristics, Barite, *Barium, *Radium, Thorium, Uranium, *Pollutant identification.

Analyses of water from municipal wells in Illinois by the Illinois Environmental Protection Agency showed that more than 300 wells exceeded the upper limit, 3 picocuries/liter (U.S. Public Health Service, 1962), for gross alpha radiation in drinking water. More than 30 wells exceeded the upper limit, 1 milligram/liter (U.S. Public Health Service, 1962), for barium in drinking water. High levels of radiation in ground water were more extensive in areal distribution than the high levels of barium. All of the affected wells were finished in bedrock, primarily in rocks of the Cambrian and Ordovician systems of northern Illinois. The geologic setting in which the high levels of radiation and barium were documented indicated that the problem was not restricted to Illinois. The source of the radiation in ground water was thought to be the natural occurrence of the radioactive elements uranium-238 and thorium-232 in the aquifer rocks. Analyses of a limited number of rock samples indicated that uranium and thorium concentrations were highest in fine-grained sediments in the aquifer system; the highest concentration was in shales that confine the aquifer. The occurrence of natural radioisotopes in ground water was thought to be complex, involving source rocks, ground-water chemistry, and the hydraulic stress placed on the aquifer. Chemical analyses of rock samples indicated that high concentrations of barium were widespread in rocks of the Cambrian and Ordovician Systems. The concentration of barium in ground water was controlled by solubility equilibria reactions with sulfate ion. A map showing sulfate ion concentration in the Cambrian Ordovician Aquifer could be used to delimit regions where barium might occur at concentrations exceeding 1 milligram/liter.

DEVELOPMENT OF A MANOMETRIC FISH BIOASSAY TECHNIQUE FOR WATER POLLUTION,
Tennessee Technological Univ., Cookeville. Dept. of Civil Engineering.
D. R. Bledsoe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 657, Price codes: A07 in paper copy, A01 in microfiche. M.S. Thesis, December 1977. 116 p, 20 fig, 54 tab, 27 ref, append. OWRT A-034-TENN(2).

Descriptors: *Bioassay, Fish populations, *Lethal limit, Toxicity limits, *Pollutant identification, Respiration rates, Goldfish, Rainbow trout, Carp, Channel catfish, *Tissue bioassay, *Bioassay techniques.

Static 96-hour in vitro bioassays were conducted to determine the median toxicity limit (TLm) of zinc sulfate, phenol, and isopropyl alcohol for common goldfish (Carassius auratus). Respirometric in vivo bioassays were conducted utilizing the same three toxicants; liver tissue homogenates from channel catfish (Ictalurus punctatus), rainbow trout (Salmo gairdneri), and carp (Cyprinus carpio) were utilized as the bioassay test subjects. Oxygen utilization by the tissue homogenates subjected to various concentrations of toxicants was the recorded response. Comparisons between the two bioassay techniques revealed that the respirometric median toxicity limit (RTLm) was closely correlated to the TLm values for each of the toxicants studied. The RTLm was defined as the toxicant concentration at which the slope of the line of the oxygen utilization per gram of liver tissue homogenate versus toxicant concentration was equal to that of homogenate not subjected to a toxicant. (Bustamante-Tenn Tech)

IS CHRYSOTILE ASBESTOS RELEASED FROM ASBESTOS-CEMENT PIPE INTO DRINKING WATER.,
Illinois Univ. at the Medical Center, Chicago.
W. H. Hallenbeck, E. H. Chen, C. S. Hesse, K. Patel-Mandik, and A. H. Wolff.
Journal of the American Water Works Association, Vol. 70, No. 2, p 97-101, February 1978. 2 fig, 8 tab, 21 ref.

Descriptors: *Asbestos, *Potable water, *Electron microscopy, *Rain, Air pollution effects, Water pollution sources, *Pollutant identification, Sampling, *Chrysotile, *Carcinogenesis, Analysis, *Asbestos-cement pipe, *Lake Michigan, *Illinois.

To investigate the possibility that asbestos-cement pipe does, as has been suggested, release asbestos as a contaminant in drinking water, a study was made of water samples from fifteen public water-supply systems before and after their flow through asbestos-cement pipes of various ages, lengths, and diameters. Although several water systems contained moderately aggressive water, no statistically significant release of chrysotile was observed. It may be possible, however, that chrysotile is released from pipes at levels below the detection limits used in this study or at levels that were obscured by laboratory contamination or by chrysotile already present in the water.

DETERMINATION OF CHRYSOTILE ASBESTOS IN RAINWATER,
Illinois Univ. at the Medical Center, Chicago.
C. S. Hesse, W. H. Hallenbeck, E. H. Chen, and G. R. Brenniman.
Atmospheric Environment, Vol 11, p 1233-1237, 1977. 4 tab, 30 ref. OWRT A-071-ILL(6).

Descriptors: *Asbestos, *Electron microscopy, *Rain, Pollutant identification, Air pollution effects, Water pollution sources, *Chrysotile, *Carcinogenesis, Analysis, Chicago, *Illinois.

A feasibility study was undertaken in order to determine if chrysotile asbestos could be found in rainwater. Rainwater samples were collected at one Chicago and two suburban Chicago locations. The Chicago location was near a busy intersection and building construction. The two suburban stations were located in residential areas. All three sites were within four blocks of a major expressway. None of the rainwater samples collected at the suburban sites contained levels of chrysotile which were significantly above laboratory contamination levels. All the rainwater samples from the Chicago location contained significant levels of chrysotile. This finding demonstrates a mechanism by which asbestos could be transferred from air to surface water.

AQUATIC BIOTAL MONITOR,
Tereco Corp., College Station, TX. (Assignee).
W. E. Pequegnat.
U.S. Patent No. 4,084,543, 10 p, 12 fig, 9 ref; Official Gazette of the United States Patent Office, Vol. 969, No. 3, p 890, April 18, 1978.

Descriptors: *Pollutant identification, *Patents, *Monitoring, *Water pollution effects, *On-site investigations, Biota, Water quality, Sampling, Equipment.

An aquatic biotal monitor is disclosed for monitoring the chronic impact of pollution, such as chemical, thermal and turbidity, of aquatic environments upon in situ samples of biota. The monitor includes a top and bottom mounting ring. A water permeable mesh extends between and interconnects the mounting rings and enclosed the bottom ring to form a closed and cylindrical enclosure to retain the biotal sample. The cylindrical enclosure permits the free exchange of ambient water between the outside of the cylindrical enclosure and the inside of the enclosure. The monitor further includes flotation structure attached to the top ring for floating the enclosure in the body of water so that the enclosure monitors the impact of changing aquatic environments on the biotal sample. In addition, the monitor can be anchored at a selected site for studying the impact over periods of time. (Sinha-OEIS)

AUTOMATIC SYSTEM CLEANER FOR REMOTE MONITOR,
J. D. Hilty.
U.S. Patent No. 4,088,575, 6 p, 5 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 970, No 2, p 636, May 9, 1978.

Descriptors: *Patents, *Monitoring, *Sampling, *Water treatment, *Water quality control, *Remote sensing, Slime, Algal poisoning, Equipment protection.

A problem commonly encountered, particularly in warm weather, is that continuing biological activity occurring in water being sampled causes the sample which is monitored remotely to be not truly representative of the water at the instant the water was removed from the lake or stream. A further problem is that the continuing biological activity produces a biological slime which grows on all surfaces contacted by the water being sampled. Such disadvantages are removed by providing an automatically timed apparatus for periodically introducing a biological poison to the water being sampled immediately as the sample is being withdrawn from its source. The periodic introduction of the biological poison functions as a complete system protector to keep all exposed sur-

faces throughout the monitoring system free of slime accumulations. Backwashing means are also provided to preserve the cleanliness of the mechanism which pumps the water being sampled to monitoring devices and operates to enhance the effectiveness of the monitoring and sampling devices. (Sinha-OEIS)

CONTINUOUS STANDARD WATER DELIVERY SYSTEM FOR BIOASSAYS WITH AQUATIC ORGANISMS,
Rijksinstituut voor Drinkwater-voorziening, Leidschendam (Netherlands).
W. Slooff, E. Rab, and T. P. Spierenburg.
The Progressive Fish Culturist, 1978, Vol. 40(3), p 112-114, 2 fig, 4 ref.

Descriptors: *Bioassay, Methodology, Laboratory tests, Laboratory equipment, Water pollution effects, *Water quality, Monitoring, *Water chemistry, Water treatment, Waste treatment, *Water purification dosing apparatus.

The effects of pollutants on aquatic organisms can only be determined in a test water of acceptable quality. In this paper we describe a reliable automatic system which removes most of the undesirable contaminants from the water and adds the proper amounts of certain reconstituting chemicals for the production of uniform test water necessary for reliable and reproducible toxicity test results. IDENTIFICATION OF KEPONE ALTERATION PRODUCTS IN SOIL AND MULLET,
Food and Drug Administration, Washington, DC. Div. of Chemistry and Physics.
A. P. Borsetti, and J. A. G. Roach.
Bulletin of Environmental Contamination and Toxicology, Vol 20, p 241-247, 1978. 2 fig, 1 tab, 11 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Pesticide residues, *Degradation(Decomposition), *Mullets, Path of pollutants, Pesticides, Pesticide kinetics, Gas chromatography, Soil chemistry, Soil analysis, Chemical analysis, Organic compounds, Chemical properties, Chemical wastes, Industrial wastes, Persistence, *Kepone, *Tissue analysis.

The insecticide Kepone has been the subject of intensive residue analyses following recent environmental contamination from Kepone production in Hopewell, VA. The finding of Kepone homologs in soil and fish (mullet) reported here may suggest a possible pathway for the environmental degradation of this highly persistent pesticide, and may indicate the presence of residue components in addition to Kepone per se that should be considered for inclusion in analyses. (EIS-Deal)

A METHOD OF MEASURING BACTERIAL GROWTH IN AQUATIC ENVIRONMENTS USING DIALYSIS CULTURE,
Texas Tech Univ., Lubbock. Dept. of Microbiology.
R. C. Baskett, and W. J. Lulves.
J Fish Res Board Can. 31(3), p 372-374, 1974.

Descriptors: Aquatic environments, Bacterial growth, Brevibacterium sp, Culture, Dialysis, Environment, Farm ponds, *Growth rates, Nutrients, Ponds, Methodology, Measurement.

An inexpensive, easy-to-use method was developed for studying microbial growth and behavior in situ. Dialysis tubing suspended from a styrofoam flotation ring was filled with sterile distilled water, placed in a farm pond, and inoculated with Brevibacterium sp. The visible population within the tubing increased significantly within 96 h, indicating that nutrients in the pond water necessary for growth and multiplication of Brevibacterium sp. diffused through the dialysis membrane. ACID PRECIPITATION IN THE NETHERLANDS,
Department of Environmenta Control, Haarlem (Netherlands).
A. J. Vermeulen.
Environmenta Science and Technology, Vol. 12, No. 9, p 1016-1021, September 1978. 4 fig, 2 tab, 5 ref.

Descriptors: *Precipitation(Atmospheric), *Air pollution, *Europe, Sulfur compounds, Nitrogen compounds, Rain water, Acids, Pollutants, Foreign countries, Water quality, Air pollution effects, *The Netherlands, Acid precipitation.

Various tests of the chemical composition of precipitation indicate that acids are present in larger quantities than would occur naturally. This phenomenon is attributed to ever increasing sulfur dioxide and nitrogen oxides air pollution. Around 1966, the highest acid precipitation measurements in the world (on a yearly basis) were made in The Netherlands. After 1967, the acid concentrations of rain decreased, simultaneously with a considerable reduction in SO2 emissions. The coming years in The Netherlands will be characterized by a decreasing use of natural gas and an increasing use of oil with this consequence: an increasing emission of SO2. Acid deposition may increase from an average of 140 mg/sq m (expressed as H(+)) in the year 1985 (with high extreme values of 300 mg/sq m) to an average of 370 mg/sq m in the year 2000 (with high extreme values of 700 mg/sq m). The natural background deposition would be about 1-3 mg/sq m per year. The total effects of such an acidification of precipitation cannot be predicted at present. (Humphreys-ISWS)

ION SELECTIVE ELECTRODES IN WATER QUALITY ANALYSIS,
Municipal Environmental Research Lab., Cincinnati, OH. Water Supply Research Div.
R. C. Thurnau.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-285 724, Price codes: A03 in paper copy, A01 in microfiche. Report No EPA-600/2-78-106, May 1978. 37 p, 18 fig, 10 tab, 54 ref.

Descriptors: *Pollutant identification, *Water analysis, *Water quality, *Ions, *Electrodes, *Specific ion electrode, *On-site laboratories, Sampling, Monitoring, Hydrogen ion concentration, Alkalinity, Calcium, Chloride, Fluoride, Water hardness, Nitrate.

A mobile water quality laboratory capable of monitoring 19 water quality parameters is described. Among the instruments included in this laboratory, ion specific electrodes have shown great potential, especially for monitoring such parameters as alkalinity, calcium, chloride, fluoride, hardness, nitrate, and pH. The operating principle for all specific ion electrodes is based on creation of a classical concentration potential across a permeable membrane, that is, it follows the Nernst equation. The pH and chloride electrodes were housed in a commercial unit and linked to the computer with a minimum number of operating problems. Other parameters required more development and required ionic strength or pH buffers to swamp out problems of activity and ionic strength. Test periods usually lasted about one week. The electrodes functioned quite well with accuracy comparable to statistics found in Standard Methods for the Examination of Water and Wastewater. (Majtenyi-IPA)

ANALYSIS OF RADIOACTIVE CONTAMINANTS IN BY-PRODUCTS FROM COAL-FIRED POWER PLANT OPERATIONS,
Environmental Monitoring and Support Lab., Cincinnati, OH.
H. Krieger, and B. Jacobs.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 365, Price codes: A03 in paper copy, A01 in microfiche. Report No EPA-600/4-78-039, July 1978. 31 p, 7 fig, 3 tab, 13 ref, 1 append.

Descriptors: Pollutant identification, *Environmental pollution, *Air pollution, *Radioactive wastes, *Radioisotopes, *Electric powerplants, *Coals, Fossil fuels, Uranium, Radium, Thorium, *Radiochemical analysis, Radiation, Public health, Fly ash, Scrubber sludge, Spectrometry.

In addition to the sulfur and nitrogen oxides commonly associated with environmental discharges of coal-fired plants, significant concentrations of naturally radioactive contaminants are produced, including compounds of radium, thorium, and uranium. A study was conducted to identify and quantify the major radionuclides detected in fossil fuel powerplant discharges. Samples of coal, fly ash, bottom ash, and scrubber sludge were collected from different regions of the U.S. and analyzed for radium, thorium, and uranium. Standard radiochemical procedures were modified to obtain reproducible results for the variety of samples analyzed. These can be used to calculate a radioactivity balance on the basis of normal plant operations. The spectrum of activity levels is tabulated in a variety of samples and compared with the results from non-destructive spectrometry and radiochemical separations. It is concluded that, for the present, the expanding fossil-fuel powerplant operations present no radiation hazard. Methods of analysis are described in the appendix. (Majtenyi-IPA)

YELLOWSTONE NATIONAL PARK SURVEY MAY-AUGUST 1970, INCLUDES SODA BUTTE SURVEY, MAY-OCTOBER 1969.
Environmental Protection Agency, Kansas City, MO. Region VII.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 664, Price codes: A16 in paper copy, A01 in microfiche. December 1970. 352 p.

Descriptors: *Yellowstone National Park, *Soda Butte, *Water pollution, *Water quality, *Missouri River, *Yellowstone River, National Parks, Wyoming, Missouri, Montana, North Dakota, Organic loading, Basic data collections, Biochemical oxygen demand, Ammonia, Nitrates, Nitrogen, Sulfates, Water temperature.

Basic data from the Yellowstone National Park water quality survey of May-August 1970 and the Soda Butte survey of May-October 1969 are presented in tables; no text is included. Indicators monitored were water temperature, air temperature, streamflow, dissolved oxygen, pH, conductivity, turbidity, hardness, chloride, sulfate, BOD, ammonia, total Kjeldahl nitrogen, nitrite- and nitrate-nitrogen, orthophosphorus, calcium, sodium, potassium, fluoride, boron, copper, iron, manganese, zinc, selenium, radium-226, magnesium, barium, lead, cyanide, arsenic, phenols, residue, uranium, silica, total organic carbon, coliforms, fecal coliforms, and streptococci. Various rivers were monitored, including the Missouri and Yellowstone. (Lynch-Wisconsin)

AUTOMATED DETERMINATION OF SELENIUM IN WATER,
Geological Survey, Denver, CO. Water Resources Div.
G. Pyen, and M. Fishman.
Atomic Absorption Newsletter, Vol. 17, No. 2, p 47-48, March-April 1978. 1 fig, 2 tab, 3 ref.

Descriptors: *Water analysis, *Chemical analysis, *Trace elements, *Analytical techniques, *Laboratory tests, *Selenium, Atomic absorption spectrometer.

An automated method to determine both inorganic and organic forms of selenium in water is described. Organic selenium-containing compounds are first manually decomposed by hydrochloric acid-potasssium persulfate digestion. The selenium liberated, with inorganic selenium originally present, is reduced to selenite with stannous chloride and potassium iodide and then to hydrogen selenide with sodium borohydride. The hydrogen selenide is stripped from the solution with the aid of nitrogen and is then decomposed in a tube furnace heated to 800 degrees C. Selenium concentrations are determined by an atomic absorption spectrometer. Thirty samples per hour can be analyzed to levels of 1 microgram selenium per liter.

LABORATORY STUDIES OF GAS TRACERS FOR REAERATION,
Geological Survey, Bay St. Louis, MS. Water Resources Div.
R. E. Rathbun, D. W. Stephens, D. J. Shultz, and D. Y. Tai.
ASCE Proceedings, Journal of the Environmental Engineering Division, Vol. 104, No. EE2, Paper 13679, p 215-229, April 1978. 6 fig, 3 tab, 23 ref, 2 append.

Descriptors: *Reaeration, *Tracers, *Gases, Laboratory tests, Least squares method, Oxygenation, Absorption, Evaluation, Hydrocarbon gases, Reaeration coefficient, Nonlinear least squares.

Laboratory studies were conducted to determine the rates at which ethylene and propane desorbed from a water bath relative to the rate at which oxygen was absorbed by the same water. The ratios between the oxygen absorption coefficient and the hydrocarbondesorption coefficient were 1.15 and 1.29 for ethylene and propane, respectively. These ratios, which were independent of mixing conditions within the water and independent of water temperature over the range of 20 to 30 degrees C, serve as the basis for a tracer technique for measuring reaeration coefficients of streams. Nonlinear least squares procedures were used in the analysis of the concentration as a function of time data. Comparison of 2-parameter and 3-parameter procedures showed that the 3-parameter procedure was able to fit the data better in terms of a foot-mean-square error. However, estimats of the saturation concentration for dissolved oxygen with the 3-parameter procedure were unrealistic. Therefore, a 2-parameter procedure with the saturation concentration fixed at a literature value for the specific temperature and corrected for barometric pressure was used. The 2-parameter procedure was also used for the hydrocarbon data with the quilibrium concentration fixes at zero.

A PERIPHYTIC MICROFLORA ANALYSIS OF THE COLORADO RIVER AND MAJOR TRIBUTARIES IN GRAND CANYON AND VICINITY,
Northern Arizona Univ. Flagstaff. Dept. of Biological Science.
D. B. Czarnecki, D. W. Blinn, and T. Tompkins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 761, Price codes: A06 in paper copy, A01 in microfiche. Grand Canyon National Park, Colorado River Research Program Report No. CRRP-06, 106 p, June 1976. 26 tab, 48 ref.

Descriptors: *Periphyton, *Oligotraphy, *Colorado River, Cyanophyta, Chlorophyta, Rhodophyta, Water quality, Ecosystems, Diatoms, Microorganisms, Aquatic algae, Trophic level, Colorado River basin, Bioinicators, Seasonal, Colorado, *Species diversity, Grand Canyon National Park.

A periphytic microflora analysis was conducted seasonally at selected sites on major tributaries and at locations along the Colorado River in Grand Canyon National Park. A reltively high algal diversity was displayed yieling 345 taxa. The high diversity in combination with the overall scaricity of pollution tolerant species indicates a fairly young and possibly oligotrophic system. Major differences in taxa exist above and below Glen Canyon Dam. Based on ecological preferences of major taxa, the Colorado River can be considered to be a high alkalinity and conductivity system. (EIS-Deal)

LABORATORY STUDY OF THE RELEASE OF PESTICIDE AND PCB MATERIALS TO THE WATE COLUMN DURING DREDGING AND DISPOSAL OPERATIONS,
Envirex, Inc., Milwaukee, WI.
R. Fulk, D. Gruber, and R. Wullschleger.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A026 685, Price codes: A06 in paper copy, A01 in microfiche. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Report No. D-75-6, 112 p, December 1975. 10 fig, 43 tab, 4 app. 25 ref.

Descriptors: *Dredging, *Bottom sediments, *Pesticide residues, Chemical analysis, Water analysis, Pesticides, Polychlorinated biphenyls, Organic compounds, Dieldrin, DDT, Chlorinated hydrocarbon pesticides, Aldrin, Oil, Path of pollutants.

Sediments, Water column water, and interfacial water samples were obtained from dredged areas. Samples were analyzed for pesticide materials, PCB, oil and grease, total organic carbon, and silt and clay fraction. Measureable amounts of PCB were found in almost all samples. Of the pesticides, dieldrin and DDT compounds were the most common. Aldrin and 2,4-D esters were present in a few samples. No correlation was found between the amount of TOC, oil and grease, and silt and clay fraction, and the sediment PCB content or the interstitial water PCB content. (EIS-Deal)
W79-00286

MANUAL OF ANALYTICAL QUALITY CONTROL FOR PESTICIDES AND RELATED COMPOUNDS IN HUMAN AND ENVIRONMENTAL SAMPLES,
Lafayette Coll., Easton, PA. Dept. of Chemistry.
J. Sherma.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 019, Price codes: A13 in paper copy, A01 in microfiche. U.S. Environmental Protection Agency, Health Effects Research Laboratory, Report EPA-600/1-76-017, February 1976. 290 p., 63 fig, 21 tab, 381 ref.

Descriptors: *Pesticide kinetics, *Chemical analysis, Gas chromatiography, Pesticides, Laboratory tests, Analytical techniques, Bioassay, Pesticide residues, Polychlorinated biphenyls, Chemical degradation, Chemical properties, Path of pollutants, Quality control, Testing procedures, Methodology, *Tissue analysis.

This manual primarily provides the pesticide chemist with a systematic protocol for the prevention and control of analytical procedures which arise in the analysis of human or environmental media. The sections dealing with inter- and intralaboratory quality control, the evaluation and standardization of materials used, and the operation of the gas chromatograph are intended to highlight and provide advice in dealing with many problems which constantly plague the pesticide analytical chemist. Techniques for confirming the presence or absence of pesticides in sample materials are treated, at some length. This highly important area provides validation of the data obtained by the more routine analytical procedures. Last, but by no means least in importance is a short dissertation of the value and need for systematic training programs for pesticide chemists. (EIS-Deal)

TRACING SEWAGE EFFLUENT RECHARGE - TUCSON, ARIZONA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
T. R. Schultz, J. H. Randall, L. G. Wilson, and S. N. Davis.
Paper presented at The Third National Ground Water quality Symposium, Las Vegas, Nevada, September 15-17, 1976. 8 p, 6 fig, 2 tab, 24 ref. OWRT A-063-ARIZ(2), 14-34-0001-7006.

Descriptors: *Sewage effluents, *Gas chromatography, Recharge, Water pollution sources, Pollutant identification, *Tracers, Ground-water contamination.

Dry washes or river beds are often used by southwestern communities to dispose of treated sewage effluent. Because many of these communities rely on ground water as a water supply, there is concern that this disposal practice may contaminate local aquifers. This has led to implementation of monitoring and tracing programs to quantify effluent and ground-water interactions and to development of efficient, easily used predictive models. The treated sewage effluent from the City of Tucson treatment plant has historically been used for irrigation and/or discharged to the normally dry Santa Curz River. Numerous sampling programs have been undertaken to quantify the chemical quality, temperature, and microbiological activity of the ground water in the area ner the Santa Cruz. Ground-water regions with high chloride and nitrate concentrations tend to be associated with areas irrigated with sewage effluent. Quality degradation due to channel recharge is not as evident because the effluent recharge is restricted by fine materials plugging the channel deposits. Recharging water tends to mound near the contact between the Recent and Fort Lowell formations spreading laterally more rapidly than downward. A new tracer, trichlorofluoromethane (trade name Freon 11, Cl3CF) with applications similar to environmental tritium is being evaluated. Cl3CF enters the hydrologic cycle when it is partioned between the gas and liquid phases during raindrop formation. Cl3CF in water samples is separated and quantitatively measured by a gas chromatograph with pulsed electron-capture detector.

CHEMISTRY OF SMALL NORWEGIAN LAKES, WITH SPECIAL REFERENCE TO ACID PRECIPITATION,
Norsk Inst. for Vannforskning, Blindern.
R. F. Wright, and A. Henriksen.
Limnology and Oceanography, Vol. 23, No. 3, p 487-498, May 1978. 8 fig, 3 tab, 33 ref.

Descriptors: *Lakes, *Water chemistry, *Surveys, *Acidic water, Chemical analysis, Ions, Hydrogen ion concentration, Chemicals, Geology, Precipitation(Atmospheric), Surface waters, Weathering, Salts, Acids, Air pollution, Water pollution, Limnology, Acid precipitation.

The concentrations of major ions were determined in 155 representative, small, pristine lakes in southern Norway. The chemistry of these lakes appears to be governed by three factors: atmospheric inputs of seawater salts supply most of the Cl and Na; acid precipitation supplies most of the S94 and H(+); and terrestrial inputs of chemical weathering products account for most of the Ca, Mg, and HC03. The interaction of acid precipitation and geologic environment largely explains pH levels in these lakes. Lakes in granitic terrains have low concentrations of major ions, low buffer capacities, and are often acidic (pH less than 5) when located in areas subject to acid precipitation. Sulfate is the major anion. Lakes in granitic terrains that do not receive highly acidic precipitation have pH levels greater than 5.5, and bicarbonate is the major anion. (Sims-ISWS)

A COMPARISON OF CERAMIC AND TEFLON IN SITU SAMPLERS FOR PORE WATER DETERMINATIONS,
Harbor Branch Foundation, Inc., Fort Pierce, FL.
C. F. Zimmermann, M. T. Price, and J. R. Montgomery.
Estuarine and Coastal Marine Science, Vol. 7, No. 1, p 93-97, July 1978. 2 fig, 2 tab, 12 ref.

Descriptors: *Pore water, *Sampling, *Instrumentation, *Laboratory tests, Nutrients, Testing, Methodology, Estuaries, Sediments, Ammonia, Phosphates, Nitrates, Nitrites, Silica, Porous ceramic samplers, Porous Teflon samplers.

A laboratory comparison study of porous Teflon and porous ceramic samplers which can be used to collect sediment pore water was performed for varying concentrations of NH4, PO4, NO3, NO2 and Si. Significant differences were evident between nutrient concentrations before and after being filtered through ceramic samplers. Mean per cent recoveries were 11% + or - 0.9 for NH4, 43% + or - 1.1 for PO4, 96% + or - 0.1 for NO3, 85% + or - 0.0 for NO2, and 111% + or - 0.2 for Si (standard deviations for N = 5). Per cent recoveries using the Teflon sampler were from 98-106% for all nutrients tested. The Teflon samplers can be placed in shallow estuarine sediments and samples collected over a 14-day without disturbing the sediment or clogging the sampler. With minor modifications, the sampler can be used to analyze salinity, chlorinity, and trace metals as well as nutrients in pore waters and would be especially valuable when frequent sampling at the same depth and location may be necessary over an extended period of time (i.e., diurnal or tidal studies). (Humphreys-ISWS)

ISOTOPIC COMPOSITION OF SULFUR IN PRECIPITATION WITHIN THE GREAT LAKES BASIN,
Canada Centre for Inland Waters, Burlington (Ontario).
J. O. Nriagu, and R. D. Coker.
Tellus, Vol. 30, No. 4, p 365-375, August 1978. 5 fig, 3 tab, 26 ref.

Descriptors: *Sulfur, *Precipitation(Atmospheric), *Great Lakes, *Great Lakes region, Surveys, Sampling, Isotope studies, Sulfur dioxide, Air pollution, Seasonal Spatial distribution, Temporal distribution, Pollutants, Water pollution, Water pollution sources, *Great Lakes Basin.

By monitoring both the isotope ratio variations and the concentrations of sulfur in bulk precipitation samples, the seasonal changes in the relative contributions of airborne sulfur from bacteriogenic and anthropogenic sources were assessed. Although the delta 34S values during the winter months are generally higher than those of the summer months by about 4 parts per thousand, there is no corresponding seasonal variability in sulfur concentrations. In general, the average SO2 concentrations at urban stations are also higher during the winter months. Precipitation samples at urban sites usually have higher sulfur contents and are enriched in 34S compared to samples at rural and remote locations. On the basis of these observations, it was suggested that the bacteriogenic sulfur emissions within the basin may account for 10-30% of all the sulfur emitted in the basin. The data suggested that the biogenic release of sulfur from land areas may be smaller than the figures employed in many models of the global sulfur cycle. (Sims-ISWS)

NCASI Stream Improvement Technical Bulletin, No. 305, 20 p, March, 1978. 2 fig, 20 ref, 7 tab.

Descriptors: *Pulp wastes, *Biochemical oxygen demand, *Testing procedures, Water analysis, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Suspended solids, Analytical techniques, Testing, Refrigeration, Waste water(Pollution), Physical properties, Sampling, Pollutants, Pollutant identification, Waste storage.

The required routine measurement of BOD and suspended solids concentration of final effluents is an integral part of almost every NPDES (National Pollutant Discharge Elimination System) permit but these measurements are time consuming. To reduce the time required for their conduct within the confines of approved methods, an investigation was conducted by the NCASI Southern Regional Center. It showed that external inoculum sources, such as domestic sewage, are not needed in the BOD measurement of biologically treated effluents (e.g., treated bleached kraft mill effluents). Biologically treated effluents were also demonstrated to serve as satisfactory sources of seed for primary effluents in the BOD test, although seeding was not required for most primary effluents. Refrigerated storage (1-13 C) during composite effluent sampling biased the measured BOD upward; 18% and 6% of the refrigerated samples showed an increase of 5 ppm or more and 9 ppm or more BOD, respectively. Although the impact of refrigerated storage was not uniform from mill to mill (nor occasionally among samples at a single mill), the frequent occurrence of measured elevated BOD values with refrigerated storage was evidlent. The initiation of refrigerated storage may, therefore, be significant in an individual mill's ability to meet a discharge permit condition. Favorable mill experiences with the 1-day BOD test in effluent quality management programs are described. (Swichtenberg-IPC)

Sbornik Trudov, Tsentralnyi Nauchno-Issledovatel'skii Institut Bumagi, No. 10, p 213-216, 1975. 1 fig, 5 ref, 1 tab.

Descriptors: *Sulfite liquors, *Pollutant identification, *Magnesium, *Flame photometry, Wastes, Industrial wastes, Pulp wastes, Pulp and paper industry, Water pollution sources, Effluents, Ion exchanges, Cation exchange, Waste identification, Chemical analysis, Analytical techniques, Spent sulfite liquor.

The method described for determining the magnesium in magnesium-base spent sulfite liquors consists in separating the organic and mineral components on an ion-exchange column filled with a cation-exchange resin, eluting magnesium with HCl solution, and determining it in the eluate by flame photometry. The procedure was applied to spent liquors from laboratory sulfite cooks, and the results were compared with those obtained by the trilonometric method. The results from the two methods differed by not more than 4%. The sensitivity of the flame-photometric determination is 10 micrograms/ml. The method, which is less time-consuming than the presently used method and is more accurate, can be recommended for use in research and mill laboratories. (Stapinski-IPC)

Descriptors: *Pulp wastes, *Sulfite liquors, *Electrodialysis, *Membranes, Energy, Electrical resistance, Water pollution sources, Wastes, Industrial wastes, Pulp and paper industry, Temperature, Water pollution treatment, Waste treatment, Membrane processes, Dialysis, Separation techniques, Spent sulfite liquor.

The electric resistance of the cation-selective Mk-40 membrane was studied under conditions corresponding to the dialysis process described previously for magnesium-base spent sulfite pulping liquor. It is shown that the resistance of the membrane is determined to a large extent by the degree of base recovery and the temperature of the system, and to a lesser degree by the concentration of the spent liquor. At 22-58C and a liquor concentration range of 77-355 g/liter, the reduction of the membrane resistance is 8-10, 4, and less than 2 ohm-cm/degree centigrade for degrees of recovery of zero, 41, and 69%, respectively. ANALYSES OF PAPER MACHINE WATERS WITH ION SPECIFIC ELECTRODES. PART IV. SULFATE DETERMINATION USING PB(2+) ION SPECIFIC ELECTRODE AND VARIOUS MEASUREMENT METHODS,
Valmet Oy, Jyvaskyla (Finland).
J. Korhonen, and P. O. Lumme.
Paperi ja Puu, Vol. 60, No. 2, p 81-82, 84-86, February, 1978. 2 fig, 13 ref, 6 tab.

Descriptors: *Water analysis, *Sulfates, *Pulp wastes, Electrodes, Lead, Ions, Analytical techniques, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Storage, Waste storage, Bacteria, Hydrogen sulfide, Volumetric analysis, White water(Paper machine), Waste water(Pollution).

The Pb(II)-specific electrode was applied to the determination of sulfate ion concentration in paper machine white waters, using direct titration or Gran's method; in the latter, the end-point was established with the help of Gran's plot paper. Samples were collected from two paper machines, one of which contained hydrogen sulfide-forming bacteria in its water circuit. Some samples were analyzed immediately, others were stored in bottles and tested at weekly intervals to examine the effect of anaerobic hydrogen sulfide formation on the analytical data. Direct-titration values were a few percent below the gravimetric data. Gran's technique produced somewhat greater negative errors. Although the concentrations obtained from samples subject to hydrogen sulfide formation showed some variations, the measurements from the other samples had good reproducibility. EVALUATION OF DONNAN DIALYSIS FOR THE ENRICHMENT OF CATIONS,
Southern Illinois University, Carbondale, Department of Chemistry and Biochemistry.
J. E. DiNunzio.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 182, Price codes: A08 in paper copy, A01 in microfiche. Ph.D Dissertation, September 1977. 137 p, 24 fig, 19 tab, 107 ref. OWRT A-087-ILL(2).

Descriptors: *Chemical reactions, *Dialysis, *Cations, *Ion exchange, *Heavy metals, Electrodialysis, Electrolytes, Chemical analysis, Water analysis, Absorption, Spectroscopy, Ion transport, Membranes, Transfer, Toxicity, Ions, Copper and mercury enrichment, Atomic absorption spectrometry, Ion selective membranes, Cation enrichment, Donnan Dialysis.

The rate of enrichment of cations by Donnan dialysis depends upon the identity of the ion exchange membrane counterion, the ionic strength of the receiver electrolyte, the stirring efficiency and the temperature. With counterions selected from Periodic Groups IA-IIIA, the rate increased with group number and with smaller atomic number within a group; hence Al(III) was the ideal receiver electrolyte cation. Enrichment factors of 10 were accomplished in 30 minutes when Cu(II) was the test species. The method compares favorably, in terms of precision and sensitivity, to solvent extraction as an enrichment method to use in conjunction with atomic absorption spectrometry; however, it is applicable to a wider range of cations. The method was applied to the enrichment of Hg(II) from natural samples. Acidification was necessary to break up the neutral hydroxy complex.

INVESTIGATION OF RAINWATER FOR THE PRESENCE OF ASBESTOS,
Illinois Univ. at the Medical Center, Chicago.
C. S. Hesse.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 084, Price codes: A04 in paper copy, A01 in microfiche. M.S. Thesis, 1977. 47 p, 4 fig, 5 tab, 62 ref. OWRT A-071-ILL(4).

Descriptors: *Rain water, *Asbestos, Sampling, Data collections, Filtration, Illinois, Water pollution sources, Pollution identification, *Chrysotile, Chicago.

A feasibility study was undertaken in order to determine if chrysotile asbestos is present in rainwater. Rainwater samples were collected at one Chicago and two suburban Chicago locations. The Chicago location was near a busy intersection and building construction. The two suburban stations were located in residential areas. None of the suburban rainwater sampls contained levels of chrysotile which were significantly above laboratory contamination levels (alpha = .05). All the Chicago rainwater samples contained significant levels of chrysotile. This finding suggests a mechanism by which asbestos may be transferred from air to surface water.

RECOVERY OF SANITARY-INDICATOR BACTERIA FROM STREAMS CONTAINING ACID MINE WATER,
West Virginia Univ., Morgantown.
M. L. Double.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 156, Price codes: A07 in paper copy, A01 in microfiche. M S Thesis, 1977. 117 p, 2 fig, 25 tab, 109 ref, append. OWRT A-033-WVA(1).

Descriptors: *Acid mine water, *Coliforms, *Enteric bacteria, *Sewage bacteria, *Streptococcus, Bacteria, Bioindicators, Domestic wastes, E. Coli, Filters, Membranes, Meus-membrane filters, Microorganisms, Mine water, Separation techniques, Sewage effluents, Water pollution, Water quality, Enriched culture media, Bacterial-recovery methods.

Improved membrane-filtration methods for better recovery of sanitary-indicator organisms from aquatic environments containing acid mine water were evaluated. Adjustment of sample pH, use of various membrane-filter brands, and incorporation of an enrichment step were examined for samples from various aquatic environments. Comparison of the recovery efficiency of various methods used to enumerate coliform bacteria from water indicated that generally, multiple-tube fermentation techniques give recovery superior to membrane-filtration procedures, but use of resuscita-

tion broth as an enrichment medium greatly improved the recovery efficiency of the membrane-filtration technique. In some instances, recovery densities of the enriched membrane-filtration procedures, but use of resuscitation broth as an enrichment medium greatly improved the recovery efficiency of the membrane-filtration technique. In some instances, recovery densities of the enriched membrane-filtration method were greater than the Most-Probable-Number technique. Comparison of three brands of membrane filters revealed that Gelman GN-6 yielded the highest coliform recovery and Nuclepore the least. Other methods used to improve the membrane-filtration efficiency proved ineffective. Qualitative studies of the Hartman Run drainage area showed that acid mine water may produce a differential inhibitory effect to members of the Enterobacteriaceae. The use of a two-step enrichment procedure improved the recovery of certain genera, Klebsiella. That enrichment techniques be adopted to aid in assessing the sanitary quality of water is recommended.

CHLOROFLUOROCARBONS AS HYDROLOGIC TRACERS A NEW TECHNOLOGY,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
J. H. Randall, and T. R. Schultz.
Hydrology and Water Resources in Arizona and the Southwest, Vol. 6, p 189-195, 1976. OWRT A-063-ARIZ(3), 14-34-0001-7006.

Descriptors: *Gas chromatography, *Tracers, Air pollution, Atmosphere, Pollutant identification, *Chlorofluorocarbon, Dating water.

The nationwide research undertaken to study environmentally dispersed chlorofluorocarbons introduced into the atmosphere from aerosol cans and refrigeration systems has indicated that these compounds are potentially ideal hydrologic tracers, especially Freon-11 (Cl3CF). The major advantages of Cl3CF as a tracer are its non-polluting conservative nature, extremely low toxicity and sorptivity on clays, quantifiable build-up in the atmosphere, and a detection limit of about 10-14 grams. Quick and inexpnsive detection of Cl3CF can be done using a field-operable gas chromatograph with a pulsed electron-capture detector system. The presence of Cl3CF in ground water, indicating an age of less than 30 years, will permit delineation of recent recharge areas. The absolute age of the recharging water is proportional to the atmospheric concentration of Cl3CF at the time of recharge. The simple quantifiable increase of Cl3CF in the atmosphere should therefore yield more accurate ages than those determined by tritium analysis.

Descriptors: *Idaho, *Upper Snake River Basin(Ida), *Water pollution sources, Sewage effluents, Municipal wastes, Industrial wastes, Chlorinated hydrocarbon pesticides, Pesticide residues, *Non-point pollution sources, Pollutants, *Cadmium, *Mercury, Portneuf River(Ida), Snake River(Ida), *America Falls Reservoir(Ida).

The Upper Snake River Basin contained elevated amounts of cadmium and mercury. Three sources are possible: sewage effluents from large towns in the area, run-off from irrigated lands (both cadmium and mercury are found in phosphate fertilizers), or drift from air currents carrying emissions from phosphate and cement plants. Industrial and municipal facilities located adjacent to the lower Portneuf River near Pocatello appear to be contributing cadmium and mercury to the aquatic environment. Chlorinated hydrocarbons detected in dangerous levels in reservoir fishes are usually associated with agricultural pesticides that have entered the water; however, low solubility in water results in undetectable levels in both the Portneuf and Snake Rivers.

CHARACTERIZATION AND TREATMENT OF STORMWATER RUNOFF,
Colorado Univ., Boulder. Dept. of Civil Environmental and Architectural Engineering.
F. W. Pontius.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 576, Price codes: A16 in paper copy, A01 in microfiche. M.S. Thesis, 1977. 325 p, 82 fig, 84 tab, 70 ref, append. OWRT A-028-COLO-(3). 14-34-0001-8006.

Descriptors: *Urban runoff, *Stormwater, Runoff, Water quality, *Urban drainage, Water pollution treatment, Water pollution sources, *Waste water treatment, Cities, Water treatment, Chemical precipitation, Ferric chloride, Lime, Filtration, Sedimentation.

A 125 acre urban area and a 15 acre agricultural area were selected for study. The urban area was serviced by separate storm and sanitary sewer systems and had an average population density of 12 persons per acre. The agricultural area was cultivated in alfalfa and had an average slope of 2.5 feet per 100 feet. Concentrations of pollutants in the urban stormwater runoff were found to vary widely. Solids, COD, chlorides, and bacterial densities were found at significant levels. Nutrient levels remained low throughout the study period. Pollutant contributions due to stormwater runoff from the urban area were significantly lower than those reported in previous studies. This was attributed to the differences in land use between the areas investigated. The significance of snowmelt runoff from the urban area appeared to be minor when compared to the estimated pollutants contributed by treated sewage from a similar size area. Processes evaluated for the treatment of urban stormwater runoff were plain sedimentation, chemical clarification using alum, ferric chloride, and lime, and filtration. Clarification with ferric chloride was the most effective process, yielding an average pollutant removal efficiency of 89 percent. Filtration and clarification with alum were also effective, resulting in average pollutant removals of 87 and 84 percent, respectively. The effectiveness of plain sedimentation was found to depend on the nature of the individual stormwater samples. A detention time of four hrs. resulted in an overall removal efficiency of only 42%.
W79-00005

FACTORS CONTROLLING VARIATIONS IN RIVER WATER QUALITY IN KANSAS,
Kansas Water Resources Research Inst., Manhattan.
D. O. Whittemore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 578, Price codes: A04 in paper copy, A01 in microfiche. Contribution No 197, August 1978. 46 p, 14 fig, 8 tab, 12 ref. OWRT A-080-KAN(1). 14-34-0001-8018.

Descriptors: *Rivers, Water quality, Kansas River basin, *Arkansas River basin, Runoff, Watershed management, Chemical precipitation, Watershed studies, *Water quality control, *Quickflow, *Baseflow.

The most important factor controlling the quality of river waters in Kansas is the variation in the amounts and chemistry of quickflow (reflecting dissolution of constituents from soils and near surface alluvium) versus baseflow (mainly groundwater inflow). Given similar bedrock, the higher the average annual precipitation and the lower the average evaporation rate, the lower the total dissolved solids (TDS) of both quickflows and baseflows. Quickflows have lower TDS and Na/(Na + Ca) than baseflows. Primary sources of high TDS in baseflows are saline formation waters and dissolution of halite and gypsum; in western and central Kansas evaporative concentration also contributes to high TDS and can increase Na/(Na + Ca) slightly by calcite crystallization. Two types of cyclic relationships occur in chemical hydrographs of precipitation or snowmelt events: a quickflow flushing-dilution cycle follows a counterclockwise loop and a quickflow dilution-saline groundwater discharge cycle a clockwise loop when discharge is plotted versus specific conductance, TDS, or Na/(Na + Ca). A procedure is proposed for controlling the quality of river waters receiving saline groundwaters: a system of small flood retarding and recharge structures with baseflow release drains should be built far enough upstream of saline inflow areas, that groundwater recharge increases good quality baseflow and decreases mineralized discharges.

UPTAKE AND FATE OF DI-2-ETHYLHEXYL PHTHALATE IN AQUATIC ORGANISMS AND IN A MODEL ECOSYSTEM,
Illinois Univ. at Urbana-Champaign Dept. of Zoology and Entomology.
R. L. Metcalf, G. M. Booth, C. K. Schuth, D. J. Hansen, and P. Y. Lu.
Environmental Health Perspectives, Experimental Issue, No. 4, p 27-34, 1973. 5 fig, 3 tab, 11 ref.

Descriptors: *Plastics, *Absorption, *Biodegradation, Organic compounds, Path of pollutants, Animal metabolism, Daphnia, Mosquitos, Clams, Food chains, Food webs, Chemical properties, Industrial wastes, Chemical wastes, *Phthalates, *Teratogens, *Biomagnification, *Tissue analysis, Di-z0ethylhexyl phthalate.

The experiments demonstrated that DEHP is a microchemical environmental pollutant which is rapidly biomagnified by a variety of plants and

animals in an aquatic system. DEHP is biodegraded very slowly in algae, Daphnia, mosquito larvae, snails, and clams and more rapidly in fish. However, DEHP closely resembles DDT in rate of uptake and storage, and it obviously partitions strongly in the lipids of plants and animals and is concentrated through food chains. The biomagnification of DEHP together with its teratogenic properties and its enormous rate of production and ubiquitous use indicate the need for much further study of its environmental distribution and fate. Present data suggest the need for restrictions on the use and waste disposal of DEHP. (EIS-Deal)

STUDIES ON THE PATHWAYS AND EFFECTS OF CADMIUM IN CONTROLLED ECOSYSTEM ENCLOSURES,
Kiel Univ. (West Germany). Inst. fuer Meerekunde.
K. Kremling, J. Piuze, K. von Brockel, and C. S. Wong.
Marine Biology, Vol. 48, p 1-10, 1978. 11 fig, 3 tab, 26 ref.

Descriptors: *Cadmium, *Phytoplankton, *Biological communities, Ecosystems, Heavy metals, Water pollution effects, Membrane processes, Biological membranes, Toxicity, On-site data collections, Comparative productivity, Productivity, Biomass.

Two experiments were performed during 1975 and 1976, in which cadmium was added to seawater and its plankton enclosed in plastic containers moored in Saanich Inlet (Vancouver Island, Canada), as part of the CEPEX project. In both experiments, two enclosures were used; one was spiked with about 1.3 microg l-1 cadmium, while the other served as a control, to assess the fate of the added metal and its effect on marine phytoplankton. In both experiments, the pattern of biological events was found to be very similar for the cadmium-treated bag and for the control. Furthermore, there was no marked differences in the phytoplankton species composition, thus indicating that at this concentration level cadmium did not affect the ecosystem. The rate of removal of cadmium by biological processes was relatively slow. Experiments on the mechanism of cadmium binding indicated that the major part of the particulate metal is loosely bound to the outer cell membranes. (EIS-Deal)

TRANSURANIC NUCLIDES IN PLAICE (PLEURONECTES PLATESSA) FROM THE NORTH-EASTERN IRISH SEA,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Radiobiological Lab.
R. J. Pentreath, and M. B. Lovett.
Marine Biology, Vol. 48, p 19-26, 1978. 2 fig, 8 tab, 8 ref.

Descriptors: *Radioisotopes, *Nuclear wastes, Animal metabolism, Path of pollutants, Nuclear energy, Radioactive wastes, Fish physiology, Public health, Radioactive waste disposal, Water pollution sources, Hazards, Marine fish, *Plaice, Pleuronectes, *Tissue analysis, *Americium, *Plutonium, Curium, Flounders, Irish Sea.

The concentrations of a number of alpha-emitting nuclides, 238Pu, 239/240Pu, 241Am, 242Cm and 243/244Cm have been determined in the organs of plaice caught in the vicinity of a nuclear fuel reprocessing plant. Fish were taken for analysis every 3 months for a period of 2 years. During this period, the highest concentrations of plutonium and mericium nuclides were found in the kidney and the lowest in muscle. In all of the organs analysed, the concentrations of americium were greater than those of plutonium: they were also greater than plutonium when related to the rates of discharge of these two elements and gave higher concentration factors over samples of filtered shore-line sea water taken from the area. (EIS-Deal)

POLLUTION OF GROUNDWATER THROUGH NONLINEAR DIFFUSION,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Civil Engineering.
P. Basak, and V. V. N. Murty.
Journal of Hydrology, Vol. 38, No. 3/4, p 243-247, August 1978. 3 fig, 10 ref.

Descriptors: *Groundwater, *Water pollution, *Diffusion, Aquifers, Water pollution sources, Pollutants, Path of pollutants, Model studies, Mathematical models, Equations, Nonlinear diffusion.

An analytical solution for the prediction of the spread of contaminant caused by nonlinear diffusion in an aquifer adjoining a polluted source was presented. The solution was based on the assumption of the existence of a sharp diffusion front and was similar to the solution of a two-dimensional unsaturated flow problem. The effect of concentration dependency of the diffusion coefficient on the contamination spread was discussed. (Sims-ISWS)

STREAM TEMPERATURE ESTIMATION USING KALMAN FILTER,
Pittsburgh Univ., PA. Dept. of Civil Engineering.
C. L. Chiu, and E. O. Isu.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY9, Proceedings Paper 13991, p 1257-1268, September 1978. 4 fig, 16 ref, 2 append.

Descriptors: *Water temperature, *Streams, *Model studies, *Statistical methods, Mathematics, Equations, Stochastic processes, Systems analysis, Theoretical analysis, Mathematical models, Analytical techniques, Surface waters, Rivers, Regression analysis, Streamflow, Forecasting, Time series analysis, *Kalman filter.

The system model used combines the deterministic sinusoidal model with a simple stochastic (first-order autoregressive) model of the residuals from the actual temperature of the temperature estimation given by the sinusoidal model. The estimation and forecasting technique was tested for its capability to generate daily streamflow temperature between several different measurement intervals. Results with Kalman filter were compared with those obtained in the 4 parallel models (the sinusoidal, the sinusoidal coupled with either the first-order or second-order autoregressive modeling of the random deviations, and the sinusoidal coupled with first-order autoregressive-moving average modeling of the random deviations). The mean-square deviation of estimated or predicted temperatures from the actually observed was used to measure the relative accuacy of the estimations by the 5 different techniques. The results showed a definite advantage of using Kalman filter. (Humphreys-ISWS)

Journal of Hazardous Materials, Vol. 2, No. 3, p 219-225, 1977/1978. 3 tab, 7 ref.

Descriptors: *Adsorption, *Cadmium, *Toxins, *Solid wastes, *Leachate, Isotherms, Textiles, Anions, Cations, Solvents, Plastics, Sands, Aqueous solutions, Leaching, Arsenic compounds, Waste water treatment, Metals, Chemical wastes, Chemical industry, Industrial wastes.

Refuse components were capable of adsorbing significant quantities of inorganic cationic cadmium, inorganic anionic arsenate, and the halogenated solvent, trichloroethylene, when contacted for a sufficient period of time. A 1000 mg/liter sample of each toxic substance was mixed with an aqueous solution bearing 5000 vpm of acetic acid to represent leachate from a landfill or waste depository; sodium hydroxide was used to vary the pH over 3, 7, and 9. A 200 ml aliquot of the solution was contacted for 24 hrs at 30C with 10 g of unprinted newspaper, dacron/cotton material, polyethylene, and lower greensand, representing refuse components. The adsorption of arsenate

and cadmium by the refuse components generally conformed to a Langmuir isotherm with only several instances of observed reversible adsorption. The saturation concentrations in the absorbents ranged about 6,500-15,000 ppm cadmium and about 25-500 ppm arsenate; for both toxins, paper was the most efficient adsorbent, although some reversibility was observed. A Freundlich isotherm depicted the linear adsorption of trichloroethylene from solution onto the refuse components; the saturation concentration of the toxin ranged over 8,000-10,000 ppm (volume/wt) in polyethylene and textile. Saturation levels were lower with paper and with decreasing pH. The solution pH had a significant effect on the adsorption of arsenate and to a lesser extent on cadmium and trichloroethylene. OIL-TROUBLED WATER,
American Ground Water Consultants, Albuquerque, NM.
W. M. Turner.
Geotimes, Vol. 23, No. 9, p 21-22, September, 1978.

Descriptors: *Pollution abatement, *Groundwater movement, *Groundwater contamination, *Oil spills, Reclamation, Remote sensing, Organic compounds.

The International Association of Hydrogeologists held a symposium in Prague on June 4-6 which dealt with problems of ground-water contamination by oil spill in highly industrialized areas. The main themes of the symposium were: (1) methods of hydrogeologic exploration and decontamination of rock and ground water contaminated by oil; (2) movement of oil in ground water and rocks; (3) chemical relations in the rock-ground water-oil system; and (4) location and delimitation of contaminated rock and ground water by surface methods. Remote sensing methods to delineate areas contaminated by oil spills, and physical and biological methods of reclamation were among the 34 technical papers presented. Following the technical sessions, there were two field trips to spill sites where physical reclamation methods were being employed. At one site, large diameter wells were used to remove the hydrocarbon, while at the other site, deep trenches were used. (Purdin-NWWA)

LITERATURE REVIEW FOR EXPLORE-I: A RIVER BASIN WATER QUALITY MODEL. APPENDIX A,
Battelle Pacific Northwest Labs., Richland, WA.
A. Brandstetter, D. B. Cearlock, R. G. Baca, W. W. Waddel, and C. R. Cole.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 933, Price codes: A05 in paper copy, A01 in microfiche. Prepared for Environmental Protection Agency, Washington, DC, August 1973. 87 p, 8 fig, 2 tab, 117 ref.

Descriptors: *River basin development, *Project planning, *Water pollution, *Computer models, *Simulation analysis, *Water quality control, Biochemical oxygen demand, Hydrodynamics, Stratification, Hydraulic models, Reviews, Mathematical models, Benthos, Dissolved gases, Algae, Carbon, Oxygen, Toxicity, Equations, Systems analysis, Bibliographies.

Battelle-Northwest has developed a generalized, comprehensive mathematical water quality model, EXPLORE-I, for use in river basin planning and water resource studies. The model can predict the hydrodynamics and water quality dynamics for rivers, well-mixed estuaries, and thermally-stratified reservoirs. This computer model is an extended and modified version of the Storm Water Management Model (receiving-water component) which was developed for studies of DO/BOD dynamics. This appendix 'A' to the main report entitled, 'EXPLORED-I: A River Basin Water Quality Model', contains a comprehensive review of various water quality submodels, river and estuary hydrodynamic models, and deep reservoir hydrothermal models. The water quality submodels identified herein are the result of an extensive literature survey of over three-hundred seventy published articles and books. (See also W79-00187) (Bell-Cornell)

USER'S MANUAL FOR EXPLORE-I: A RIVER BASIN WATER QUALITY MODEL. APPENDIX B,
Battelle Pacific Northwest Labs., Richland, WA.
R. G. Baca, W. W. Waddel, C. R. Cole, A. Brandstetter, and D. B. Cearlock.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 934, Price codes: A06 in paper copy, A01 in microfiche. Prepared for Environmental Protection Agency, Washington, D.C., August 1973. 97 p, 16 fig, 15 tab, 6 ref.

Descriptors: *River basin development, *Water pollution, *Computer models, *Water quality control, *Simulation analysis, Computer programs, Streamflow, Waste disposal, Sewage treatment, Mathematical models, Hydraulics, Systems analysis.

Battelle-Northwest has developed a generalized, comprehensive mathematical water quality model, EXPLORE-I, for use in river basin planning and water resource studies. This computer model stimulates the dynamic hydraulic and water quality characteristics of a river basin to study the effects of various flow conditions, waste discharge, and treatment schemes on water quality levels; it can also be used to study lakes, reservoirs (thermally-stratified), and well-mixed estuaries. It is an extended and modified version of the Storm Water Management Model (receiving-water component) which was developed for studies of DO/BOD dynamics. This User's Manual, Appendix B provides the information needed for setting up and analyzing a river basin. Descriptions of the models and their use are also provided. (See also W79-00187) (Bell-Cornell)
W79-00189

PROGRAMMER'S MANUAL FOR EXPLORE-I: A RIVER BASIN WATER QUALITY. APPENDIX C,
Battelle Pacific Northwest Lab., Richland, WA.
R. G. Baca, W. W. Waddel, C. R. Cole, A. Brandstetter, and D. B. Cearlock.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 935, Price codes: A13 in paper copy, A01 in microfiche. Prepared for Environmental Protection Agency, Washington, D.C., August 1973. 283 p, 37 fig, 3 tab, 4 ref.

Descriptors: *River basin development, *Water pollution, *Computer models, *Water quality control, *Simulation analysis, Stratification, Hydraulic models, Coding, Flow charting, Manuals, Tables(Data), Subroutines, Systems analysis.

EXPLORE-I, the Battelle-Northwest water quality model, is a computer program which simulates the dynamic hydraulic and water quality characteristics of a river basin. It can be used to study the effects of various flow conditions, waste discharge, and treatment schemes on the water quality levels of lakes, reservoirs, streams, and rivers. This Programmer's Manual provides the basic programming requirements of the EXPLORE-I codes. Included are flow diagrams, variable definition tables, program listings, and brief descriptions of the main subroutines. Portions of this document are not fully legible. THE DETERMINATION OF QUANTITY AND QUALITY OF GREAT LAKES UNITED STATES SHORELINE ERODED MATERIAL,
Michigan Univ., Ann Arbor. Sea Grant Program.
E. Seibel, J. M. Armstrong, and C. L. Alexander.
International Reference Group on Great Lakes Pollution from Land Use Activities, September 1976. 46 fig, 27 tab, 137 ref, 2 append. GLBC 75D1 and EPA 68-01-1598.

Descriptors: *Great Lakes, *Erosion rates, *Sediments, *Water pollution sources, *Chemical analysis, *Shores, Lake Superior, Lake Michigan, Lake Huron, Lake Erie, Lake Ontario, Bluffs, Land use, International Joint Commission, Littoral, Waves(Water), Wind erosion, Recession rates, United States, Beach erosion, Weathering.

Annual volumetric contributions of sediment from the U.S. shoreline of the Great Lakes were estimated on the basis of shore recession rates for about 44% of the erodible shoreline, and chemical constituents of transported material were calculated. Estimates of total quantity and quality of eroded material will be included in a subsequent study. The following aspects are covered: (1) nearshore erosion processes, (2) methodology, (3) bluff recession, and (4) erosion and chemical input to the Great Lakes from the U.S. shoreline. Data clearly demonstrate that erosion varies among locations, and erosion and shore recession rates for any one point can vary significantly from average values for the particular shore form. Shore recession data were obtained from various sources, and a weighted average annual, maximum annual, and minimum annual recession rate were estimated for each section of the U.S. Great Lakes shoreline for which there were data. The volume of material contributed from bluff recession was determined using the rectangular prism method. High annual recession rates were found on shores of southwestern Lake Superior (exceeding three m), eastern Lake Michigan (over one m), southwestern Lake Huron, and western Lake Erie (over 1.5 m). (Lynch-Wisconsin)

WATER QUALITY IN THE OZARK NATIONAL SCENIC RIVERWAYS, MISSOURI,
Geological Survey, Rollo, MO. Water Resources Div.
J. H. Barks.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price $3.25. Water-Supply Paper 2048, 1978. 57 p, 8 fig, 2 plates, 20 tab, 34 ref.

Descriptors: *Water pollution sources, *National parks, *Wild rivers, *Recreation facilities, *Water analysis, Nutrients, Pesticides, Bacteria, Trace elements, Aquatic environment, Missouri, *Ozark National Scenic Riverways.

During an intensive water-quality study of the Ozark National Scenic Riverways in Missouri, dissolved-solids concentrations averaged 276 mg/liter in ground water and less than 200 mg/liter in springs and streams. Calcium, magnesium, and bicarbonate constituted more than 90 percent milliequivalents of the total ions in the waters. Total

itrate concentrations as nitrogen averaged 0.22 ng/liter in ground water, 0.42 mg/liter in springs, nd less than 0.65 mg/liter in streams. Minor-ele-nent concentrations were generally low, but on ne occasion there were anomalously high concen-rations of total barium, lead, silver, and zinc in amples from Blue Spring and four stream-index tations. The only pesticides detected were 0.03 nicrograms per liter of 2, 4-D and 0.03 micrograms er liter of 2, 4, 5-T in the Current River. Commu-nities and developed campgrounds exhibited no letectable influence on the quality of water in treams. However, concentrated swimming activi-ies caused slight increases in bacteria densities, nd concentrated horseback riding activities esulted in significant increases in fecal coliform nd fecal streptococcus densities in the Jacks Fork. Phytoplankton, periphyton, and benthic in-vertebrate types and populations in the Current River and Jacks Fork indicate generally unpolluted conditions. (Woodard-USGS)

GEOLOGY AND GROUND WATER IN DOOR COUNTY, WISCONSIN, WITH EMPHASIS ON CONTAMINATION POTENTIAL IN THE SILURIAN DOLOMITE,
Geological Survey, Madison, WI. Water Resources Div.
M. G. Sherrill.
Available from the Supt. of Documents, GPO, Washington, DC 20402, Price $4.75. Water-Supply Paper 2047, 1978. 38 p, 13 fig, 5 plates, 5 tab, 34 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Water quality, *Path of pollutants, *Aquifer characteristics, Groundwater availability, Water level fluctuations, Groundwater availability, Water level fluctuations, Groundwater recharge, Water wells, Water yield, Aquifer management, Water supply, Hydrologic data, Wisconsin, *Door County, *Silurian dolomite.

Door County, Wis., has a long history of groundwater contamination. The problem is most severe in late summer, when tourists and fruit-canning operations generate additional contaminants. Fecal organisms from ineffective waste-disposal systems are the major ground-water contaminants. Contaminants also enter the ground-water system from agricultural, industrial, and municipal sources. Most contaminated ground water is in populous areas that lack sewage-treatment facilities and that are underlain by fractured bedrock at or near the surface. This report describes the geology, ground water, hydrology, and groundwater quality in Door County to provide a better basis for planning future wells. Several geologic and hydrologic factors were considered and studied. Ten bedrock wells, ranging in depth from 47 to 1,845 ft were drilled and tested by the U.S. Geological Survey. The thicknesses of unconsolidated deposits and Silurian rocks were determined, and the areal extent of the Silurian dolomite aquifer system was outlined. Chemical and bacterial ground-water quality was monitored. Ground-water and contaminant movement were determined in selected areas, and this information was used to define areas of potential ground-water contamination. (Woodard-USGS)

FORMS OF TRACE ELEMENTS IN SOILS, SEDIMENTS, AND ASSOCIATED WATERS: AN OVERVIEW OF THEIR DETERMINATION AND BIOLOGICAL AVAILABILITY,
Geological Survey, Menlo Park, CA. Water Resources Div.
E. A. Jenne, and S. N. Luoma.
In: Biological Implications of Metals in the Environment: Proceedings of the Fifteenth Annual Manford Life Sciences Symposium at Richland, Washington, September 29-October 1, 1975, p 110-143, 1977. 1 fig, 2 tab, 187 ref.

Descriptors: *Trace elements, *Analytical techniques, *Surface waters, *Sediments, *Biota, *Biological communities, Aquatic populations, Geochemistry, Water temperature, Physicochemical properties, Heavy metals, Suspended solids, Organic matter, Soil chemistry, Water quality, Environment, Absorption, Solutes.

The particular physicochemical forms of trace elements in waters and sediments are of major importance in determining the biological availability of trace elements to biota. The thermodynamic activity of the uncomplexed ion is probably the single most important factor affecting the biological availability of solute trace elements. Most of the data showing a decrease in trace element assimilation, by freshwater organisms, with increasing waterhardness can be interpreted in terms of a decrease in activity of the element due to precipitation and to formation of carbonate, hydroxide, and other complexes. With some exceptions, complexation of solute trace elements by organic ligands also decreases their biological availability. Experimental evidence indicates that trace element assimilation from solid forms (sediment) by detritus ingesting aquatic orgnisms is dependent upon trace element form, but occurs much slower than the assimilation rate from solute forms. The biological importance of solid forms of trace elemets may be principally due to their regulation of equilibrium solute concentrations in the associated waters via sorption - desorption and dissolution - precipitation reactions.

SAMPLING AND MODELING OF NON-POINT SOURCES AT A COAL-FIRED UTILITY,
Research Corp. of New England, Wethersfield, CT.
G. T. Brookman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 369, Price codes: A13 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA-600/2-77-199, 268 p, Sept 1977. 11 fig, 35 tab, 4 app, 21 ref.

Descriptors: *Mathematical models, *Leachate, *Coals, *Runoff, Model studies, Statistical models, Water pollution sources, Fossil fuels, Powerplants, On-site data collections, Utilities, Electric powerplants, Streams, Path of pollutants, Air pollution, *Coal powerplants, Nonpoint sources.

The report gives results of a measurement and modeling program for non-point sources (NPS) from two coal-fired utility plants, and the impact of NPS on receiving waters. The field measurement survey included measurement of overland runoff from NPS and river sampling upstream and downstream of each plant site. NPS sampled from storm water runoff and leachate from coal storage piles and runoff from impervious areas such as parking lots and roofs which were covered with dust fallout from coal and ash handling operations. A mathematical model was developed to simulate both the quantity and quality of industrial NPS pollution and its impact on receiving waters. Field data indicated that NPS pollution from utilities had little impact on the two rivers, compared to the impact from sources upstream of each site. Modeled results compared to field measurements within a factor of 4 for both the quantity and quality of storm water runoff and its impact on the quality of the receiving waters. (EIS-Deal)

A FIRST ORDER MASS BALANCE MODEL FOR THE SOURCES DISTRIBUTION AND FATE OF PCBS IN THE ENVIRONMENT,
Versar, Inc., Springfield, VA.
F. C. Whitmore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 220, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA-560/6-77-006, July 1977. 158 p, 14 fig, 43 tab, 5 app, 39 ref. NTIS PB-270 220.

Descriptors: *Polychlorinated biphenyls, *Great Lakes, *Lake Michigan, *Mathematical models, Path of pollutants, Water pollution sources, Lakes, Model studies, Statistical models, Sediments, Air pollution, Water chemistry, Water analysis, Aroclors, Chemical properties, *Bioaccumulation.

A first order model for the sources, distribution and fate of PCBs in an aquatic system is described. The model is then applied to Lake Michigan and to the Great Lakes System. The results obtained from the model indicate that atmospheric sources are a major PCB input to the Great Lakes. Because of the great water mass of the lakes, the PCB concentration appears to be storage controlled rather than loss controlled. The major loss mechansims are found to be co-evaporation from the air-water surface interface and entrapment with sediments. It is estimated that if all inputs of PCBs rate in Lake Michigan were eliminated, it would take more than 70 years for the concentration of PCBs in the water to decrease by 50 per cent. (EIS-Deal)

MULTIMEDIA LEVELS--MERCURY,
Battelle Columbus Lab., Columbus, OH.
V. J. DeCarlo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 201, Price codes: A07 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA-560/6-77-031, September 1977. 150 p, 18 fig, 47 tab, 220 ref.

Descriptors: *Mercury, Path of pollutants, Chemical analysis, Water analysis, Public health, Human pathology, Industrial wastes, Water pollution sources, Air pollution, Food habits, Food chains, Food webs, Fish physiology, Heavy metals, Geothermal studies, *Tissue analysis, *Bioaccumulation, Environmental levels.

This report is a review of environmental levels of mercury based on published reported and other information sources. Mercury levels are reported for the atmosphere, surface, and ground waters, drinking water, sediments, soils, terrestrial and

aquatic biota and man. The behavior of mercury in the environment is also discussed. Higher than ambient levels of mercury are found near mercury mines, geothermal steam fields, power plants, incinerators, sewage treatment plants, some industralized areas, and indoors where mercury is used. The release of mercury from natural sources to air and water is double the man-related losses to these media. The levels of mercury in biota are variable, depending on food habits and environmental conditions. The highest levels occur in animals at the top of the trophic structure. Mercury levels in tissues of humans are elevated in chlor-alkali industry workers, in dentists, in people from areas with natural mercury deposits, and in urban populations as compared with the rural. LONGITUDINAL DISPERSION OF FLUID PARTICLES IN MOUNTAIN STREAMS: I. THEORY AND FIELD EVIDENCE,
Geological Survey of Canada, Ottawa (Ontario).
T. J. Day.
Journal of Hydrology (New Zealand), Vol. 16, No. 1, p 7-28, 1977. 9 fig, 4 tab, 30 ref.

Descriptors: *Dispersion, *Streams, *Mountains, Streamflow, On-site investigations, Tracers, Salts, Sodium chloride, Mixing, Model studies, Theoretical analysis, Analytical techniques, Rivers, Hydraulics, Hydrology, Mountain streams, Lognitudinal dispersion.

The longitudinal dispersion of fluid particles in mountain streams was investigated in a series of 49 experiments. Mean properties of the dispersion process were studied over a maximum downstream distance of 2,250 m, a mean velocity range of 0.32-1.57 m/s, and a mean flow width range of 2.7-21.8 m. It was shown conclusively that for distances of up to 800 mean channel widths in these steep, turbulent streams, the spread of standard deviation of an initially concentrated mass increases linearly with distance, and not as its square root as necessary for the application of conventional mixing models. Consequences of this linearity are an ever-increasing dispersion coefficient along the channel and a persistent asymmetrical concentration distribution. (See also W79-00309) (Sims-ISWS)
W79-00308

LONGITUDINAL DISPERSION OF FLUID PARTICLES IN MOUNTAIN STREAMS: 2. SIMILARITY OF THE MEAN MOTION AND ITS APPLICATION,
Geological Survey of Canada, Ottawa (Ontario).
T. J. Day.
Journal of Hydrology (New Zealand), Vol. 16, No. 1, p 26-52, 1977. 24 fig, 2 tab, 5 ref, 1 append.

Descriptors: *Dispersion, *Streams, *Mountains, Streamflow, Mixing, On-site investigations, Tracers, Salts, Sodium chloride, Data processing, Model studies, Analytical techniques, Rivers, Hydraulics, Hydrology, Mountain streams, Longitudinal dispersion.

The mean longitudinal motion of fluid particles dispersing in mountain streams was shown, for distances up to 800 mean channel widths, to exhibit the characteristics of a self-similar process with constant velocity ratios and geometric form. Although the kinematic relations and the structure of the turbulent field were shown to be sensitive to the nature of the flow boundaries and the geometry of the channel, similarity was shown to exist for flows in a wide range of steep gravel- and boulder-bed channels. A dimensionless time-concentration curve was developed, and a method for prediction of the dispersion pattern, based upon the co-ordinates of this shape and the linearity of its scaling parameters, was presented. MASS BALANCE MODEL FOR CALCULATION OF IONIC INPUT LOADS IN ATMOSPHERIC FALLOUT AND DISCHARGE FROM A MOUNTAINOUS BASIN,
British Columbia Univ., Vancouver. Dept. of Geography.
L. J. Zeman, and O. Slaymaker.
Hydrological Sciences Bulletin, Vol. 23, No. 1, p 103-117, March 1978. 2 fig, 4 tab, 29 ref.

Descriptors: *Watersheds(Basins), *Fallout, *Canada, *Model studies, *Precipitation(Atmospheric), Ions, Cations, Discharge(Water), Mountain forests, Data collections, On-site investigations, Mountains, Surface waters, Chemical analysis, Water pollution, Statistical methods, Data processing, Sodium, Potassium, Calcium, Magnesium, Bicarbonates, Sulfates, Phosphates, Hydrogen ion concentration, *British Columbia, Mass balance, Pristine forests.

A mass balance model was designed to determine the contribution of ionic loads in atmospheric fallout to discharge from a pristine forested mountainous basin in British Columbia. Input to the model consisted of measurements of weekly precipitation amounts (mm) and ionic concentrations (mg/l) in bulk fallout on 4 elevation zones of an experimental basin. Output data consisted of instantaneous hydrometric measurements, expressed in flow units per basin area (mm) and ionic concentrations (mg/l) measured in weekly intervals at the basin outlet. The weekly data on volume weighted ionic concentrations in bulk fallout and discharge were used for calculation of monthly ionic loads (kg/ha/month) and their monthly input-output balances. The annual loads (kg/ha/yr) in bulk fallout and discharge as well as the annual input-output balance were determined from the monthly loads. Implication of the hydrochemical balance for precipitation and stream chemistry variations, weathering, erosion, and denudation rates in a perhumid moutainous basin in coastal British Columbia was discussed. The model is sufficiently general in its design to be used for the assessment of hydrochemical input-output budgets in any moutainous basin unit. Its applicability is particularly evident for systems in which classical dissolved solids concentration-discharge relationships are highly variable over space and time. (Humphreys-ISWS)

MODELING AND MONITORING OF TOXIC SPILLS AND TOXIC EFFLUENTS,
Research Corp. of New England, Wethersfield, CT.
R. E. Kenson.
Available from Copyright Clearance, Inc., New York, NY as 0065-8812-78-9861-0178 ($0.95). In: Water -- 1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 1-5, 1978, 3 fig, 2 tab, 4 ref.

Descriptors: *Water pollution, *Toxicity, *Effluents, *Monitoring, *Model studies, *Pollutant identification, Analytical techniques, Pollutants, Mass spectrometry, Gas chromatography, Colorimetry, Absorption spectroscopy, Absorption, High pressure liquid chromatography.

Various approaches to solving practical water pollution problems are evaluated with emphasis on monitoring and modeling of toxic effluents. Definition of the problem is the first, most important, step before deciding on the course of action to be pursued. This is recommended even in crisis situations where immediate action is being demanded. Monitoring techniques which aid in defining a toxic pollutant problem include: gas chromatography/mass spectroscopy which has proved effective for most volatile organic pollutants; atomic absorption which is used for metals after they have been chelated and extracted from solution; and colorimetric analysis and specific ion electrode methods which may be preferred for specific chemicals, such as fluorides, phenols, and cyanides. Caution is advised in using gas chromatographic methods along without corroboration because it can be misleading. For components of low volatility, the use of high pressure liquid chromatography is recommended as an attractive alternative. Predictive mathematical modelling techniques are described as an effective supplement to sampling/analysis but caution is advised here, too. Factors that should be considered in evaluating a modelling study are: (1) accuracy of the volume and release rate data of the pollutant; (2) solubility and specific gravity of the toxic pollutant; (3) validity of the model for application. MODELLING THE WATER QUALITY OF THE HYDROLOGICAL CYCLE.
Proceedings of the Baden Symposium, September 1978, convened jointly by IIASA and IAHS. IAHS-AISH Publication No. 125, Office of Treasurer, IAHS, 1909 K Street NW, Washington, DC., 1978. (383 p,) 155 fig, 48 tab, 397 ref.

Descriptors: *Water quality, *Mathematical models, *Water management(Applied), *Optimization, *Simulation analysis, *Analytical techniques, *Hydrologic cycle, Rivers, Lake, Reservoirs, Estuaries, Economic efficiency, Systems analysis, Equations, Hydraulics.

Important progress has been made in recent years in the application of systems methodology to modeling the quality of water in the hydrological cycle. Many papers on these problems have been presented at various international symposia and seminars, such as those held in Warsaw (1971), Bratislava (1975), and Amsterdam (1977. Hydrophysical and ecological modeling of water bodies, as well as a survey on water quality modeling, are part of the research program of the International Institute for Applied Systems Analysis (IIASA) in Laxenburg, Austria. Modelling the Water Quality of the Hydrological Cycle is the proceedings of an international symposium convened jointly by IIASA and IAHS (The International Association of Hydrological Sciences), due to the increasing interest in this subject. Held in Baden, Austria during September of 1978, over 30 papers were delivered, covering the following fields: (1) modeling water quality processes in rivers and estuaries; (2) modeling water quality processes in lakes and reservoirs; 83) modeling groundwater quality processes; and (4) water quality management. Numerous physical simulation modeling techniques and economic optimization methods are presented. Dealt with are such problems as those concerning waste water treatment, activated sludge, water quality control, inter-basin transfer, water networks, water resources development, streamflow forecasting, mocropollutant transport, two-dimensional mixing, eutrophication, shallow water bodies.

STORMWATER MODELING,
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
D. E. Overton, and M. E. Meadows.
Academic Press, New York, N.Y., 1976. 358 p, 171 fig, 66 tab, 203 ref, append.

Descriptors: *Storm water, *Model studies, *Analytical techniques, *Parametric hydrology, *Stochastic processes, *Water pollution, *Kinetics, *Deterministic modeling, Rainfall, Overland flow, Open channel flow, Estimating, Regional analysis, Effects, Urbanization, Evaluation, Estimating, Simulation analysis, Optimization, Sensitivity analysis, Wave theory, Equations, Systems analysis.

Presented are the fundamentals of deterministic, parametric, and stochastic stormwater modeling for those having a basic background in science or engineering. The book was written for an audience concerned primarily with evaluating the effects of land use on stormwater for the purpose of doing feasibility studies, planning, and/or design work. A view is given of present methodologies with illustrative examples. The book considers both quantity and quality, but the focus is mainly on stormwater pollution, and so it is stressed that the transport mechanism for water pollutants is the water itself. After an introduction and discussion of modeling concepts, the section on deterministic modeling considers such aspects as rainfall excess, overland and open channel flow, and kinematic flow approximation and wave theory. Discussed next, under parametric modeling, are model optimization techniques, sensitivity analysis, and the evaluation of effects of urbanization and logging on stormwater and of strip mining on streamflow. The stochastic section deals with stormwater frequency modeling. Discussed finally, under stormwater quality modeling, are the state of the art in stormwater quality modeling, simulating pollutographs and loadographs, and the development of stormwater quality indices. (Bell-Cornell)

TRANSPORT CHARACTERISTICS OF PHOSPHORUS IN CHANNELIZED AND MEANDERING STREAMS,
Everglades National Park, Homestead, FL.
P. C. Rosendahl, and T. D. Waite.
Water Resources Bulletin, Vol. 14, No. 5, p 1227-1238, October 1978. 4 fig, 1 tab, 7 equ, 20 ref.

Descriptors: *Nutrients, *Mathematical models, *Water quality, *Orthophosphate, *Channelization, *Meandering streams, *Kissimmee River Basin(Fla), Equations, Movement, Canals, Runoff, Effects, Numerical techniques, Mathematical transport model, Steady state, Simulation analysis.

Comparisons were made between rates of movement of orthophosphate in a canal and a meandering stream. The meander system had greater algal and macrophyte phosphate uptake rates and lower plankton and sediment release rates compared to the canal. Chemical precipitation and direct rainfall influence on orthophosphate movement were insignificant relative to other terms. The major source of phosphorus to both systems was from upland runoff. The impact of this source was greater on the meandering system due to the smaller channel volume. When secondary effects of meandering were considered such as marsh inundation, the net orthophosphate movement within the meandering channel was less than that for the canel, due to the lower concentrations of phosphorus in marsh effluent waters. Field experiments were conducted to compare the longitudinal dispersion coefficient between a canal and meandering river system; the meandering stream had a dispersion coefficient over 17 times that measured for the canal. Rates of orthophosphate movement were combined into a single mass transport equation, and a numerical solution was obtained. Internal river and canal channel processes were overshadowed by external point source loadings. (Bell-Cornell)

A WATER QUALITY MODEL FOR THE SOUTH PLATTE RIVER BASIN, DOCUMENTATION REPORT,
Battelle Pacific Northwest Labs., Richland, WA.
W. W. Waddel, C. R. Cole, and R. G. Baca.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 923, Price codes: A05 in paper copy, A01 in microfiche. Prepared for Environmental Protection Agency, Washington, D.C., Office of Research and Monitoring, April 1974. 87 p, 62 fig, 10 tab, 10 ref, append.

Descriptors: *Water quality control, *Simulation analysis, *Computer models, *Behavior, *Water pollution sources, *South Platte River Basin(Colorado), Phosphorus, Coliform bacteria, Nitrogen, Biochemical oxygen demand, Algae, Dissolved, Prediction, Dissolved gases, Streamflow, Regression analysis, Winter, Data.

The water quality model PIONEER-I is a steady-state program that simulates the behavior of the following water quality parameters: total nitrogen, total dissolved solids, zinc, dissolved oxygen, carbonaceous biochemical oxygen demand, fecal coliform bacteria, phosphorus, ammonia, nitrite, nitrate, and chlorophyll a. The model was set up on the entire length of the South Platte River from Eleven Mile Canyon Reservoir to its confluence with the North Platte River. In addition, ten major tributaries to the South Platte and a number of smaller streams were modeled. The model was calibrated using flow and water quality data collected on the river in late summer 1971 and winter 1971-72. The model was successfully calibrated to describe dissolved oxygen-biochemical oxygen demand mechanisms and nutrient distributions. Study results have shown that it is practicable to set up and calibrate a mathematical water quality model which considers numerous interactive constituents on a large and complex river basin such as the South Platte. It is recommended that every effort be made to encourage the use of this model by regional and local agencies and groups; it is only through this kind of repeated and continuous use that the model can be refined and developed into a reliable and trusted tool for water resource managers. (Bell-Cornell)

CHARACTERIZATION OF THE RELEASE OF CHRYSOTILE ASBESTOS FROM ASBESTOS-CEMENT DRINKING WATER PIPE,
Illinois Univ. at the Medical Center, Chicago.
W. H. Hallenbeck, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 087, Price codes: A04 in paper copy, A01 in microfiche. PhD Dissertation, 1977. 49 p, 2 fig, 15 tab, 47 ref. OWRT A-071-ILL(3).

Descriptors: *Asbestos cement, *Potable water, *Pipes, Sampling, *Asbestos, Electron microscopy, Lake Michigan, Illinois, Filtration, Water pollution sources, On-site investigations, *Chrysotile, Chicago.

A significant problem in data analysis involved the determination of the distribution of counts of asbestos fibers on a membrane filter. The elucidation of this distribution as Poisson enabled the parametric statistical comparison of 'before' to 'after' water samples. Under the conditions and limitations of this research, no significant release of chrysoltile from asbestos-cement pipe was observed. Preliminary data indicate that drinking water in northeast Illinois may contain chrysotile asbestos ranging from 30,000 to 700,000 fibers per liter.

INFLUENCE OF NITROGEN FERTILIZATION ON THE QUALITY AND QUANTITY OF STREAMFLOW FROM A FORESTED WATERSHED,
Kentucky University, Lexington, Water Resources Research Institute.
G. B. Coltharp, M. T. Shearer, E. P. Springer, and R. F. Wittwer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 171, Price codes: A04 in paper copy, A01 in microfiche. Research Report No. 115, 1978. 67 p, 13 fig, 14 tab, 27 ref. OWRT A-058-KY(1), 14-31-0001-5017 FY 75, 14-34-0001-6018 Fy 76, 14-34-0001-7038 FY 76T, 14-34-0001-7038 FY 77.

Descriptors: *Water quality, Fertilization, *Nutrient cycling, *Nitrate nitrogen flux, Streamflow, *Forest watersheds, Watershed management.

This project was designed to determine the effects of nitrogen fertilization on the quality and quantity of streamflow eminating from an eastern hardwood forest watershed. A 40.67 ha watershed, located in mountainous eastern Kentucky, was aerially fertilized in late April 1975. The forest stand was principally oak, hickory, and yellow poplar, 50-55 years of age in a relatively undisturbed condition. A helicopter applied ammonium nitrate at a rate of 504 kg/ha. Because a large part of applied nitrogen fertilizer ends up in the highly mobile nitrate nitrogen form, this is the principal ion monitored in this study. No effort was made to avoid live streams during application and, consequently, very high levels of nitrate nitrogen were detected (640 mg/l) in streamflow within the watershed. Levels potentially toxic to humans and animals persisted in the streamflow for several days following application. Although elevated concentrations of nitrate nitrogen persisted in streamflow leaving the watershed over a

two year period no algal blooms or excessive growth of aquatic plants were noted. Rather high concentrations of nitrate nitrogen were found in the soils of the watershed, with greatest concentrations in the surface layer (0-5cm), intermediate amounts at 15-20cm, and the lowest concentrations at the 41-46cm depth. The effects of the fertilizer application on soils persisted less than one year in the 0-46cm depth sampled. Analysis of streamflow records indicated a reduction in water yield the first and second growing seasons after treatment.

FACTORS AFFECTING THE QUALITY OF URBAN RUNOFF IN FOUR WATERSHEDS WITHIN THE CITY OF KNOXVILLE, TENNESSEE,
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
R. S. Brown.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 148, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, June, 1977. 84 p, 14 tab, 10 ref. OWRT A-046-TENN(1), 14-34-0001-7090.

Descriptors: *Urban runoff, Watersheds(Basins), *Water quality, *Urban watersheds, Knoxville(Tenn), *Tennessee, Path of pollutants, Third Creek/watershed, Runoff, *Stormwater.

Results of the analysis of 5 years of stormwater data from 4 urban watersheds indicated that there are two distinct but overlapping groups of contaminants. One group is the minerals and solids which have relatively constant concentrations from storm to storm and heavy metals, nutrients and COD which have decreasing concentration with increasing runoff. Removal is a function of runoff volume and only mildly affected by runoff rate. Pervious areas should not be disregarded in stormwater quality simulation. Hence street surface contaminant models will yield conservative results. It was also found that dustfall (total atmospheric fallout) could account for most of the stormwater pollution.
W79-00456

LEACHING CHARACTERISTICS OF VARIOUS HEAVY METALS, NON-HEAVY METALS AND ANIONS FROM MUNICIPAL SEWAGE SLUDGE ASH,
Connecticut Univ., Storrs.
C. D. Sweeney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 086, Price codes: A07 in paper copy, A01 in microfiche. M.S. Thesis, 1978. 128 p, 38 fig, 18 tab, 10 append, 59 ref. OWRT A-067-CONN(1). 14-34-0001-8007.

Descriptors: *Municipal wastes, *Incineration, *Sludge disposal, *Lagoons, *Leaching, *Heavy metals, *Anions, Chemical properties, Soil contamination, Groundwater, Water pollution sources, *Municipal sewage sludge incinerator ash, *Leaching characteristics, *Landfills, Batch studies, *Lysimeter studies, pH variation.

Qualitative and quantitative leaching characteristics of unquenched municipal sewage sludge incinerator ash were studied with respect to amount of water applied and pH variation. Chemical digestion by wet decomposition of unquenched ash showed high residual concentrations of magnesium, sodium, calcium and potassium. Iron was contained in the highest residual concentration of all heavy metals monitored, with zinc second and chromium, cobalt, copper, manganese, nickel and lead present in lower concentrations. Batch and lysimeter studies were used to examine the eluting of the above cations out of the ash and into the water. In addition sulfur, nitrate and chloride were monitored with sulfate having the highest concentrations. Lysimeter effluent analysis revealed basically similar types of 'immediate washing out' curves for both cations and anions with the exception of calcium, which remained in relatively higher concentrations for a longer period of time before its concentration declined. There were no major secondary peaks in any of the effluent profiles. Batch results paralleled lysimeter results with respect to changes in characteristic effluent concentrations. In addition, batch studies gave indirect information on the ability of the ash to buffer an initially acid effluent.

TOTAL PHOSPHORUS TRANSPORT DURING STORM EVENTS,
West Virginia Univ., Morgantown. Dept. of Chemical Engineering.
F. H. Verhoff, and D. A. Melfi.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 104, No. EE5, Technical Note, p 1021-1026, October 1978. 3 fig, 3 ref.

Descriptors: *River flow, *Phosphorus, *Water chemistry, *Model studies, Mathematical models, Flow, Flow rates, Chemicals, Pollutants, Path of pollutants, Water pollution, Storms, Storm runoff, Rivers, Hydrographs, Chemical concentrations.

The flow of water and total phosphorus was simulated in a stream with different types of total phosphorus transport mechanisms. The results of the simulations were compared with known properties of observed hydrographs and chemographs. It was concluded that the major mechanism required to explain the observed results is one that postulates the resuspension and deposition of total phosphorus from the reaches of the river. Thus, most of the total phosphorus moves through a river reach by moving a finite distance with each high flow event passing through the river. (Sims-ISWS)

SIMPLE MODEL FOR OCEAN OUTFALL PLUMES,
General Dynamics Corp., Pomona, CA.
H. C. Schau.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 104, No. EE5, Technical Note, p 1026-1031, October 1978. 3 fig, 8 ref, 1 append.

Descriptors: *Outfall sewers, *Sewage disposal, *Oceans, *Mathematical models, Jets, Outlets, Theoretical analysis, Model studies, Buoyancy, Mixing, Distribution patterns, Spatial distribution, *Outfall plumes.

Ocean outfall systems provide many coastal communities with an economical means of sewage disposal that requires only primary sewage treatment. It is desired to have the effluent as dilute as possible when it reaches the surface. It is known that the amount of mixing is generally affected by the mass flow rate at the outfall system exit, depth, and upward velocity of the effluent (that is a function of exit velocity and density stratification in the seawater). It was the desire of this study to provide some working functional relationships between these parameters in the prediction of dilution in an ocean outfall system. The study centered around a model which assumes that the entrainment is uniquely related to the local excess momentum flux. It was shown that a power law model provides a simple technique for predicting the dilution as a function of depth, for depths characteristic of most outfall systems (20 ft to 200 ft). In particular, it was found that for depths greater than 20 ft, the dilution varies as the 5/3 power of the depth and initial mass flow rate has to first order an additive effect to the solutions given for m sub o = 0. Such solutions are accurate to better than 5% on the average and are meant to augment the results of Fan and Brooks and to provide the working engineer with a simple method for performing preliminary studies without elaborate numerical or graphical solutions. RELATIONSHIP OF RAINFALL AND LAKE GROUNDWATER SEEPAGE,
McGill Univ., Montreal (Quebec). Dept. of Biology.
J. A. Downing, and J. J. Peterka.
Limnology and Oceanography, Vol. 23, No. 4, p 821-825, July 1978. 1 fig, 1 tab, 9 ref.

Descriptors: *Rainfall, *Lakes, *Groundwater movement, *Seepage, Nutrients, Nitrogen, Nitrogen compounds, Phosphorus, Phosphorus compounds, Groundwater, Recharge, Groundwater recharge, Natural recharge, Specific conductivity, Chlorides, Alkalinity, Sampling, Surveys, Chemical analysis, Limnology, Groundwater inflow.

Correlations were found between mean daily rainfall and groundwater inflow rate and between the rate of groundwater inflow and N and P inflow to a senescent lake during summer. A simple method of collecting and measuring groundwater inflow was reproducible at very low inflow rates. The water collected by this method was similar in P concentration to groundwater, but higher in N concentration. (Sims-ISWS)

CONTINUOUS SIMULATION OF NONPOINT POLLUTION,
Ramlit Associates, Berkeley, CA.
Y. J. Litwin, and A. S. Donigian, Jr.
Journal Water Pollution Control Federation, Vol. 50, No. 10, p 2348-2361, October 1978. 9 fig, 26 ref.

Descriptors: *Water pollution, *Water pollution sources, *Sediments, *Model studies, Mathematical models, Simulation analysis, Computer models, Land use, Planning, Runoff, Water quality, Pollutants, Path of pollutants, Analytical techniques, *Nonpoint pollution, Nonpoint water pollution sources.

Accurate information about the characteristics and the magnitude of nonpoint pollution sources is difficult to establish because (1) pollution varies by orders of magnitude from one watershed to another and from one storm to the next; (2) quantitative information about nonpoint pollution is scarce; and (3) the reported surveys are often incompatible in sampling procedures, analytical techniques, and measured parameters. This paper reviewed briefly the various modeling techniques available for the assessment of nonpoint pollution and discussed their limitations as analytical tools. The recently developed Nonpoint Source Pollutant Loading (NPS) Model was presented. It is based on continuous simulation of hydrologic processes and mechanisms of pollutant accumulation, generation, and transport from the land surface. (Sims-ISWS)

NUTRIENT LOADING/LAKE TROPHIC CONDITION RELATIONSHIPS WITH SPECIAL REFERENCE TO THE INFLUENCE OF FLUSHING RATE,
Maine Univ. at Orono.
M. L. Hutchins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 644, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, May 1977. 93 p, 24 fig, 2 tab, 44 ref, 7 append. C-7232(6230)(1). 14-34-0001-6230.

Descriptors: Biomass, Chlorophyll, Lakes, *Phosphorus, Secchi disks, Washouts, *Trophic level, *Model studies, *Eutrophication, Water pollution effects, Algal growth kinetics, *Flushing rate, *Nutrient loading, *Trophic state models.

A nutrient loading/lake trophic state model was developed into which algal growth kinetics were incorporated. Contrary to many past lake modeling efforts, this work described in-lake biomass concentrations instead of in-lake total phosphorus concentrations. The use of growth kinetics allowed flushing rate to become an important parameter for defining lake trophic state. For a given volumetric phosphorus loading, a critical flushing rate was identified beyond which lake washout was predicted to occur. For a phosphorus input concentration of 0.010 g/m3, washout was predicted to occur at a flushing rate of about 45 year-1. The exact value of critical flushing rate was influenced by the values of the kinetic parameters, the maximum specific growth rate, and the half-saturation constant. At low flushing rates both lake biomass and in-lake total phosphorus could be used equally well as indicators of lake trophic state. At high flushing rates, however, biomass was found to deviate substantially from total phosphorus; thus biomass was more representative of lake trophic state than was total phosphorus. Because of this, it is anticipated that biomass will provide a better correlation between secchi disc and chlorophyll a. In application, the model defines actual lake trophic state equally as well as some previous models and, in addition, it has the capacity to describe lake washout conditions.

EFFECTS OF MUNICIPAL SEWAGE EFFLUENT IRRIGATION ON THE TRACE METAL CONTENT OF EARTHWORMS,
State Univ. of New York at Syracuse. Coll. of Environmental Science and Forestry.
J-P. Moreau.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 596, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, April 1977. 76 p, 9 fig, 3 tab, 78 ref, 9 append. OWRT B-048-NY(3).

Descriptors: *Waste water irrigation, Effects, *Earthworms, *Trace metals, Effluents, Municipal wastes, Soil organisms, Soil profile, Research, Projects, Evaluation, Ecosystems, Biological systems, Food chains.

Specific study objectives include: (1) to determine the effect of wastewater irrigation on the concentration of trace metals (Cd, Cu, Pb, Zn) in earthworms collected from three different habitats--an old field community, a reed canary grass field, and a mixed oak hardwood forest; and (2) to determine the effect of wastewater irrigation on the ratio of organic carbon to nitrogen in the soils of the three different vegetative habitats. Spray-irrigation of treated municipal wastewater is a viable alternate method of disposal. Recent investigations at Pennsylvania State University have shown that effluent irrigation increased populations of earthworms while suppressing populations of other soil organisms. On irrigated sites, earthworms may be performing a vital role in the decomposition of organic matter in the soil profile. Therefore, the assessment of any toxicological problems detrimental to this group of animals is of major importance. Examined herein is the effect of trace metals contained in the applied sewage effluent and the resultant metal content of the earthworms.

THE EFFECTS OF HEAVY METALS ON ALGAE POPULATIONS IN A SOUTH CENTRAL RESERVOIR,
Arkansas Univ., Fayetteville. Dept. of Botany and Bacteriology.
R. L. Meyer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 835, Price codes: A06 in paper copy, A01 in microfiche. Arkansas Water Resources Research Center, Fayetteville, Completion Report, Pub No 61, 1978. 90 p, 3 tab, 33 fig, 79 ref. OWRT A-041-ARK(1).

Descriptors: *Heavy metals, *Algae, Reservoirs, *Seasonal, Lakes, *Arkansas, *Lake Fayetteville(Ark), *Trace elements, Iron, Manganese, Cobalt, Copper, Lead, Zinc, Nutrients, Systematics, Water pollution effects.

This investigation examines seasonal variations of algal assemblages in Lake Fayetteville, in an attempt to evaluate the role of various trace elements in relation to these seasonal variations. Iron, manganese, cobalt, copper, lead, and zinc concentrations were evaluated from March, 1976 to March, 1977 with concomitant examination of algal assemblages. Also, correlations between specific taxa and metals in the water fraction were evaluated. A detailed literature review dealing with the role of micronutrients in various algal groups has been discussed, further evaluation and amplification of data and additional physicochemical parameters, are presented.

ACUTE AND CHRONIC ORAL TOXICITY OF CHLROINATED DIBENZOFURANS TO SALMONID FISHES,
Fisheries and Marine Service, St. Andrews (New Brunswick). Biological Station.
V. Zitko, D. J. Wildish, O, Hutzinger, and P. M. K. Choi.
Environmental Health Perspectives, Experimental Issue, No. 5, p 187-189, 1973. 2 fig, 3 tab, 5 ref.

Descriptors: *Toxicity, *Mortality, *Atlantic salmon, *Brook trout, Juvenile growth stage, Orgaic compounds, Polychlorinated biphenyls, Aroclors, Fish physiology, Path of pollutants, Chemical properties, Gas chromatograhy, *Dibenzofurans, *Tissue analysis, Bioaccumulation, *Toxicity testing.

A median mortality of 120 + or - 30 days occurred among juvenile Atlantic salmon, fed dry fish food containing 2.7, 5.7, 2.8, and 9.1 Microg/g wet weight of 2,8-di-, tri-, tetra- and octachlorodibenzofuran respectively. Only octachlorodibenzofuran was detected in the dead fish. The fate of the lower chlorinated dibenzofurans was not known and additional experiments, described in this paper, were carried out with immature brook trout fed relatively high levels of 2,8-dichlorobenzofuran. (EIS-Deal)

THE TOXICITY OF MANGANESE ETHYLENEBISDITHICCARBAMATE TO THE ADULT NEWT, TRITURUS CRISTATUS,
Milan Univ. (Italy). Lab. di Zoologia.
N. P. Zaffaroni, E. Arias, G. Capodanno, and T. Zavanella.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p 261-267, 1978. 3 fig, 1 tab, 6 ref.

Descriptors: *Toxicity, *Newts, *Fungicides, Organic compounds, Chemical properties, Path of pollutants, Amphibians, Animal pathology, Animal physiology, Animal metabolism, Respiration, Cytological studies, Mortality, Biological membranes, *Tissue analysis, Manganese ethyledisdithiocarbamate, Mameb.

The toxicity of ethylenebisdithiocarbamate (maneb), a widely used agricultural fungicide, to the adult newt was evaluated after percutaneous exposure. Maneb was lethal to all the animals at the 50 ppm level within fifteen days. Male newts seem to be less resistant to the toxicant than females. At concentrations as low as 25 ppm all males died within 25 days, whereas some of the females were still alive after 5 months. Microscopic examination showed that the skin and the kidney were the most severely affected organs. It has been hypothesized that an osmoregulatory breakdown and an impairment of cutaneous respiratory exchanges play a role in the death of the animals. Renal failure must also be taken in account. However, additional mechanisms can not be ruled out at present. (EIS-Deal)

Because of the relatively low toxicity of captan to crab stages and its high rate of degradation in seawater, it is suggested that the agricultural application of captan near marine waters is not likely to affect natural crab populations or crabs in laboratory culture. Furthermore, the prophylactic use of captan as a fungicidal treatment for Lagenidium sp. in larval crab cultures is considered safe when used at recommended dosages. (EIS-Deal)

Polish Academy of Sciences, Poznan (Poland). Inst. of Applied Zoology.
S. Kornobis.
Polskie Archiwum Hydrobiologii, Vol. 24, No. 4, p 531-545, 1977. 7 fig, 4 tab, 22 ref.

Descriptors: *Mollusks, *Heated water, *Animal populations, Ecology, Lakes, Population, Biological communities, Water pollution effects, Water temperature, Plankton, Larvae, Larval growth stage, Growth rates, Animal physiology, Trophic level, Biomass, *Thermal pollution, *Dreissena.

Investigations on the ecology of Dreissena polymorpha were carried on from 1973 to 1975 on a complex of heated lakes situated in the neighborhood of Konin in Wielkopolska. It was found that the population from heated lakes shows many changes in relation to the ordinary ones. The main differences are: shallow occurrence of the population in the heated lakes; prolongation of larvae occurrence in the plankton; distinct differentiation of the growth rate of the sedentary specimens in relation to the occurrence site; and in the shortening of life of sedentary specimens. Some fragmentary observations concerning the role of D. polymorpha in trophic relations in the heated lakes are also presented. (EIS-Deal)

Experiments with a closed system show that naphthalene has a deleterious effect on Parhyale at a concentration beginning at 3 ppm, at which most of the animals recovered. Much higher levels of naphthalene (2 or 3x) were required to kill Parhyale in open vessels compared with closed containers for a 24h exposure. A persistent damaging effect was found in some of the survivors from both open and closed systems, this effect appeared at much lower concentrations among the survivors from the closed vessels. Under natural conditions these debilitated animals would be vulnerable because they could not move about or feed. (EIS-Deal)

GROWTH AND DIETS OF TROUT FROM CONTRASTING ENVIRONMENTS IN A GEOTHERMALLY HEATED STREAM: THE FIREHOLE RIVER OF YELLOWSTONE NATIONAL PARK,
Montana State Univ., Bozeman. Dept. of Biology.
L. R. Kaeding, and C. M. Kaya.
Transactions of the American Fisheries Society, Vol 107, No 3, p 432-438, 1978. 3 fig, 1 tab, 28 ref.

Descriptors: *Fish physiology, *Growth rates, *Brown trout, *Rainbow trout, *Geothermal studies, Seasonal, Food habits, Fish behavior, Fish food organisms, Fish populations, Caddisflies, Thermal water, Fish diets, Water temperatures, Aquatic environment.

Differences in seasonal patterns of growth, length at age, and diet were evident between brown trout residing in geothermally heated and unheated sections of the Firehole River. Maximum temperatures at the warmest station exceeded 28C and averaged about 10.5C higher than the unheated station throughout the year. Scale characteristics indicated that brown trout from the heated stations had two annual growth periods while those from the unheated station had one, relatively short, annual growth period. Brown trout from the heated stations were significantly longer at any particular age than those from the unheated station. Caddisflies were the numerically dominant food in the unheated water while trout at the heated station fed most extensively on dipterans, molluscs, and mayflies. Additionally, trout in the unheated water fed mainly on immature benthic insects while those at the heated station fed heavily on emerging insects and exhibited considerably greater numbers of organisms per stomach. Rainbow trout numerous only at the heated station, had seasonal growth pattern, length at age, and diet similar to those of brown trout at this station. (EIS-Deal)

EFFECTS OF FEEDING AND OF CHEMICAL STIMULATION ON THE OXYGEN UPTAKE OF NASSARIUS RETICULATUS (GASTROPODA: PROSOBRANCHIA),
Dundee Univ. (Scotland). Dept. of Biological Sciences.
M. Crisp, J. Davenport, and S. E. Shumway.
Journal of the Marine Biological Association of the United Kingdom, Vol 58, p 387-399, 1978. 8 fig, 12 ref.

Descriptors: *Oxygen, *Respiration, *Gastropods, *Snails, Animal behavior, Food habits, Absorption, Animal physiology, Oxygen requirements, Animal metabolism, Enzymes, Chemicals.

Exposure to food odours causes an increase in oxygen uptake by Nassarius reticulatus. The response is immediate and lasts between 1/4 and 1/2 h. When snails have fed, oxygen uptake remains elevated for 2-3 days. The duration of elevated rates of oxygen uptake parallels the duration of the behavioral effects of feeding. (EIS-Deal)

Descriptors: *Viruses, Methodology, *Viral recovery rates, *Infectious bovinre rhinotracheitis, *Swab materials, Cotton, Polyester, Calcium, Alginate wool.

The recovery rates of infectious bovine rhinotracheits virus from swab materials were compared. The adsorptive and elutive properties of cotton, polyester, and calcium alginate wool were examined by direct exposure of infectious bovine rhinotracheitis virus to swab materials in buffered tissue culture medium. Calcium alginate wool was virucidal; this was apparent after 2 hours' exposure. Cotton and polyester swab materials exhibited little virucidal effects. The addition of wooden applicator sticks with the swab materials reduced viral titers further.

THE ENVIRONMENTAL EFFECTS OF CHROMIUM IN TANNERY EFFLUENTS,
Barrie Tanning Ltd. (Ontario).
S. A. J. Shivas.
Journal of the American Leather Chemists Association, Vol. 73, No. 8, p 370-377, August, 1978. 1 tab, 14 ref.

Descriptors: *Chromium, *Tannery wastes, *Solubility, *Toxicity, *Chemical properties, Chemical precipitation, Ion exchange, Biological treatment, Activated sludge, Soils, Leaching, Permeability, Membrane processes, Movement, Waste water treatment, Industrial wastes.

The physico-chemical properties of trivalent chromium, present in tannery effluents, were examined with respect to treatment, disposal, and ultimate environmental effects. The potential was very low for reverse oxidation of trivalent chromium to the highly toxic hexavalent chromium by aerial oxidation or pH increases above 4. Cr(III) was precipitated at pH 5-12; the chromite ion formed above pH 12 required manganese ions as a catalyst for oxidation. Cr(III) usually forms in soluble complexes, reducing its potential for leaching into subsoils or groundwater from land-applied sludges. The limited mobility of the triply-charged cation and its aggregation with proteins and other colloids imparted poor membrane permeability to chromium. Complexed Cr(III) in tannery effluent will precipitate with primary sludge and will adsorb on biological flocs in the activated sludge process. The presence of high levels of Cr(III) during biological treatment has been found to reduce the degree of nitrogen breakdown, hinder microbial degradation, and inhibit oxygen absorption by sludge microorganisms. While Cr(III) levels of 300 mg/liter in digesters have been tolerated at retention times longer than 20 days, levels in the feed to a municipal treatment plant were not expected to exceed 10 mg/liter; Cr(III) was found to artificially suppress BOD values. When applied to soils, Cr(III) exhibited an initial toxic effect on microorganisms; chromium was readily immobilized when applied to soils having a moderate to high ion exchange capacity. (Lisk-FIRL)

WATER HARDNESS AND CARDIOVASCULAR MORTALITY,
Ottawa Univ. (Ontario). Dept. of Epidemiology and Community Medicine.
L. C. Neri, and H. L. Johansen.
Annuals of the New York Academy of Sciences, Vol. 304, p 203-219, March 30, 1978. 5 fig, 11 tab, 94 ref.

Descriptors: *Hardness, *Water quality, *Hypertension, *Cardiovascular mortality, Soft water, Magnesium, Cadmium, Canada.

There is a lack of agreement among researchers as to the geographic relationship between water quality and cardiovascular mortality. The presence of lead, cadmium, sodium, nitrates, and the lack of calcium and magnesium in soft water areas are thought to be associated with hypertension and increasing mortality but no definite conclusions have been reached. Several criteria are proposed for judging whether an element is associated with hypertension. They are: Its concentration in water supplies must follow the geographic distribution of water hardness; Its postulated effect has to be consistent with the geographic variation in cardiovascular mortality; Its concentration in drinking water, compared to other sources, must be sufficient to exert the postulated effect. In a recent autopsy study of elements in the myocardium of residents of hard and soft water areas, magnesium was the only one which indicated a pattern by being: More abundant in hard than in soft water areas, More abundant in the myocardium of healthy subjects than of those with heart disease, More abundant in the myocardium of hard water residlents than of soft water residents. Lastly, its concentration in water shows the strongest negative correlation with mortality due to all causes. (Purdin-NWWA)

THE PHOTOSYNTHETIC AND RESPIRATORY RATES AND TOLERANCES OF BENTHIC ALGAE FROM A MANGROVE AND SALT MARSH ESTUARY: A COMPARATIVE STUDY,
University of South Florida, Tampa. Dept. of Biology.
C. J. Dawes, R. E. Moon, and M. A. Davis.
Estuarine and Coastal Marine Science, Vol. 6, No. 2, p 175-185, February 1978. 5 fig, 2 tab, 30 ref.

Descriptors: *Salt marshes, *Mangrove swamps, *Photosynthesis, *Respiration, *Algae, Benthic flora, Seaweeds, Florida, Weeki Wachee River(FL), Cockroach Bay(FL), Estuaries, Salinity, Dessication, Light chlorophyll, Temperature, Intertidal areas, Subtidal areas, Bostrychia binderi, Gracilaria verrucosa, Cladophora repens, Acanthophora spicifera, Catenella repens, Spyridia filamentos, Rhodophyta.

Comparative examination of net photosynthetic and respiratory rates of dominant red and green algae from a salt marsh and from a mangrove community on Florida's west coast showed higher chlorophyll levels among salt marsh algae. Two subtidal and two intertidal species were selected from each site. Optimal temperatures, light intensities, and salinities for the species were compared and effects of dessication on the intertidal species were studied. Net photosynthetic and respiratory rates were similar for both intertidal species from each site, and they showed broad tolerances to salinity with positive photosynthetic responses even when held in distilled water for three days. All intertidal species, monitored in the air as well as submerged, had high photosynthetic rates after dessication periods of four, eight, or sixteen hrs/day for three days. Peak photosynthetic rates for all species occurred at 11,200 microW/sq cm white light at 30-36C and 20-30% salinity. Subtidal algae in the mangrove community had photosynthetic rates 5-10 times higher than in the salt marsh. In the salt marsh, located at the mouth of the Weeki Wachee River, intertidal species studied were Bostrychia binderi and Catenella repens, and subtidal species were Gracilaria verrucosa and Spyridia filamentosa. In the mangrove community at Cockroach Bay intertidal species were Bostrychia binderi and Cladophora repens, and subtidal species were Gracilaria verrucosa and Acanthophora spicifera. AN INVESTIGATION OF PRIMARY PRODUCTION AND ECOSYSTEM METABOLISM IN A LAKE MICHIGAN DUNE POND,
Michigan State Univ., East Lansing. Dept. of Botany.
J. W. Barko, P. G. Murphy, and R. G. Wetzel.
Archiv Fur Hydrobiologie, Vol. 81, No. 2, p 155-187, November 1977. 7 fig, 6 tab, 77 ref. ERDA E(11-1)-1599, (COO-1599-94) (ORD-13999, 4282).

Descriptors: *Primary productivity, *Ponds, *Dunes, *Metabolism, *Algae, *Macrophytes, *Phytoplankton, *Epipelic algae, Ecosystems, Lake Michigan, Carbon radioisotopes, Respiration, Carbon dioxide, Juncus balticus, Photosynthesis, Seasonal, Distribution, Biological communities, Aquatic plants, Trophic level, Michigan.

Net primary productivity of phytoplankton, epipelic algae, and macrophytes in a small (0.25 ha) pond in the sand dunes along Lake Michigan near the Kalamazoo River delta, Michigan, were estimated on an annual basis, along with estimates of gross assimilation and ecosystem respiration. Total net primary productivity (TNPP) was 348 mg C/sq m/day. Macrophytes accounted for 61% of TNPP, followed by epipelic algae at 26% and phytoplankton at 13%. Gross assimilation (547 mg C/sq m/day) exceeded ecosystem respiration (377 mg C/sq m/day). The P/R ratio, estimated at 1.45, indicated potential accrual of organic carbon at 169 mg C/sq m/day, net ecosystem production. Annual assimilatuion efficiency was estimated at 0.42%, and growth efficiency at 64%. In situ carbon-14 fixation determined net phytoplankton and epipelic algae primary productivity, and harvest techniques were used for macrophyte productivity. Gross assimilation and ecosystem response estimates were based on carbon dioxide flux measurements made in portable light and dark metabolism chambers enclosing portions of the pond. Laboratory measurements of photosynthesis using the dominant macrophyte, Juncus balticus, were used to interpret seasonal photosynthesis patterns observed in the field. The pond was autotrophic (P/R 1.0) during summer and heterotrophic (P/R 1.0) in winter. Seasonal distribution and productivity of the algae are discussed. (Lynch-Wisconsin)

WATERHYACINTH (EICHHORNIA CRASSIPES) NUTRIENT UPTAKE AND METABOLISM IN A NORTH CENTRAL FLORIDA MARSH,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
W. J. Mitsch.
Archiv fur Hydrobiologie, Vol 81, No 2, p 188-210, November 1977. 10 fig, 4 tab, 34 ref. NSF GK-34232.

Descriptors: *Marshes, *Water hyacinth, *Metabolism, *Lake Alice(FL), *Nutrients, *Water pollution effects, *Nutrient removal, *Path of pollutants, Eichhornia crassipes, Florida, Lakes, Sewage disposal, Tertiary treatment, Cooling water, Heated water, Sediments, Absorption, Phosphorus, Nitrogen, Water temperature, Primary productivity, Beneficial use, Denitrification.

Effects of high nutrient loading from secondary sewage effluent on the marshy eastern part of Lake Alice, Gainesville, Florida were studied, with special attention to the disposition of nitrogen and phosphorus, and to the metabolism of water hyacinth (Eichhornia crassipes) which dominates the marsh. Construction of an earthen dam in 1948 and addition of the sewage effluent and heated once-through condenser water from a heating plant in 1964 increased the lake's size from four to thirty-three ha. High nutrient levels and water temperatures in the 29-31 range have resulted in gross primary productivity among the highest ever reported--19.3 g C/sq m/day for large hyacinths and 15.6 g C/sq m/day for dwarf hyacinths. Net production efficiencies were about 1.6% of solar insolation for both plants. Uptake of total nitrogen averaged 49% across the marsh. Nitrate showed a seasonal pattern of greater uptake from winter to summer; phosphorus uptake averaged 11% with signs of a net phosphorus export in winter. Rapid nutrient turnover and high water hyacinth metabolism apprarently accounts for the low percentage of nitrogen and phosphorus uptake. Seasonal changes in nitrate levels leaving the marsh suggest denitrification is a significant nitrogen sink, and sediments continue to act as an additional nitrogen source to overlying waters. Use of a hyacinth marsh as a natural tertiary treatment system would require much lower nutrient loading rates to be effective. (Lynch-Wisconsin)

PHOTOSYNTHESIS AND CARBON METABOLISM IN MARINE AND FRESHWATER DIATOMS,
Cologne Univ. (Germany, F.R.) Botanisches Inst.
B. P. Kremer, and R. Berks.
Zeitschrift fur Pflanzenphysiologie, Vol 87, No 2, April 1978, p 149-165. 12 fig, 2 tab, 26 ref.

Descriptors: *Diatoms, *Photosynthesis, *Carbon radioisotopes, *Metabolism, *Darkness, Algae, Carbon dioxide, Amino acids, Carbon fixation, Assimilation, Kinetics.

Several diatom species taken from marine, brackish, and freshwater habitats were used in laboratory experiments to characterize photosynthesis, photosynthetic carbon assimilation, and carbon fixation in the dark. Dark fixation generally did not exceed 4-5% of photosynthetic carbon-14 incorporation. The assimilate pattern of long-term photosynthesis in Hl4CO3 comprised a complex variety of soluble and insoluble assimilates; considerable amounts of carbon-14 were recovered from several amino acids, particularly glutamate. Relatively little carbon-14 was confined to low molecular weight carbohydrates, such as glucose and fructose. Sucrose or polyhydroxy alcohols (mannitol) were not found to be carbon-14 labelled photosynthates. Appreciable amounts were converted to polymeric constituents, mainly polysaccharides and various lipids, accounting for over 60% of total radioacarbon found in soluble assimilates after long periods of photosynthetic carbon-14-fixation. Short-term photosynthetic carbon-14 incorporation experiments resulted in predominant carbon-14 labelling of phosphorylated compounds (such as 3-phosphoglycerate) and some sugar phosphates, showing the typical time-dependent decrease in percentage of carbon-14 labelling; C4 compounds (including asparate and malate) exhibited very different carbon-14 labelling kinetics. Results suggest that photosynthetic carbon fixation in diatoms does not resemble the C4 pathway but generally follows the Calvin scheme. (Lynch-Wisconsin)

DIVERSITY AND ENVIRONMENTS OF BENTHIC INVERTEBRATE COMMUNITIES IN SOUTH SWEDISH STREAMS,
Lund Univ. (Sweden). Dept. of Animal Ecology.
F. Friberg, L. M. Nilsson, C. Otto, P. Sjostrom, and B. W. Svensson.
Archiv fur Hydrobiologie, Vol 81, No 2, November 1977, p 129-154. 2 fig, 6 tab, 37 ref, 2 append.

Descriptors: Streams, *Lotic environment, *Skane(Sweden), *Invertebrates, *Benthic fauna, *Species diversity, *Sweden, Faunal lists, Data collections, Habitats, Species composition, Distribution, Insects, Seasonal, Ephemeroptera, Plecoptera, Coleoptera, Trichoptera, Ecology, Abundance, Larvae, Verkaan Stream(Sweden), Forsakarsbacken Stream(Sweden), Braan Stream(Sweden), Agricultural runoff.

Three streams in the province of Skane in southern Sweden were sampled for benthic invertebrates in May and October 1974 to study relationships between lotic communities and their environments. Streams sampled were the Verkaan, Forsakarsbacken, and Braan, all of which run through farmland, pastures, and deciduous woodland, and which were selected on the basis of moderately fast current, little silt deposition, sparse macrophyte vegetation, and stony or sandy bottom. Overall, environmental diversification within a given stream was so high that benthic communities were almost as different between sites in a stream as between sites in different streams. Some streams were markedly affected by agricultural pollution and other disturbances. A species list is provided in appendices. The general pattern of species abundance distribution is about log-normal. Different samples from the same locality were more similar to each other than to samples from elsewhere in the same stream or in other streams. Species diversity in one season was uncorrelated with that in another, and the major taxa--Ephemeroptera, Plecoptera, Coleoptera and Trichoptera--varied independently with respect to their local diversity. Few correlations were found between environmental variables and community parameters. Colonization assemblages correlated positively with richness of the surrounding natural community if sufficient number of taxa were included. (Lynch-Wisconsin)

DIEL CYCLES OF INORGANIC NITROGEN UPTAKE IN A NATURAL PHYTOPLANKTON POPULATION DOMINATED BY GONYAULAX POLYEDRA,
Bigelow Lab. for Ocean Sciences, West Boothbay Harbor, ME.
J. J. MacIsaac.
Limnology and Oceanography, Vol 23, No 1, January 1978, p 1-9. 6 fig, 1 tab, 28 ref.

Descriptors: *Gonyaulax polyedra, *Phytoplankton, *Diel cycles, *Nitrates, *Ammonium, *Red tide, *Diel migration, Algae, Dinoflagellates, Oceans, Baja California(Mexico), Mexico, Biorhythms, Absorption, Nitrogen, Inorganic compounds, Light, Diatoms, Nutrients, Limiting factors.

Diel uptake rates of N15-labelled nitrate and ammonium by phytoplankton dominated by Gonyaulax polyedra were measured directly in natural populations during a bloom of the dinoflagellate off Punta San Hipolito, Baja California, Mexico in March 1972. To generate uptake rates sufficiently high for these populations to reach bloom proportions, the simultaneous presence of light and inorganic nitrogen (especially nitrate) appeared necessary. Data revealed no significant differences in light requirements between diatoms and dinoflagellates. The apparent paradox of dense populations of dinoflagellates (red tides) occurring in nutrient-depleted surface waters has been observed for many years; possibly, downward migration allows them to take up significant amounts of nutrients in the enriched bottom of the photic zone in the dark. However, field results presented here do not support the hypothesis that dinoflagellates have any special capacity for dark nutrient uptake, nor are special cellular characteristics beyond migration necessary to explain occassions of dinoflagellate dominance. Nevertheless, the dark uptake of nitrate, apparently equally characteristic of starved dinoflagellates and diatoms, plus the migratory capability of dinoflagellates may help to explain the persistence of dinoflagellate blooms after their development. (Lynch-Wisconsin)

EFFECTS OF N:P ATOMIC RATIOS AND NITRATE LIMITATION ON ALGAL GROWTH, CELL COMPOSITION, AND NITRATE UPTAKE,
New York State Dept. of Health, Albany. Environmental Health Center.
G. Y. Rhee.
Limnology and Oceanography, Vol 23, No 1, January 1978. p 10-25. 12 fig, 2 tab, 73 ref.

Descriptors: *Nitrogen, *Phosphorus, *Limiting factors, *Phytoplankton, *Nitrates, *Plant growth, *Eutrophication, Algae, Nutrients, Scenedesmus, Proteins, Absorption, Carbon, Chlorophyll, Baseline studies, Lakes, Estuaries, Cytological studies, Chemostats.

toplankton growth during the transition veen the nitrogen- and phosphorus-limited es common in lakes and coastal seawaters was estigated in laboratory experiments using nedesmus sp. Emphasis was on changes in cel- r composition because the growth rate (mu) of toplankton as limited by various nutrients is a ct function of the cellular level of the rients. Kinetics of nitrogen-limited growth and ogen uptake were also investigated to provide eline information to be used with previous lings on phosphorus-limited growth and up- e. Scenedesmus sp. was grown in chemostats as xed growth rate in an inorganic medium, with ogen-to-phosphorus atomic ratios (N:P) rang- from 5-80. No additive of multiplicative effect he double nutrient limitation was found; below optimal cell N:P of 30, growth was determined ely by nitrogen limitation, while above 30 wth was dependent on phosphorus limitation. d nitrogen remained constant up to the optimal o and above it increased linearly with N:P. The el of cell phosphorus was high at low N:P, but reased rapidly until N:P approached the op- al and at high N:P remained constant at a low el. Protein was the major fraction in which ex- s nitrogen accumulated under phosphorus itation. Cell free amino acids were a constant portion of cell nitrogen at all N:P ratios. RNA ncentration was the same regardless of N:P, h its level determined by mu. Cell carbon was her in the phosphorus-limited states. (Lynch- sconsin)

ASONAL CHANGES IN RESPIRATORY EN- ME ACTIVITY AND PRODUCTIVITY IN KE WASHINGTON MICROPLANKTON,
shington Univ., Seattle. Fisheries Research t.
H. Devol, and T. T. Packard.
nnology and Oceanography, Vol 23, No 1, uary 1978, p 104-111. 3 fig, 1 tab, 46 ref.

scriptors: *Seasonal, *Respiration, *Enzymes, ake Washington(WA), *Eutrophication, hytoplankton, Photosynthesis-respiration ratio, shington, Primary productivity, Lakes, Carbon lioisotopes, Euphotic zone, Microplankton, rk respiration, Photosynthesis, Electron trans- rt system, Nutrients, Phosphates, Stratification.

lculations of cyclical seasonal respiration from ect measurements of electron transport system TS) activity in natural phytoplankton assem- ges are presented for Lake Washington (WA) r January-December 1974. During the first few nths of the year minimum ETS activity (4.2 mg sub eq/sq m/hr), carbon-14 uptake (84 mg C/sq day), and chlorophyll (10.1 mg/sq m), coincided th minimum temperature (about 6.2C) and max- um nutrient concentrations (phosphate, 250 g/sq m; nitrate, 3.5 g/sq m). Maximum ETS ac- ity (109.8 mg 0 sub eq/sq m/hr), carbon-14 up- e (2126 mg C/sq m/day), and chlorophyll (121.7 g/sq m) occurred during spring bloom. During e fall period of thermal stratification and trient depletion, values were intermediate. spiration rates were used to calculate produc- n:respiration ratios (P:R), which were low in e summer and fall and high in winter. The per- ntage of primary production oxidized during a -hr dark period varied from 7-100%, with high rcentages in summer, low in late winter. Dark spiration should be considered in any study of e fate of photosynthetically fixed carbon; 10- % of carbon-14 carbon incorporated by marine gae can be lost in a four-hr dark period. The P:R te has been considered the major single measure the physiological state of phytoplankton popu- tions. (Lynch-Wisconsin)

HYTOPLANKTON EXTRACELLULAR ELEASE AND ITS RELATION TO THE SEASONAL CYCLE OF DISSOLVED ORGANIC CARBON IN A EUTROPHIC LAKE,
State Univ. of New York at Fredonia. Environmental Resources Center.
T. A. Storch, and G. W. Saunders.
Limnology and Oceanography, Vol 23, No 1, January 1978, p 112-119. 4 fig, 1 tab, 24 ref.

Descriptors: *Eutrophication, *Seasonal, *Dissolved organic carbon, *Frains Lakes(MI), *Phytoplankton, *Organic matter, *Degradation(Decomposition), Carbon, Michigan, Lakes, Organic compounds, Bacteria, Littoral, Macrophytes, Algae, Photosynthesis.

Phytoplankton extracellular release was not a significant source of dissolved organic carbon (DOC) in eutrophic Frains Lake, near Ann Arbor, Michigan during major fluctuations of total dissolved organic caron (TDOC). Increases in TDOC concentration greatly exceeded amounts accumulated from release by phytoplankton, even when maximum rates of phytoplankton DOC release were calculated by assuming release exclusively from a large intracellular pool not at isotopic equilibrium. Data suggest that 42-98% of total dissolved organic matter input to the pelagial surface waters is derived from other sources; the most important are probably: (1) decomposition of dead phytoplankton, (2) release by littoral primary producers, and (3) decomposition of particulate organic matter in surficial sediments. DOC released from decomposition of algal detritus is estimated to be two to six times that secreted by living phytoplankton in Frains Lake. Release of DOC by littoral macrophytes and associated flora exceeded release from living phytoplankton by more than double in a marl lake. In this study, conducted April-October 1970, TDOC concentrations fluctuated aperiodically. Phytoplankton DOC release and daily bacterial assimilation rates of phytoplankton extracellular DOC also fluctuated markedly. Bacterial utilization of phytoplankton DOC alone could not account for TDOC decreases. (Lynch-Wisconsin)

GROWTH, MORTALITY, AND BIOMASS PARTITIONING IN FRESHWATER TIDAL WETLAND POPULATIONS OF WILD RICE (ZIZANIA AQUATICA VAR. AQUATICA),
Rider Coll., Trenton, NJ. Dept. of Biology.
D. Whigham, and R. Simpson.
Bulletin of the Torrey Botanical Club, Vol 104, No 4, p 347-351. 2 fig, 1 tab, 21 ref.

Descriptors: *Zizania aquatica var. aquatica, *Wild rice, *Primary productivity, *Biomass, *Plant growth, *Hamilton Marshes(NJ), New Jersey, Marshes, Tidal marshes, Mortality, Delaware River, Wetlands, Marsh plants, Root development, Seeds.

An investigation of wild rice in the Hamilton Marshes on the New Jersey side of the Delaware River April-September 1974 showed very high production rates and high seed production. Net primary production, which varied seasonally, reached July maximum of 20.9 g/sq m/day (0.44 g/plant) following seedling establishment; lowest production rates occurred during the seedling phenophase in May (0.07 g/plant, or 10.2 g/sq m). Productivity declined in late July with the onset of flowering and fruiting, with values of 0.1 g/plant (10.8 g/sq m) in August and September. The highest rate coincided with the period of rapid growth in height, and the decline with the reproductive phenophases, thus wasting minimum energy in shoot and root growth. Potential seed production is estimated at 37,300/sq m. About 65% of biomass was allocated to root production during the seedling phenophase. Population mortality was constant between May and early August. Eight populations of wild rice were sampled during the study in the marshes, the northernmost freshwater tidal wetlands in the Delaware River drainage basin. Seedling densities were determined on May 15, about two weeks after germination; densities were 188 + or - 69 plants/sq m at that time, and biomass averaged 15 g/sq m. (Lynch-Wisconsin)

MORPHOMETRIC CHANGES IN ASTERIONELLA FORMOSA COLONIES UNDER PHOSPHATE AND SILICATE LIMITATION,
Michigan Univ., Ann Arbor. Div. of Biological Sciences.
D. Tilman, S. S. Kilham, and P. Kilham.
Limnology and Oceanography, Vol 21, No 6, 1976, p 883-886, 1 fig, 17 ref. NSF GB-41315.

Descriptors: *Asterionella formosa, *Phosphates, *Silicates, *Limiting factors, *Analytical techniques, *Plant morphology, Morphometry, Methodology, Diatoms, Phytoplankton, Algae, Mesotrophy, Bioindicators, Equilibrium, Colonies, Size, Plant growth, Lakes, Nutrients.

Experiments demonstrated that colony size can be used to assess whether a natural population of the planktonic diatom Asterionella formosa is silicate or phosphate limited. At high steady-state growth rates, the cells per colony averaged eight. Under phosphate limitation, the number of cells per colony decreased linearly with decreasing steady-state growth rate to less than two cells per colony at very low growth rates. Under silicate limitation, the number of cells per colony increased exponentially with decreasing steady growth rate in to over 20 cells per colony at very low growth rates. In nature, increases in colony size above eight cells/colony would indicate silicate limitation, and decreases below 6-8 cells/colony would indicate phosphate limitation. A. formosa is a major phytoplankter in mid-latitude mesotrophic lakes and impoundments. An axenic clone of A. formosa isolated from Frains Lake, Michigan, was used in the tests. Cultures were grown at 20C on a 14-10 hr light-dark cycle with illumination of about 100 microein/sq m/sec in medium WC, modified so that either phosphate or silicate would be the limiting nutrient. The population was allowed to grow to steady state in flow-through, semicontinuous cultures. At rates near the maximum rate of growth, Asterionella was barely limited by any nutrient. Because it is unlikely that steady-state conditions prevail in lakes, colony morphology should not be used to estimate the absolute rate of growth of natural Asterionella populations. BENTHIC ALGAE IN A POND AFTER THE ACCUMULATION OF BEET-SUGAR FACTORY WASTES,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
K. Kyselowa.
Acta Hydrobiologica, Vol 19, No 3, p 215-231, 1977. 1 fig, 1 tab, 20 ref.

Descriptors: *Sugar industry, *Water pollution effects, *Benthic flora, *Algae, *Zimowy Wielki Pond(Poland), *Ponds, Sugar beets, *Poland, Industrial wastes, Sediments, Phytoplankton, Species composition, Primary productivity, Chlorophyll, Floral lists, Waste disposal, Photosynthesis, Diatoms, Bottom sediments.

Species composition and primary production of benthic algae were determined for Zimowy Wielki, Poland, a pond which received wastes from a beet sugar factory at nearby Chybie during 1967-72. The study was carried out in 1974, more than a year after waste disposal had stopped. The attached algal community was accompanied by typical pond planktonic algae. The algae were characterized by benthic or epiphytic species of diatoms. Chlorophytes and cyanophytes were also present. Tables list taxa found at the inflow, outflow and center of the pond on seven sampling dates (April-September). Bottom sediment was sampled with a

tube. Specimens are discussed systematically by taxon. Conditions for survival of the epipelic algae, whose habitat is the upper mud layer, appear to be light and mobility. Greatest chlorophyll-a concentration was consistently found at the inflow (527.9 micrograms/g dry wt) or in the middle of the pond (209 micrograms/g dry wt), whereas at the outflow in the deepest part, about two m deep, chlorophyll-a content was lower (11.32-92.0 micrograms/g dry wt). Abundant benthic algae occurred until the beginning of July, sometimes several times greater than in control ponds or even fertilized ones, possibly indicating continuing effects of the sugar beet wastes and a stimulating influence of biogeneous substances in the sediments. (Lynch-Wisconsin)

PHYTOPHILOUS FAUNA IN PONDS FERTILIZED WITH SUGAR FACTORY WASTES,
Polish Academy of Sciences, Krakow. Zaklad Bioloii Wod.
K. Srokosz.
Acta Hydrobiologica, Vol 19, No 3, p 233-242, 1977. 2 fig, 1 tab, 30 ref.

Descriptors: *Sugar industry, *Invertebrates, *Phytophilous fauna, *Species composition, *Dominant organisms, *Eutrophication, *Ponds, *Industrial wastes, Trophic level, *Poland, Sugar beets, Water pollution effects, Zimowy Wielki Pond(Poland), Lakowy Pond(Poland), Gorol Pond(Poland), Zooplankton, Benthic flora, Algae, Benthic fauna, Chironomidae, Ephemeroptera, Glyceria aquatica, Myriophyllum spicatum, Elodea canadensis, Succession.

Settlement of aquatic plants by phytophilous fauna was studied in two Polish ponds which have received wastes from the Chybie beet sugar factory and one control pond. The objective was to determine dominant fauna and assess the relative influence of trophic conditions and of the host plant in controlling settlement. The accumulation pond Zimowy Wielki, the assimilation pond Lakowy, and the control pond Gorol were sampled biweekly April-September 1971; samples were collected from Glyceria aquatica, common to all three ponds, Myriophyllum spicatum in Zimowy Wielki, and Elodea canadensis in Lakowy. Dominant organisms in all ponds and on all plants investigated were larvae of Chironomidae until midsummer and Ephemeroptera (Cloeon gr. dipterum) from midsummer to autumn. About 120 taxa were identified, with the greatest differentiation of taxonomic groups and species in the control pond and the smallest in the accumulation pond Zimowy. In the most enriched pond (Zimowy Wielki) no qualitative or quantitative differences were noted in fauna settling G. aquatica or M. spicatum, and typical subdominant bottom fauna were observed. In less-enriched Lakowy the influence of plants on fauna settling them was evident; Elodea attracted Ablabesmyia gr. monilis and Nymphula nymphaeta, while Glyceria aquatica attracted Glyptotendipes gr. gripekoveni. Pond trophic condition determined dominance of Cricotopus gr. silvestris (more eutrophic), Corynoneura (medium enrichment), and Psectrocladium gr. dilatatus (low enrichment). (Lynch-Wisconsin)

BIOCENOSIS OF A HIGH MOUNTAIN STREAM UNDER THE INFLUENCE OF TOURISM. 1. CHEMISM OF THE RYBI POTOK WATERS AND THE CHLOROPHYLL CONTENT IN ATTACHED ALGAE AND SESTON IN RELATION TO THE POLLUTION,
Polish Academy of Sciences, Krakow. Zaklad Bioloii Wod.
M. Bombowna.
Acta Hydrobiologica, Vol 19, No 3, p 243-255, 1977. 4 fig, 2 tab, 27 ref.

Descriptors: *Rybi Potok(Poland), *Water pollution effects, *Sewage disposal, *Water chemistry, *Chlorophyll, Streams, *Eutrophication, *Poland, Tourism, Biocenoses, Mountains, Tatra Mountains, Seston, Algae, Benthic flora, Lake Morskie Oko(Poland), Phosphorus, Limiting factors, Electrolytes, Conductivity, Self-purification.

In the Rybi Potok, a mountain stream in Poland's Tatra National Park sewage pollution from a heavily used tourist shelter was especially reflected in phosphate and ammonia levels, and electrolyte concentrations were extremely low. Sampling was conducted February 1971-June 1972 in a four-km section of the stream. Chlorophyll-a content of attached algae and seston was determined. Phosphates and ammonia were found to limit primary production over the entire section of the stream investigated. The stream, flowing on a granite substratum, showed little seasonal variation in the extremely low concentrations of electrolytes and conductivity. Increase in organic matter due to the sewage was only slightly evident in higher BOD5 and free carbon dioxide chiefly below the sewage inflow, where chloride and sodium concentrations also rose. The nitrate to ammonia ratio suggests very rapid mineralization and nitrification. Increased fertility in the stream resulted in increased chlorophyll content in attached algae on an areal basis. At low water levels self-purification of the Rybi Potok was completed before the stream flowed into small downstream ponds, and at high water levels it was completed shortly below the inflow. W79-00218

BIOCENOSIS OF A HIGH MOUNTAIN STREAM UNDER THE INFLUENCE OF TOURISM. 2. BACTERIA AS AN INDEX OF WATER POLLUTION ON THE RYBI POTOK STREAM,
Polish Academy of Sciences, Krakow. Zaklad Bioloii Wod.
A. Starzecka.
Acta Hydrobiologica, Vol 19, No 3, p 257-270, 1977. 3 fig, 3 tab, 23 ref.

Descriptors: *Rybi Potok(Poland), *Water quality indices, *Bioindicators, *Bacteria, *Water pollution effects, *Self-purification, *Eutrophication, *Poland, Lake Morskie Oko(Poland), Tatra Mountains, Mountains, Streams, Sewage disposal, Tourism, Heterotrophic bacteria, E coli, Biocenoses, Denitrification, Annual.

Quantitative changes of several physiological groups of heterotrophic bacteria were compared over the annual cycle in polluted and unpolluted sectors of the Rybi Potok, a mountain stream in Poland's Tatra National Park, to develop a pollution index. Heterotrophic bacteria included were proteolytic ammonifying and denitrifying bacteria and Escherichia coli. Based on numerical changes in bacteria a logarithmic comparative coefficient (LCC) was calculated which permitted differentiation of two zones of self-purification in a 3.2-km section of the stream. Rybi Potok stream is contaminated by sewage inflow from a tourist shelter used by over a million persons/yr upstream at Lake Morskie Oko. Six stations were sampled May 1971-June 1972 at 1.5-mo intervals. It is concluded that sewage disturbs the natural biocenosis of the Rybi Potok, but owing to bacterial biochemical action with favorable oxygen conditions (6.7-12.3 mg 02/liter), self-purification processes counteract noxious effects of the sewage in a short section of the stream. Water quality at Station 1, at the source of Rybi Potok at Lake Morskie Oko, can be regarded as pure, while at Station 2 (the sewage inflow) the water contains great numbers of bacteria and may be classified strongly polluted. At Station 1 the influence of natural factors is manifested in one annual peak in bacterial numbers, while at Station 2 two periods of maximum increases suggest the influence of pollutants. W79-00219

BIOCENOSIS OF A HIGH MOUNTAIN STREAM UNDER THE INFLUENCE OF TOURISM. 3. ATTACHED ALGAE COMMUNITIES IN THE STREAM RYBI POTOK (THE HIGH TATRA MTS, POLAND) POLLUTED WITH DOMESTIC SEWAGE,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
B. Kawecka.
Acta Hydrobiologica, Vol 19, No 3, p 271-292, 1977. 6 fig, 2 tab, 42 ref.

Descriptors: *Rybi Potok(Poland), *Algae, *Water pollution effects, *Bioindicators, *Diatoms, *Succession, *Eutrophication, *Poland, Streams, Mountains, Tatra Mountains, Benthic flora, Sewage disposal, Tourism, Chrysophyta, Mineralization, Self-purification, Fungi, Biomass, Dominant organisms, Annual, Floral lists, Trophic level, Lake Morskie Oko(Poland), Biocenoses.

The succession of attached algal communities along the course of the Rybi Potok, a mountain stream in Poland's Tatra National Park polluted at its source by sewage from a shelter serving over one million tourists annually, is described. Four areas with characteristic vegetative communities are distinguished: (1) Station 1, an oligotrophic environment above the sewage outlet, dominated by the cyanophyte Calothrix gypsophila, and the diatoms Tabellaria flocculosa, Achnanthes microcephala, A. minutissima, and Synedra ulna. (2) Stations 2 and 3, a highly eutrophic 30-m section below the outlet dominated by the cyanophyte Phormidium favosum, the fungus Leptomitus lacteus, and the diatoms Cymbella ventricosa, Navicula cryptocephala, Nitzschia palea, and Gomphonema spp. (3) Stations 4 and 5, the zone of final sewage mineralization extending to 500 m from the outlet, with development of the chrysophytes Hydrurus foetidus and Homoeothrix janthina, and presence of the diatoms Fragilaria capucina, Ceratoneis arcus, and Cymbella vertricosa. (4) Station 6, an oligotrophic segment about 2.7 km downstream, dominated by the chrysophytes Hydrurus foetidus and Homoeothrix janthina, and the diatoms Ceratoneis arcus, Diatoma hiemale, D. hiemale var. mesodon, Cocconeis placentula var. euglypta, Achnanthes minutissima, and A. microcephala. Of 153 taxonomic units identified, diatoms constituted 86.3%, chrysophytes 6.3%, cyanophytes 4.6%, rhodophytes 1.3%, and yellow-brown algae and fungi 0.6%. Quantitative changes in the annual cycle and ecological characteristics are described. (Lynch-Wisconsin)

BIOCENOSIS OF A HIGH MOUNTAIN STREAM UNDER THE INFLUENCE OF TOURISM. 4. THE BOTTOM FAUNA OF THE STREAM RYBI POTOK (THE HIGH TATRA MTS),
Polish Academy of Science, Krakow. Zaklad Biologii Wod.
A. Kownacki.
Acta Hydrobiologica, Vol 19, No 3, p 293-312, 1977. 3 fig, 1 tab, 37 ref.

Descriptors: *Benthic fauna, *Rybi Potok(Poland), *Water pollution effects, *Bioindicators, *Sewage disposal, *Insects, *Eutrophication, Invertebrates, Streams, Mountains, Tatra Mountains, *Poland, Tourism, Biocenoses, Chironomidae, Faunal lists, Mayflies, Self-purification, Larvae, Succession.

Bottom fauna of the Rybi Potok, a mountain stream in Poland's Tatra National Park--polluted at its source by sewage from an intensively used tourist shelter--was sampled 1971-72 to study pollution effects. Characteristic zoocenoses permitted four zones to be distinguished: (1) A septic zone one meter from the sewage discharge, with larvae of the genus Psychoda (Diptera) dominant. (2) A zone of strong pollution 3-10 m below the outlet, dominated by Ostracoda, Oligochaeta, Ne-

ıtoda, and the chironomids Prodiamesa vacea, Paratanytarsus sp, and Chironomus gr. ımmi. (3) A zone of self-purification 30-500 m low the outlet characterized by vigorous in-ease in total fauna, and dominated by the ironomids Orthocladiinae juv., Thienemanniella , and Microcricotopus sp. (4) A pure montane eam zone sampled about 2.7 km below the out-, typical of other Tatra Mountain streams, minated by the mayfly Baetis alpinus and the ironomids Orthocladius rivicula and O. saxosus. e 113% gradient in Zone 4 influences the fauna significantly as the change in sewage concentra-n. The stream rises from Lake Morskie Oko at altitude of 1393 m, flows across a wide terrace, d then spreads to form the Rybie Stawki with a pth of about 3 m. Subsequently the stream be rrows, its gradient increasing rapidly, and the eam rushes down, breaking over huge boulders. ter four km, it enters the Bialka River at an al-ude of 1085 m. Fauna unique to the four zones e discussed in detail. (Lynch-Wisconsin)

model based on a recently-confirmed biochemi-l framework by Werner (1966) and on extensive periments with Skeletonema costatum, haetoceros debilis, and Thalassiosira gravida, as developed for simulating silicon-limited atom growth, in which silicic acid uptake is escribed by Michaelis-Menten kinetics. The odel was specifically designed to simulate eady-state and transient behavior of a silicon-nited diatom population growing in a chemostat. mulations compared with actual chemostat sults indicate the model realistically represents atom response. As diatoms require silicon to nthesize frustules, it can be assumed that silicon pply as orthosilicic acid can at times limit owth. Utilization of silicon within the cell is a nction of silicon available in small intracellular ools, while growth is a function of silica in the ustule. Uptake is frequently limited by the sil-on utilization rate within the cell, which may be t by enzymes, or more likely one key enzyme, hich regulate the process of frustule formation. ther factors, such as light or other nutrients, may so limit growth, and in turn may limit silicon ilization within the cell and silicic acid uptake. ll chemostat verification testing was done with S. ostatum grown at 18C under continuous light. he chemostat perturbation technique was the rincipal subject of the modeling experiments. ee also W73-14188) (Lynch-Wisconsin)

MICROBIAL DEGRADATION OF DDT,
Cornell Univ. Agricultural Experiment Station, Ithaca, NY. Dept. of Agronomy.
M. Alexander.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-026 575, Price codes: A03 in paper copy, A01 in microfiche. Department of the Navy, Office of Naval Research, Annual Report No 4, p 45 p, July 1976. 10 fig, 12 tab, 19 ref.

Descriptors: *Microbial degradation, *DDT, *Bacteria, *Fungi, *Pseudomonas, Biodegradation, Metabolism, Chlorinated hydrocarbon pesticides, Pesticides, Pesticide kinetics, Path of pollutants, Organic pesticides, Organic compounds, Gas chromatography, DDD, DDE, *DDM, *DDA, *DBP, *DBH.

The products formed in the metabolism of DDT by bacteria and fungi were identified as 1,1-dichloro-2, 2-bis(P-chlorophenyl)ethane, 1,1-dichloro-2,2-bis(P-chlorophenyl)ethylene, DDM, DBH, and DBP. Several other, as yet uncharacterized products were also synthesized by these microorganisms. The compounds identified during the degradation of DDT metabolites were: DDM, DBH, and DBP from DDA; DBH and DBP from DDM; and DBH from DBP. An important metabolite reported for the first time with fungi is P-chlorophenylacetic acid (PCPA), a ring cleavage product generated in the degradation of DDM. P-Chlorophenylglyoxaldehyde is also reported for the first time as a product of ring cleavage. (EIS-Deal)

This report describes our research into detrimental effects on marine microbial processes of sub-lethal concentrations of pollutants. In the first section of this report we outline a technique for isolation of specific marine chemotactic bacteria capable of both finding a chemical and utilizing it as a substrate. In the second section of the report we describe the results of our study of the relationship between chemical structures of attractants and chemotaxis of marine bacteria. The third phase of the research described in this report involved a study of the effects of sub-lethal concentrations of petroleum hydrocarbons on organic matter decomposition in seawater. We concluded from these studies that chemotaxis inhibition by sub-lethal levels of pollutants retards organic matter decomposition in seawater. (EIS-Deal)

The fate and effects of a spill of six to eight million gallons of waste crankcase oil refined sludge into the Schuykill River, Pa., in June of 1972 have been studied. The spilled oil contained high concentrations of heavy metals and aliphatic and aromatic hydrocarbons. The spill occurred during a flood, and riverbank trees were coated with oil. Levels of lead were higher in downstream trees; however, no direct permanent effects were noted. Levels of heavy metals in river waters remained below those set by the U.S. Public Health Service for drinking water supplies; however, higher concentrations of lead and zinc were observed downstream. Levels of lead in sediments were higher downstream. Concentrations of petroleum hydrocarbons in sediments were higher downstream. Concentrations of petroleum hydrocarbons in sediment were higher at downstream stations. Concentrations of lead in downstream benthic macrofauna were higher. (EIS-Deal)

ANNUAL SUBSURFACE TRANSPORT OF A RED TIDE DINOFLAGELLATE TO ITS BLOOM AREA: WATER CIRCULATION PATTERNS AND ORGANISM DISTRIBUTIONS IN THE CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, MD. McCollum-Pratt Inst.; and Johns Hopkins Univ., Baltimore, MD. Dept. of Biology.
M. A. Tyler, and H. H. Seliger.
Limnology and Oceanography, Vol. 23, No. 2, p 227-246, March 1978. 15 fig, 50 ref. ERDA EY-76-S-02-3278.

Descriptors: *Red tide, *Dinoflagellates, *Chesapeake Bay, Water circulation, Biological properties, Chlorophyll, Coasts, Tidal waters, Circulation, Water transfer, Depth, Bays, Estuaries, Biology, Marine biology, *Prorocentrum.

An annual, long-range, subsurface transport of Prorocentrum mariae-lebouriae, from the mouth of the Chesapeake Bay to its bloom area in the upper bay, a distance of 240 km, was described and documented completely. Prorocentrum in surface outflowing waters at the mouth of the bay is recruited in late winter into more dense inflowing coastal waters. Strong stratification produced by later winter-early spring surface runoff results in the development of a stable pycnocline. Prorocentrum, now in northward-flowing bottom waters, is retained in these bottom waters. It accumulates in a subsurface concentration maximum below the pycnocline and is transported northward to reach its bloom area in the Patapsco River and north of the Bay Bridge by late spring. The rapidly decreasing depth of the upper bay causes the pycnocline to rise, mixing the previously light-limited Prorocentrum and its nutrient-rich bottom waters to the surface, where rapid growth ensues. Once the dinoflagellate is in surface waters, positive photo-taxis, combined with both wind- and tide-driven surface convergences, produce dense surface patches or red tides. Prorocentrum is retained effectively in the bay until late winter by sequential inoculation into the tributary estuaries on the western shore, which exchange relatively slowly with bay waters. By late winter the annual cycle is complete. Prorocentrum is again in surface waters at the mouth of the bay where it is reintroduced into northward-flowing bottom waters. The mechanisms described provide a key to understanding the origins of subsurface chlorophyll maxima and the delivery of toxic dinoflagellates to coastal bloom areas. (Sims-ISWS)

THE BIOLOGICAL EFFECTS OF TOXIC MATERIAL SPILLS,
Environmental Protection Agency, Edison, NJ.
R. J. Nadeau.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9853-0178 ($0.75). In: Water -- 1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 7-10, 1978, 12 ref.

Descriptors: *Water pollution effect, *Toxicity, *Chemicals, *Ecosystems, Aquatic life, Fish kills, Water pollution, Environment, Phytotoxicity, Biological toxicity, Pollutants.

The environmental impact of toxic material spills depends on both the physical characteristics of the material and the environmental conditions at the time. This point is demonstrated by a discussion of certain general biological toxicity response mechanisms. For example, water soluble substances are likely to produce a stronger and more widespread effect than non-soluble substances. However, non-soluble materials can travel down a stream as an undiluted mass or slug, killing organisms in its path on contact. In other cases, a non-soluble material may be miscible forming a coating over the surface which asphyxiates or prevents proper feeding of some organisms. Toxic substances may act directly to kill life forms and juvenile stages are usually the most sensitive. Toxic substances may also act indirectly by destroying food sources or by reducing resistance to infection and stress. Recovery of damaged ecosystems is discussed with emphasis on the feasibility and desirability of intervening to aid or speed restoration. Careful analyses of genetic, physiological, and ecological factors are essential to deciding where, when, and how restoration attempts should be made. (See also W79-00342) (Majtenyi-IPA)

Descriptors: *Pulp wastes, *Water pollution effects, *Fish, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Chinook salmon, Aquatic animals, Aquatic life, Salmon, *Bioassay, Suspended solids, Water pollution, Fishkill, Resin acids.

Total fish (Fall Chinook salmon) survival occurred in the 96-hr bioassay when a biologically treated unbleached kraft mill effluent was fortified with nonsettleable biosolids which reached a concentration of 9,800 ppm. Studies carried out for periods of 10 and 12 days showed no significant effects of biologically treated effluent containing up to 20 ppm suspended solids on growth rates. The total resin acid concentration in the bioassay solutions was about 36 mg/liter or 36 times that which produces a bioassay response in straight biologically treated kraft mill effluent. The resin acids associated with residual biosolids do not have the same effect on fish as those residing in the dissolved form. Any benefits assigned to resin acids reduction in effluents that are associated with a reduction in suspended biosolids by filtration are considered to be minimal or nonexistent. (Swichtenberg-IPC)

Carbon-14 labeled suspended solids from a laboratory aerated stabilization basin fed bleached kraft mill effluent were introduced into laboratory streams, and their uptake into the periphyton and macroinvertebrate community was monitored. Over 95% of the biosolids measured as total suspended solids (TSS) in the full-scale and laboratory stabilization basins were of bacterial origin. Some biosolids were quickly ingested by a variety of invertebrates, including both grazing and filter feeding organisms. Some organic materials from the ingested biosolids were incorporated into invertebrate tissue, demonstrating one pathway of their incorporation into the aquatic food chain. The introduction of 1-2 mg/liter of TSS into the streams for over two years did not result in measurable differences in the amount of organic matter accumulated on the bottom. (Witt-IPC)

BIOLOGICAL EVALUATION OF ACUTE TOXICITY OF SELECTED FINISHING AGENTS (BIOLOGICZNA OCENA TOKSYCZNOSCI OSTREJ WYBRANYCH SRODKOW POMOCNICZYCH),
Medical Academy, Lodz (Poland).
B. Strzelecka, H. Hubner, T. Jankowska, and J. Rouba.
Przeglad Wlokienniczy, Vol. 32, No. 2, p 74-76, February, 1978. 7 ref, 2 tab.

Descriptors: *Textiles, *Water pollution effects, *Toxicity, Wastes, Industrial wastes, Anions, Cations, Aquatic life, Fishm, Crustaceans, Worms, Invertebrates, Aquatic animals, Effluents, Water pollution sources, Water pollution.

Eighteen commercial cationic, anionic, and nonionic agents used in textile finishing and processing were tested for their toxicity to aquatic organisms (the worm Lumbriculus variegatus, Daphnia magna, the crustacean Asellus aquaticus, and the fish Lebistes reticulatus). All agents are characterized by slow biodegradability and are currently discharged into waterways with industrial effluents. Depending on the test organism, the LC(50)/96-hr toxic levels ranged from 0.004 to 4238 g/liter, the toxicity of most agents being high. The cationic agents were highly toxic for the lower organisms, while fish were affected more by

nic agents. It is suggested that the least toxic
its should be used in finishing (e.g., Erional
S, Utinal 302, and softener IW) and an attempt
ld be made to reduce the concentration of
s agents in the effluents. (Stapinski-IPC)

ts, Geomorphology, Aquatic hibitats.

nges in biotic composition and water quality in
pper mine waste stream were monitored be-
and after a large discharge of waste altered
stream's geomorphology and water quality.
stream carries effluents from a mine tailings
d into Pinto Creek. Initial water quality and
ic composition in the waste stream resembled
e in a control stream; however, after the waste
ix, biotic diversity was reduced and water
ity was degraded. Suspended solids as high as
0 mg/liter (mean, 2,300 mg/liter) during the
urbance settled and quickly blanketed the
am bed and buried benthic vegetation and in-
ebrates. Flow at this time (20 liters/sec) and
equently (less than 8 liters/sec) was in-
quate to completely scour the deposits. As a
lt, biotic composition in the lower stream area
ar after the dam rupture was approximately
less than before the disturbance. Metal
dues (Cu, Mn, Zn, Fe, Mg, Ca, Na) in inver-
ates, aquatic vegetation, fish, and sediments
n the waste stream were significantly higher
those in similar species from unpolluted
ams. The effect of these residues on biotic sur-
l was not yet discernible. (Witt-IPC)

ter pollution effects, *Idaho, Water quality,
vy metals, Water pollution sources, Cutthroat
t, Trout, Aquatic animals, Aquatic life, Fresh-
er fish, Water pollution, *Blackfoot
er(Idaho), Surface mining.

Water analyses of selected streams in the upper Blackfoot River drainage area (in the Caribou National Forest, Diamond Creek Planning Unit, Idaho) showed these streams to be in a near-natural state, with possible modification from surrounding land uses. Physical conditions of fish in these streams were good. No influences from present phosphate mining were found that threatened fish health or survival. Hydrochemically, the Blackfoot system is capable of producing a good cutthroat trout fishery, but high levels of nutrients probably restrict optimum fish populations. (Witt-IPC)

MUSCULIUM TRANSVERSUM IN THE ILLINOIS RIVER AND AN ACUTE POTASSIUM BIOASSAY METHOD FOR THE SPECIES,
Western Illinois Univ., Macomb.
K. B. Anderson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 088, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, 1977. 79 p, 12 fig, 21 tab, 37 ref, 2 append. OWRT B-097-ILL(3).

Descriptors: *Bioassay, *Potassium, Toxicity, Water quality, Water pollution effects, Rivers, *Pollutant identification, *Clams, Fingernail clam, *Illinois River.

The status of Musculium transversum in the Illinois River was investigated in the fall of 1975 by making 3 to 5 Ekman grabs at 20 stations in the Illinois River from mile 18.9 to 277. The findings indicate that M. transversum is restricted to the lower 107 miles of the river at densities of 25.8 to 43.1/m2. Compared with past data the population is greatly reduced, particularly in the middle Illinois River. Other organisms collected were categorized according to major taxonomic groups. An acute bioassay method, utilizing static and continuous-flow systems, was developed for M. transversum to enable investigation of the possible cause of the decline. Potassium was the first toxicant to be studied. The results indicated a lethal threshold of 200 mg/l potassium for adults and probable lethal thresholds of 250 and 290 mg/l potassium for juveniles. Adults responded 5 to 1.6 times faster to potassium in water with a hardness of 243 mg/l as CaCO3 than in water with a hardness of 314 mg/l as CaCO3. Juveniles responded significantly faster at a test temperature of 16.7C than at 6.5C. Potassium concentrations found in water collected near the surface of the Illinois River were not in the acutely lethal range for M. transversum in the laboratory. However, before potassium can be eliminated as a possible cause of decline, a study of the chronic effects of the potassium levels found in the Illinois River must be completed.

A COMPARATIVE IN VITRO STUDY OF THE EFFECTS OF VARIOUS BALANCED SALINE SOLUTIONS ON RESPIRATION RATES OF LIVER TISSUES OF THREE FISH SPECIES,
Tennessee Technological Univ., Cookeville.
P. D. Cothron.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 139, Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, June 1977. 54 p, 13 tab, 28 ref, append. OWRT A-034 TENN(1).

Descriptors: Balanced saline, Respiration, Fish, Respirometric media, Water pollution effects, *Fish tissue respiration, Pollutant identification, *Tissue bioassay, *Bioassay techniques.

A balanced saline solution for fish tissues was needed for use in a series of manometric experiments dealing with oxygen uptake by fish liver. Using literature values, several balanced saline solutions were postulated and were compared to Krebs-Ringer Phosphate. Results of this research indicated that differences in the basic fish and mammalian salines tested did not significantly affect cellular respiration in fish liver mince. In liver tissues which contained sufficient oxidizable substrate, presence or absence of glucose and differences in ionic constitutents of the fish and mammalian solutions tested had no effect on cellular respiration in liver tissue mince during a 45 minute period. In cells apparently lacking sufficient oxidizable substate, glucose-containing media produced results significantly different from those yielded by non-glucose-containing media. Effects of pH and of temperature were observed.

OWRT A-042-PA(5). 14-34-0001-6039.

Descriptors: *Brook trout, *Acidic water, *Hydrogen ion concentration, *Acid mine water, Juvenile trout, Equilibrium, Water pollution effects, *Wild brook trout, Hatchery fish, Embryonic, Adult brook trout, Sodium loss, Sex, Survival ability, Hereditary resistance, Low pH, Sulfuric acid solution.

Several strains of hatchery-reared brook trout were exposed to low pH in the laboratory and in the field. Wild brook trout were also used in some field tests. Tests were both acute and chronic. Pronounced strain differences in survival ability were detected among embryonic, juvenile, and adult brook trout in laboratory tests, and among juvenile brook trout in field tests. Fish had longer resistance times in sulfuric acid solutions and in mine acid polluted water if they were held previously in, respectively, pH 8 laboratory water, or non-acidic field environments. Wild brook trout survived longer at lethal field pH levels than hatchery fish which were tested immediately upon transport from the hatchery. Development of embryonic brook trout was delayed in sulfuric acid solutions of low pH. The time to loss of equilibrium at low pH was well correlated with total survival time. The rate of net sodium loss at low pH was inversely correlated with the resistance times of brook trout. Fish had shorter resistance times in mine acid waters than in laboratory sulfuric acid solutions of comparable pH. Larger and older fish tended to survive longer. The most important factors in enhancement of acid resistance in hatchery brook trout were the hereditary resistance of a

given strain and the acclimation of fish to non-acidic stream or laboratory conditions prior to acid exposure.

ARCADIA LAKE WATER-QUALITY EVALUATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Effects Lab.
R. W. Hall, Jr., R. H. Plumb, K. W. Thornton, R. L. Eley, and A. S. Lessem.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A039 492, Price codes: A14 in paper copy, A01 in microfiche. 315 p 11 fig, 48 tab, 133 ref, 4 append. DOL 740015.

Descriptors: *Water quality, *Mathematical models, *Nutrients, *Water chemistry, *Water properties, Model studies, Eutrophication, Chemical analysis, Water quality standards, Coliform, Pollutants, Turbidity, Algae, Urban runoff, Pesticides, Agricultural runoff, Evaluation, Lakes, Stratification, *Arcadia Lake(Oklahoma), *Lake water chemistry, *Impoundment study, Nonpoint pollution sources.

The water quality of the proposed Arcadia Lake, Oklahoma, was evaluated relative to water quality criteria and standards appropriate for the project purposes. Study procedures included evaluation of existing data and previous studies of streams and lakes in the project area; collection and evaluation of additional field data; determination of available and limiting nutrients through algal bioassays; establishment of relationships between stream discharges and loadings of nutrients, metals, and pesticides based on stream concentrations and land-use patterns; application of various mathematical models; and comparison of predicted or measured results with existing or proposed water quality criteria. A comparison of average values for 70 water-quality parameters with the most stringent standard or criterion revealed that ammonia, manganese, mercury, DDT, dieldrin, aldrin, chlordane, lindane, heptachlor, PCB, phenols, and fecal coliforms equaled or exceeded permissible or recommended levels at least part of the time. Only coliform bacteria, ammonia, and manganese exceeded present Oklahoma standards applicable to proposed reservoir uses. Ammonia would not be expected to reach toxic concentrations in the hypolimnion of Arcadia Lake or to interfere with project purposes. Nutrient evaluations based on concentrations and loading indicated that the proposed impoundment would be eutrophic and that algal blooms were likely to occur during the late spring and summer months. Pesticides would not be expected to be a water quality problem in Arcadia Lake because sorption and precipitation would reduce concentrations significantly and restricted use of some of the pesticides has been implemented or is proposed by the EPA. Coliform bacterial contamination would be limited to the headwaters of the proposed impoundment during base flow. (Henley-ISWS)

NATURE AND IMPACT OF RURAL STREAM INPUTS ON WATER QUALITY,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
F. J. Humenik, M. R. Overcash, F. Koehler, L. Bliven, and J. W. Gilliam.
Transactions of the American Society of Agricultural Engineers, Vol. 21, No. 4, p 676-681, July-August 1978. 2 fig, 4 tab, 6 ref. EPA R803328.

Descriptors: *Water quality, *Virginia, *Streams, *North Carolina, Rural areas, Streamflow, Streamflow forecasting, Water, Land use, Statistical methods, Statistics, Basins, *Rural water quality, *Stream inputs, *Chowan River Basin(NC), Soil-topographic-land use, Statistical survey, Stream reach studies, Statistical sampling.

Rural water quality was assessed by a statistical survey of small subbasins characteristic of rural areas in the Chowan River Basin, North Carolina. The portion of the Chowan Basin designated as study area was stratified on the basis of soil-topographic-land use factors, resulting in statistical coverage of about 25% of the 12,802 sq km (4,943 sq mi) basin. From the 4 designated strata, 15 subbasins were selected randomly to employ stratified random sampling as a monitoring strategy. Two of these subbasins were selected for intensive study of stream kinetic transformations with 6 sampling sites in a 5 km (3 mi) stream reach. After it was noted that water quality was similar in the study streams and the lower river, sampling was conducted to compare concentrations in these two areas. Also, a 32 km (20 mi) stream reach, which included a statistical survey site, was monitored to elucidate the relative magnitude of point and nonpoint impacts. Long-term data for the statistical sampling survey and results from the stream reach studies were presented and discussed. (Roberts-ISWS)

METHOD OF DISPOSING OF WASTE WATER CONTAINING EMULSIFIED OIL,
Sumitomo Electric Industries Ltd., Osaka (Japan). (Assignee).
M. Noda, and K. Nomura.
U.S. Patent No 4,086,164, 10 p, 2 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 969, No 4, p 1431-1432, April 25, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Oil pollution, Separation techniques, Emulsions, Metal working industry, Combustion.

An economical process is provided for obtaining a stable, homogenous mixture which can be burned in combustion apparatus by introducing oil containing emulsified waste water produced in working metal with a water soluble lubricating oil or a water soluble cutting fluid. The oil containing emulsified waste water is concentrated to such a point that it becomes independently combustible. The surface active agent (or agents) which is present in the emulsified waste water is utilized to obtain a stable, homogeneous slurry by mixing the oily substance obtained by the concentration of the emulsified waste water with the inorganic substances obtained by filtering solid foreign bodies from the lubricating oil during metal working. The emulsified waste water is concentrated without breaking the emulsion by means of a physical-chemical apparatus which utilizes an ultra-filtration membrane or other device. (Sinha-OEIS)
W79-00020

TREATMENT OF SOLIDS-LIQUID-GAS MIXTURES,
Imperial Chemical Industries Ltd., London (England). (Assignee).
F. C. Roesler.
U.S. Patent No. 4,086,160, 7 p, 4 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 969, No 4, p 1430, April 25, 1978.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Industrial wastes, *Water pollution treatment, *Activated sludge, Separation techniques, Aeration, Flotation, Sedimentation.

A solids-liquid mixture, such as waste water, containing biologically degradable material is treated in a circulatory system having an alternating upward and downward flow kept in motion by injection of gas such as air. A mixture is diverted from the system into a separating chamber in which solids-enriched mixture is separated by flotation and/or sedimentation. A solids-rich mixture, preferably recycled from the separation chamber, is fed into the system hydrostatically and thereby the concentration of such solids are transferred from one location to another without mechanical pumping. (Sinha-OEIS)
W79-00022

TREATMENT OF EFFLUENT,
C. R. Smith, and B. Mills.
U.S. Patent No. 4,085,688, 9 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 969, No. 4, p 1277, April 25, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, Alkaline water, Hydrogen sulfide, Reduction(Chemical), Gases, Quenching, Scrubbers.

Contaminated aqueous alkali wash liquor from the treatment of gases containing hydrogen sulphide and/or hydrogen cyanide is reconstituted by treatment at an elevated temperature in a reducing atmosphere followed by quenching to form reconstituted wash liquor. The contaminated liquor is concentrated, before entering the reducing atmosphere, by direct contact with hot gases derived from the hot reducing atmosphere. Quenching and concentration are carried out by interaction of a gaseous medium with a liquid spray. Generation of the hot reducing atmosphere, reaction of the contaminated liquor with the hot reducing atmosphere, and concentration of the contaminated liquor may be carried out in a single chamber. (Sinha-OEIS)
W79-00024

TREATMENT OF LIME-SULFIDE TANNERY UNHAIRING WASTE,
Department of Agriculture, Washington, DC. Office of the Secretary. (Assignee).
M. Komanowsky, and H. I. Sinnamon.
U.S. Patent No 4,085,044, 3 p, 2 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 969, No 3, p 1058, April 18, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Industrial wastes, Tannery wastes, Separation techniques, Flocculation.

Improvements in the treatment of lime-sulfide unhairing wastes from both salt-cured and unsalted hides are provided. After undissolved lime is flocculated out of the waste of a salt-cured hide and the supernatant acidified to liberate hydrogen sulfide, the hydrogen sulfide is flashed off under reduced pressure at about from 100 degrees to 150 degrees F. The waste from unsalted hides is sparged with carbon dioxide prior to flocculation, the sparged waste is flocculated with a strongly cationic polyelectrolyte, and the hydrogen sulfide flashed off from the acidified supernatant liquid. orption, *Activated carbon, Flow, Solids con-
processes, Equipment, Countercurrent flow.

ethod of and apparatus for handling granular
on which is used in an adsorption process
oving certain soluble organic compounds from
te water streams is described. It has been
d that flowing waste water through a carbon
mn in countercurrent contact with the flowing
on is a good technique for contaminate
oval. However in relatively small integrated,
abricated sewage treatment plants the height
he column is a critical limitation. Special
niques are required to cause carbon to flow in
lumn if the column does not have a hopper
om, agitator or vibrating mechanisms. One
on that special techniques must be used to in-
carbon flow is that as carbon is removed
the carbon bed, a cavity is produced which is
of anything but water and fines. Because of
cavity, a desired ration of carbon to water
ing out of the carbon outlet port cannot be ob-
ed. In this invention carbon is removed from
bottom of the column by a jet eductor. A
ce of fluidizing water is connected to the
mn adjacent to the eductor to prevent the for-
on of a cavity in the carbon bed in that area
cent to the jet eductor. (Sinha-OEIS)

RIFICATION PROCESS,
gia-Pacific Corp., Portland, OR. (Assignee).
Neal.
Patent No. 4,089,799, 5 p, 7 ref; Official
tte of the United States Patent Office, Vol
No 3, p 1027, May 16, 1978.

riptors: *Patents, *Waste water treatment,
ustrial wastes, *Water pollution treatment,
ended solids, Separation techniques, Floccu-
, Magnetic properties, Ferromagnetic or-
composition.

A process is described for clarification of an aqueous liquid by Flocculating the finely divided particles in the liquid into a floc having magnetic properties and employing a magnetic field to enhance the settlement or separation of the magnetic flocs. The aqueous liquid is flocculated with a metal hydroxide, a water-soluble ferromagnetic lignosulfonate, ferromagnetic sulfonated tannin, or a ferromagnetic sulfonated phenol condensed with an aldehyde. The ferromagnetic composition is added in conjunction with an insoluble metal hydroxide flocculating agent or compound. The ferromagnetic organic compositions becomes associated or combined with the floc or flocculated particles to impart magnetic characteristics to the particles. The flocculated contaminants may then be removed from the liquid by using a magnetic filter or by settling in the presence of a magnetic field which will considerably increase the rate of settlement.

W79-00043

METHOD FOR TREATING SEWAGE,
J. L. Ramer.
U.S. Patent No. 4,089,761, 4 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 970, No 3, p 1022, May 16, 1978.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, Biological treatment, Aerobic conditions, Oxygenation, Electrolysis, Anodes, Cathodes, Mixing, Equipment.

A method and apparatus for treating sewage is provided by first comminuting raw sewage to provide a slurry and then digesting the raw, comminuted sewage by oxygen-dependent bacteria in a roofed compartment. Oxygen is supplied by electrolysis of the water in the sewage, utilizing spaced anode and cathode. The anode is located in the roofed digestion compartment, and the oxygen generated at the anode is used by the bacteria; the cathod is located in a chimney which extends through the roof or top of the plant, to atmosphere, and the hydrogen generated at the cathod is discharged to the atmosphere through this chimney. A stirrer is provided in the digestion compartment to stir trapped oxygen back into the mass of sludge. A trapping or sedimentation comparment is provided after the digestion compartment, for settling out indigestible solids, and drawing off the remaining liquid. (Sinha-OEIS)
W79-00044

METHOD FOR CLARIFYING AQUEOUS WASTE LIQUIDS CONTAINING ACID DYES,
Nippon Carbide Kogyo Kabushiki Kaisha, Tokyo. (Assignee).
M. Nakajima, and K. Kuwabara.
U.S. Patent No. 4,088,573, 6 p, 2 fig, 1 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 970, No 2, p 635, May 9, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Dyes, Water purification, Separation techniques, Chemical precipitation, Flocculation, Resins, Filtration.

A method is provided for clarifying aqueous waste liquids containing acid dyes. The optimum amount of the dicyandiamide-formaldehyde resin and at least about 300 ppm, preferably at least about 350 ppm, of aluminum sulfate, both based on 100 ppm of the dye in the waste liquid, are added sequentially. There is no limitation in the order of adding them, but either can be added first. For example, the above resin is added to the waste liquid whose pH has been adjusted to a desired value, preferably an acidic region of not more than 7, in the course of conducting the waste liquid to a sedimentation apparatus or filtration apparatus, and the mixture is stirred so as not to cause nonuniformity in concentration. This results in the formation of a flocculated matter. Then, aluminum sulfate is added, and the mixture is stirred somewhat slowly. The flocculated dye can be sedimented or collected by filtration. Conversely, aluminum sulfate can be added first and then the resin. (Sinha-OEIS)
W79-00053

ACTIVATED SLUDGE SYSTEM WITH STAGGERED PARTITION BASIN,
Air Products and Chemicals, Inc., Allentown, PA. (Assignee).
C. S. Block, M. S. Chen, O. J. Noichl, and S. Hong.
U.S. Patent No. 4,087,361, 6 p, 4 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 970, No 1, p 238, May 2, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Water purification, *Aeration, Settling basins, *Activated sludge, Mixing, Equipment.

A method and apparatus is provided for aerating mixed liquor in an activated sludge waste treatment system with aeration gas in which the geometry of the basin, and the mode of operation of te aerators aerating the mixed liquor, produce a series of liqid zones through which the mixed liquor flows in a generally serpentine manner from one noncompletely mixed liquor zone to the next such that the degree of effective liqid staging is greater than that achieved before. As a result, significantly more efficient purification of the influent wastewater stream can be achieved. (Sinha-OEIS)
W79-00055

PROCESS FOR REMOVING MERCURY AND MERCURY SALTS FROM LIQUID EFFLUENTS,
Montedison S.p.A., Milan (Italy). (Assignee).
G. Patron, D. Napoli, F. Nardone, G. Ratti, and G. Tubiello.
U.S. Patent No. 4,087,359, 4 p, 13 ref; Official Gazette of the United States Patent Office, Vol 970, No 1, p 237, May 2, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, *Mercury, Separation techniques, Chemical reactions, Chemical precipitation, Coagulation.

A process is described in which mercury is removed from liquid effluents by precipitation with the use of only one reagent, regardless of the form in which the mercury is present. The mercury

is removed in such a form as to separable from the effluents by simple clari-flocculation. The mercury is effectively removed without prior remova of the suspended mud and inert products by filtering upstream from the purification plant. The process is accomplished by reacting the effluent, at a pH of from 9 to 14, with thiourea or with a hydroxylamine salt to precipitate the mercury and/or mercury derivatives and then separating the precipitate, together with muds and inert products, if any, by simple clari-flocculation. When thiourea is fed into waters containing mercury and/or mercury salts, it functions both as a precipitating agent and as a reducing agent and as a reducing agent for oxidizers, such as chlorine, which may be present. Hydroxaylamine serves as both a precipitating agent for forming highly insoluble amino-mercury salts and as a reducing agent which originates metallic mercury from mercury derivatives. (Sinha-OEIS)

WATER REUSE AT HIGHWAY REST AREAS: EVALUATION PHASE,
Virginia Highway and Transportation Research Council, Charlottesville.
C. E. Parker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 542, Price codes: A05 in paper copy, A01 in microfiche. Report VHTRC 78-R22, December 1977. 89 p, 24 fig, 21 tab, 7 ref, 4 append. HPR 1397 (C).

Descriptors: *Water reuse, *Water conservation, *Waste water treatment, *Rest areas, Filtration, Closed loop system, Granular filter, Biological oxidation, Biological treatment, Nitrification, Nitrates, Nitrites, Ammonia, Sewage, Sewage effluent, Aeration, Waste treatment, Water treatment, Highways, Chemical reactions, Recycling.

A system for recycling water used to flush water closets at a highway rest area on I-81 at Fairfield, Virginia, is evaluated. The method produces water of acceptable standards with no objectional odor or color, no foaming or apparent suspended solids, and having low bacterial count. Preliminary bench-scale research indicated that extended aeration biological treatment followed by granular media filtration would be acceptable. This led to installation of a full-scale field system at an existing rest area. A closed loop system was set up to and from water closets, with water balance achieved by wasting an amount of recycled water equal to the water input from sewered potable water. Equilibrium was achieved and recycling was estimated at 95%. Operation of the closed loop extended aeration and granular filter system was similar to conventional operation of these processes. The influence of nitrogen accounted for the most significant operating difference. Ammonia nitrogen transformation to nitrite and nitrate nitrogen resulted in an operating pH of 5.5 to 6.0 and, as a result, incomplete nitrification occurred. Although nitrogen buildup in the form of ammonia, nitrite and nitrate did occur, the concentrations did not cause a reduction in organic biological oxidation efficiency. Quality of the water varied between winter and summer operation, but remained acceptable as a flush fluid. (Majtenyi-IPA)

TRANSPIRATION AND EVAPORATION OF SEWAGE EFFLUENT,
Auburn Univ., AL. Engineering Experiment Station.
S. R. Jenkins, and F. J. Molz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 389, Price codes: A05 in paper copy, A01 in microfiche. Report HPR No. 81, December 1976. 75 p, 20 fig, 61 ref, 4 append. 930-074.

Descriptors: *Sewage treatment, *Sewage disposal, *Sewage effluents, *Spray irrigation, *Liquid wastes, *Evapotranspiration, Environmental sanitation, Evaporation, Transpiration, Highways, Waste water treatment, Waste water disposal, Irrigation, Spraying.

Experimental efforts to develop better methods of treating liquid wastes from roadside comfort stations are described. Existing methods of treating such wastes are often costly to operate and maintain and may not meet new State and Federal restrictions on waste discharges from lagoons and septic tanks. These experiments were aimed at developing practical, zero-discharge procedures for utilizing the evapotranspiration phenomenon to dispose of sewage effluent. In one experiment, impervious evapotranspiration units were constructed in rectangular excavations. Both raw domestic waste and settled domestic waste were pumped into or sprayed onto the units and the evapotranspiration rate was determined through a water balance. In a second experiment, effluent from a two-stage lagoon was sprayed on an area planted with grass and shrubs. Tests indicate that a 20,000 gallon per day comfort station would require a spray area of about five acres. It is concluded that such disposal systems are practical for many areas of the state, and that a well-designed, lagoon-fed spray irrigation system will be an economical, ecologically-sound method for disposing of liquid wastes from roadside rest areas. Such systems require little maintenance and blend in with the landscaping normally found at such comfort stations. (Majtenyi-IPA)

ENERGY CONSUMPTION OF ADVANCED WASTEWATER TREATMENT AT ELY, MINNESOTA,
Corvallis Environmental Research Lab., OR.
D. J. Hernandez.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 270, Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-600/7-78-001, Jan 1978, 20 p, 1 fig, 6 tab, 10 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Energy consumption, *Ely, MN, Sludge pumping, Vacuum filtering, Sewage, Sewage treatment, Waste water, Municipal wastes, Sludge treatment, Primary productivity, Waste treatment, Water treatment.

Energy use at the advanced waste water treatment plant in Ely, MN, is analyzed and discussed under three categories; plant operation, support services, and indirect use. Some historical background is provided along with a description of the plant facilities. Direct energy utilization is defined as that actually involved in operating pumps, motors, chemical feed equipment, lighting, and heating. Energy used during primary, secondary, and tertiary plant treatments is noted. In addition, other energy consuming operations, such as sludge pumping and vacuum filtering are outlined in detail. Calculations for estimating energy consumption are supplied for direct energy useage only; however, indirect energy requirements that include energy consumed in making or processing materials used at the Ely plant, are probably greater. DEGRADATION OF AQUEOUS PHENOL SOLUTION BY GAMMA IRRADIATION,
Hiroshima Univ., (Japan). Inst. of Environmental Chemistry.
K. Sato, K. Takimoto, and S. Tsuda.
Environmental Science and Technology, Vol. 12, No. 9, p 1043-1046, September, 1978. 6 fig, 2 tab, 11 ref.

Descriptors: *Phenols, *Gamma rays, *Irradiation, *Chemical degradation, *Chemical wastes, Aqueous solutions, *Oxygenation, Chromatography, Infrared radiation, Mass spectrometry, Analytical techniques, Carbon dioxide, Waste water treatment, Industrial wastes.

The degradation products of an oxygenated phenol solution, gamma-irradiated with 53,000 rad/hr, were identified by high-speed liquid chromatography. Phenol degradation by irradiation followed the first order, yielding p-benzoquinone, hydroquinone, and catechol. Ether extraction of the first peak, representing a mixture of polar compounds, yielded eight additional peaks; these were identified by ultraviolet spectrophotometry as o,o'-biphenol, catechol, maleic acid, hydroquinone, and 1,2,4-trihydroxybenzene. Two unidentified peaks were further analyzed by infrared and mass spectrometry. One peak resembled either a muconic acid, aliphatic acid, or aldehyde; the other red-brown hydrazone was thought to have two carbonyl groups and at least two hydroxyl groups. Phenol consumption from 10, 50, 100, and 1000 ppm solutions indicated that the potential for recombination of irradiation-supplied radicals was greater at lower phenol concentrations. The number of phenol molecules destroyed per unit dose decreased with the residual phenol level in solutions bearing more than 50 ppm phenol; the degradation percentage increased as the phenol concentration decreased. Total organic carbon degradation decreased with increasing irradiation dosage. About 95% phenol consumption was required before total organic carbon was reduced; a radiation dose five times that needed to consume 95% of the phenol was required to convert phenol to carbon dioxide. At 60-70% phenol consumption, a secondary degradation of the primary products, catechol and hydroquinone, occurred. (Lisk-FIRL)

CONTROLS DRIVE PLATERS TO MATERIALS RECOVERY,
J. J. Obrzut.
Iron Age, Vol. 221, No. 33, p 35-36, 38-39, August, 1978. 2 fig, 4 tab.

Descriptors: Metals, *Chromium, *Nickel, *Reverse osmosis, *Electrodialysis, Ion exchange, Chemical, Phosphorus compounds, Chemical precipitation, Activated carbon, Ozone, Evaporators, Cadmium, Copper, Lead, Zinc, Mercury, Waste water treatment, Industrial wastes.

Processes to recover metals from electroplating effluents have been devised for compliance with stricter waste water discharge and toxic substances controls. Tubular, spiral-wound, and hollow-fine-fiber reverse osmosis units have been tested by the EPA for the recovery and recycling of process chemicals. The reverse osmosis permeate is returned to the rinsing tanks and metal concentrates are returned to the plating baths. Electrodialysis, especially following reverse osmosis, has been tested for treating concentrated effluents. Electrodialysis in conjunction with ion flotation has been effective in concentrating fluoborate reagents; the success of this treatment process may encourage the replacement of cyanide with fluoborate. Electrodialysis may also be applicable to recovery of hexavalent chromium and nickel from plating effluents. Evaporators for chromic acid recovery have reduced the acid requirements at one plant by 80%; evaporators are also being used to treat phosphate cleaning solutions. At ion exchange system also recovers phosphoric acid used in the bright finishing of aluminum; the reciprocating flow ion exchange system removes nickel salts from rinses. Iron sulfide precipitation is recommended for mixed metal effluents; activated carbon and ozone treatment of

ting wastes are also considered feasible. (Lisk-RL)

MOVAL OF COMPLEX COPPER-AMMONIA NS FROM AQUEOUS WASTES WITH FLY H,
nnessee Valley Authority, Chattanooga. Div. of vironmental Planning.
. Chu, G. R. Steiner, and C. L. McEntyre.
rnal Water Pollution Control Federation, Vol. No. 9, p 2157-2174, September, 1978. 17 fig, 5 , 29 ref.

scriptors: *Copper, *Ammonia, *Fly ash, emical precipitation, *Waste dilution, Adsorp-, Alkalinity, Ammonium compounds, Bond- Chemical properties, Metals, Waste water tment, Industrial wastes.

e use of alkaline fly ash sluice water to dilute moniated-bromate metal cleaning wastes can uce residual copper levels to within 1.0 /liter, as mandated by EPA guidelines. Fly ash ce water pH, initial copper concentration, am-nia-to-copper mole ratio in the waste water, per precipitation by alkalinity, copper adsorp- on fly ash, and retention time are investigated factors influencing the efficiency of copper and monia removal. Theoretical copper residual ves after ash waste treatment are developed for ious ratios of copper, ranging 0.001-0.01 mole, mmonia, ranging 0.05-0.4 mole at pH>6. At pH an initial copper concentration of 100 mg/liter l an ammonia-to-copper mole ratio of 40 in a ste stream should not require dilution to duce a residual of 1.0 mg copper/liter; dilution equired for higher copper concentrations. The acity of fly ash to adsorb copper increases with reasing pH (11 to 11.9) and fly ash concentra-; copper precipitation decreases from 98.28 to 34% as pH increases from 11 to 11.9. The op-um parameters for removing copper and am-nia from metal cleaning waste streams include: tion in an ash pond with a pH greater than 8.5; y ash concentration of 1.7% in the raw fly ash ce water; and a retention time of 4-10 hrs. sk-FIRL)

COVERY OF TIN FROM ELECTROPLAT- SOLUTIONS AND RINSE WATERS,
llongong Univ. (Australia). Dept. of Chemistry.
llis, and R. W. Whitton.
luent and Water Treatment Journal, Vol. 18, 8, p 389-391, August, 1978. 3 fig, 3 tab, 9 ref.

scriptors: *Tin, *Solubility, *Alkalis(Bases), dium compounds, *Chemical precipitation, gnesium, Calcium, Iron compounds, Colloids, tals, Waste water treatment, Industrial wastes.

oratory tests investigated the parameters in-ncing the solubility of hydrous tin oxides O), precipitated from spent electrotinning ef-nt, in aqueous alkaline solutions. A typical nt electroplating stream, bearing 1.3 g/liter of II), 0.5 g/liter of tin(IV), and 2.1 g/liter of ride, was treated with solid Na2CO3 to cipitate HTO; the resulting concentrated slurry tested for solubility in alkalis by mixing a 100 aliquot with 100 ml of a NaOH solution. After ting and filtration, 10 ml aliquots of the suspen- and filtrate were mixed with concentrated SO4, HCl, and distilled water; the tin was uced to tin(II) by boiling and each solution was ted with a KIO3 solution. Alkaline solubility expressed as a function of the titrametric end-nts of both solutions; HTO was examined with a scanning electron microscope, X-ray fluorescence, and an electron microprobe. The precipitated HTO contained small amounts of Na, K, Fe, Si, Mg, Ca, Al, and other heavy metals. The adsorption of Ca and Mg ions onto HTO(IV) enhanced solubility; the presence of colloidal iron compounds improved solubility slightly. The HTO(IV) solubility in alkali was severely reduced at temperatures above 50C; tin(II) was relatively unaffected by temperature, although solubility decreased at higher Mg and Ca concentrations. The alkali solubility of HTO was slightly enhanced by the addition of a nonionic polyacrylamide. The ratio of tin(II) to tin(IV) in the electroplating effluent had a strong influence on alkali solubility. (Lisk-FIRL)

THE EFFECT OF CYCLOHEXANE DERIVATIVES ON SELECTION OF BACTERIAL GROUPS FORMING ACTIVATED SLUDGE MICROFLORA,
Warsaw Univ. (Poland). Dept. of Environmental Microbiology.
A. Bisz-Konarzewska.
Acta Microbiologica Polonica, Vol. 27, No. 2, p 155-160, 1978. 4 fig, 1 tab, 12 ref.

Descriptors: *Activated sludge, *Oil wastes, *Oil industry, *Pseudomonas, *Inhibition, Enteric bacteria, Cultures, Microorganisms, Incubation, Microbial degradation, Dominant organisms, Waste water treatment, Industrial wastes.

The presence of cyclohexane derivatives in oil waste favored the growth of Pseudomonas bacteria during activated sludge treatment. Both gram-negative and positive bacteria representing three Pseudomonas groups, contained in activated sludge with Enterobacteriaceae, Vibrio-Aeromonas, Achromobacter-Alcaligenes, and Flavobacterium, were exposed to 30, 100, and 200 mg/liter of cyclohexanol, cyclohexanon, or cyclohexylamine in a basal medium. Pseudomonas comprised more than 50% of the gram-negative bacteria which accounted for 90-97% of the total population. After 7 days of growth in the unspiked basal medium, Pseudomonas predominated, gram-positive bacteria diminished, and Flavobacterium was completely eliminated. Other gram-negative bacteria were hindered by the presence of cyclohexane derivatives after 7 days of incubation. Pseudomonas comprised 75-91% of the population grown in the presence of cyclohexanol, 93-97% in the cyclohexanon medium, and 76-99% in the cyclohexylamine culture. After 7 days in the control medium, Enterobacteriaceae, Vibrio-Aeromonas, and Achromobacter-Alcaligenes comprised 23-36% of the total population; their proportions were similar in the presence of cyclohexanol. Cyclohexanon and cyclohexylamine media greatly reduced or completely eliminated these gram-negative bacteria. (Lisk-FIRL)

CONTROLLING AND MONITORING ACTIVATED-SLUDGE UNITS,
Polybac Corp., New York.
G. T. Thibault, and K. D. Tracy.
Chemical Engineering, Vol. 85, No. 20, p 155-160, September, 1978. 11 fig, 13 ref.

Descriptors: *Activated sludge, *Oil wastes, *Oil industry, *Organic loading, *Toxicity, Oxygen demand, Dissolved oxygen, Growth rates, Biological treatment, Microbial degradation, Waste assimilative capacity, Waste water treatment, Sulfides, Industrial wastes.

Process monitoring and control techniques for refinery waste activated sludge units can prevent system upsets caused by organic and toxic shock loads. Cyanide shocks can cause a rapid decrease in the microbialgrowth rate and dissolved oxygen uptake rate (DOUR); sulfides also inhibit the growth rate but increase the DOUR. Maintaining a constant solids residence time (SRT) is equivalent to maintaining a constant microbial growth rate. The resistance of refinery activated sludge to shock loads increases as the SRT increases from 5 to 25 days. Clarifiers are usually designed to operate at a solids flux of 15-25 lbs/sq ft/day; solids flux is defined as the product of the influent flow rate, recycle rate, and total aeration basin suspended solids per unit surface area of the clarifier. Frequent monitoring of the DOUR and the total oxygen demand (TOD) or total organic carbon (TOC) in the feed stream can signal on-line changes in the growth rate. By monitoring the DOUR:TOD or TOC ratio, organic toxic loading can be detected; for toxic shocks caused by chemically oxidyzable sulfide, TOC must be monitored. Sludge wasting should cease at the onset of both toxic and organic shocks; additions of powdered activated carbon may protect microbial viability during toxic shocks. Dissolved oxygen should be maintained above 0.5 mg/liter during organic shocks. Shock loads can be effectively controlled by diverting toxic streams to holding basins and organic streams to the aeration basin exit to reduce solids flux.

REMOVAL OF AMMONIUM SULFIDE FROM WASTEWATER BY LIQUID MEMBRANE PROCESS,
Exxon Research and Engineering Co., Linden, NJ.
R. P. Cahn, N. N. Li, and R. M. Minday.
Environmental Science and Technology, Vol. 12, No. 9, p 1051-1056, September, 1978. 6 fig, 3 tab, 9 ref.

Descriptors: *Ammonium compounds, *Hydrogen sulfide, *Oily water, *Emulsions, *Permeability, Liquids, Steam, Permselective membranes, Separation techniques, Oil wastes, Oil industry, Waste water treatment, Industrial wastes.

Extripping, a liquid membrane process, has been developed to simultaneously extract ammonia from aqueous solutions and air- or steam-strip hydrogen sulfide from refinery sour water streams. Extripping utilizes a water-in-oil emulsion as the liquid membrane and a dissociated acid, such as sulfuric acid; under agitation, the oil emulsion forms droplets which surround the aid. Operated at 80 C, the extripping tower receives a stream of air, steam, or flue gas through its base as the ammonium sulfate effluent stream is introduced through the top of the column. Ammonia molecules permeate across the liquid membrane where they are neutralized and ionized by the acid; ammonia diffusion across the membrane into the emulsion droplets will continue as long as the undissociated ammonia concentration in the external phase is higher than the internal emulsion droplet concentration. The pH drops as ammonia permeation increases and the external concentration decreases, contributing to an increase in undissociated H2S and enhanced stripping. H2S-laden gas is passed through a condenser for reflux of all residual ammonia and then to a Claus plant for sulfur recovery. When a regenerable acid is used, ammonia is separated from the emulsion by heating; a sulfuric acid-bearing emulsion is broken to recover an ammonium sulfate solution suitable as a fertilizer. Extripping can achieve 95% or more removal in 10 min and 99% or more removal in 20 min.

NEKOOSA CLEANS CONDENSATES WITH STEAM DISTILLATION,
Mo Do Mekan, London(Ontario).
T. Burgess, and D. Voight.
Pulp and Paper Canada, Vol. 79, No. 8, p 72-74, August, 1978. 1 fig, 3 tab.

Descriptors: *Distillation, *Steam, *Condensation, *Pulp wastes, Pulp and paper industry, Sulfur compounds, Gases, Incineration, Heating, Organic compounds, Separation techniques, Waste water treatment, Industrial wastes.

A distillation column at Nekoosa Papers Inc.'s kraft mill in Wisconsin steam strips methanol, turpentine, and total reduced sulfur compounds (TRS) from digester blow gas, and foul condensates from turpentine recovery, and black liquor evaporation. The total condensate volume was reduced by separating the condensates from the multiple effect evaporators and by replacing the direct contact pre-coolers and intercondensers in the evaporators with indirect types. These modifications reduced the condensate to a flow of 336 gal/min, bearing 500 ppm TRS, 540 ppm turpentine, and 1800 ppm methanol. About 29,000 lbs steam/hr were needed in the distillation column to remove 90% of the methanol and all of the TRS and turpentine; by placing the 8-ft diameter, 60-ft high column between the first and second effects of the multiple evaporators, steam was supplied to the stripping column at lower costs. The condensate passes through a fiber strainer to remove particles prior to heating to 220 F in a heat exchanger. The condensate enters the top of the stainless steal distillation column and is stripped of contaminants as it passes down through the trays. The stripped pollutants and foul gases comprise the primary fuel in a fume incinerator which converts the products to water vapor, carbon dioxide, and sulfur dioxide at nearly 100% efficiency. Clean condensate passes through the heat exchanger to heat incoming condensate and is returned to the brown stock area for hot water tank makeup. Steam distillation reduces BOD by 85%, methanol by 89%, and sulfide by 99% after black liquor oxidation.
W79-00162

COLLECTING BARK BURNER ASH WITH ELECTROSTATIC PRECIPITATORS,
Research-Cottrell, Inc., Bound Brook, NJ.
R. L. Bump.
Paper Trade Journal, Vol. 162, No. 18, p 56-57, September, 1978. 1 fig.

Descriptors: *Pulp and paper industry, *Electrodes, *Dusts, *Bark, *Wood wastes, Air pollution, Resistivity, Electrical resistance, Boilers, Separation techniques, Ionization, Pollution abatement, Industrial wastes.

Electrostatic precipitators have been installed in two pulp and paper mills to remove fly ash from bark-fired boilers. In an electrostatic precipitator, entrained dust particles are ionized as the effluent stream passes between grounded collection plates, parallel to high-voltage electrodes, and collected on the electrodes. A removal efficiency of greater than 99% is possible with coal ash. Comparison of bark ash resistivities at temperatures of 250-650 F with resistivities occurring in municipal incinerators suggested that electrostatic precipitators could efficiently function with bark ash. A hog-fuel-fired pilot plant confirmed that bark ash fell within the resistivity range of the precipitator. Because of the light, flaky, and highly carbonaceous nature of the bark ash and large char particles within the gas stream, the electrostatic precipitator installed in the P.H. Glatfelter Co. plant in Spring Grove, Pennsylvania, incorporated a cyclone collector to remove large chars prior to the precipitator and a small length-to-height ratio; the velocity was also reduced to prevent re-entrainment of particles by flowing gas. The Georgia Kraft Co.'s boiler streams exhibited a bark ash resistivity of 8.74 billion ohms/cm and a coal ash resistivity of 85 billion ohms/cm; the bark ash was found to have a modulating effect on more resistant materials. A comparative survey indicated that precipitators had moderate installation costs and lower operating costs than fabric filters and scrubbers.
W79-00163

THE RADIATION-INDUCED DEGRADATION OF LIGNIN IN AQUEOUS SOLUTIONS,
Oji Paper Co. Ltd., (Tokyo) Japan.
T. Nagai, and N. Suzuki.
International Journal of Applied Radiation and Isotopes, Vol. 29, No. 4/5, p 255-259, 1978. 9 fig, 11 ref.

Descriptors: *Gamma rays, *Irradiation, *Optical properties, *Lignins, *Pulp wastes, Color, Organic compounds, Absorption, Oxygen, Nitrogen, Carbon dioxide, Chemical degradation, Oxidation, Pulp and paper industry, Waste water treatment, Industrial wastes.

Gamma irradiation in the presence of oxygen and nitrogen monoxide degraded sodium ligno sulfonate in aqueous solutions comparable to pulping waste water. A 200 ml aliquot of an aqueous solution bearing 100 ppm sodium ligno sulfonate was irradiated at room temperature with cobalt-60 gamma rays at dosages of 190,000 and 1,100,000 rad/hr; oxygen was bubbled through the liquid and, in some experiments, nitrogen or N2O was introduced. Absorption bands at 202.5 and 280 nm decreased with increasing irradiation dose and nearly disappeared at 5,500,000 rad for oxygen-saturated solutions; the reduction in optical density at 202.5 nm was greater for the N2O-saturated solution than for the oxygen- or nitrogen-saturated solutions. At 400 nm, the optical density in oxygen-saturated solutions increased with doses up to 1,100,000 rad and decreased with further irradiation; color nearly disappeared at 16,500,000 rad. The presence of normal-alcohols in nitrogen-saturated solutions significantly enhanced removal of color from 2,000 ppm lignin solutions at 1,100,000 rad. Addition of 60 millimoles of propyl alcohol increased color removal to 67%, compared to 33% for non-alcoholic solutions. Oxygen-saturated solutions exhibited the greatest reduction in total organic carbon and generated the largest quantity of carbon dioxide. The pH of oxygenated solutions decreased sharply with doses up to 1,100,000 rad, but gradually increased above 2,000,000 rad; this phenomenon was attributed to the oxidation of organic acids. (Lisk-FIRL)
W79-00164

WASTE WATER TREATMENT AND RE-USE WITHIN THE TEXTILE INDUSTRY,
M. T. Turner.
Water Services, Vol. 82, No. 990, p 527-528, August, 1978. 2 fig, 5 tab.

Descriptors: *Textiles, *Color, *Flocculation, *Coagulation, *Flotation, Dyes, Chemical oxygen demand, Water reuse, Lime, Polyelectrolytes, Settling basins, Turbidity, Waste water treatment, Industry.

Aluminum sulfate flocculation and dissolved air flotation were selected by a textile mill in North Lancashire, England, for recycling processing effluents. The colored effluent, flowing at a rate of 79.5 cu m/hr, contained about 2,566 mg COD/liter; reductions to 250 mg COD/liter were necessary for reuse. Aluminum sulfate was selected as a flocculant over ferric and ferrous sulfate because of its lower dosage requirements. Effluent is held in a flow balancing tank/sump for 45 min before it is transported by a submerged centrifugal pump to the flocculation tank. About 250 mg/liter of a 7.5% aluminum sulfate solution and 150 mg/liter of a lime slurry are added to the effluent which is retained in the tank for 15 min. About 1 mg/liter of polyelectrolyte is added to the flocculated effluent as it flows by gravity to the dissolved air flotation cell. The flotation cell has a central diffusion drum, a bottom subnatant collection system, and an ejector to dissolve the air into the effluent stream. A flight scraper removes floating material which is discarded; subnatant passes through a turbidimeter prior to lagooning for reuse. Costs for recycling the treated effluent are about 25% of those for discharging raw sewage. (Lisk-FIRL)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 523, Price codes: A04 in paper copy, A01 in microfiche. Report No EPA-600/2-78-143, July 1978. 46 p, 9 fig, 6 tab, 10 ref, 3 append. R-802390.

Descriptors: *Water pollution treatment, *Waste water treatment, *Acid streams, *Iron oxides, *Crystallization, *Ferric oxide, *Iron removal, *Hydrolysis, *Chemical precipitation, Water purification, Sulfuric acid, Copper, Iron compounds, Copper leach solutions, Industrial wastes.

A bench-scale procedure which uses a retained solids crystallization process to increase the iron removal rate from acidic process liquors is described. This increased removal rate with retained solids results in lower solution concentrations of iron. The solid product formed is called alpha hematite (Fe203) and is suitable for iron smelting. At the same time, sulfuric acid is regenerated for recycling to the leaching process. This process provides high yield iron removal under less severe conditions than those required for present continuous crystallization technology. A 2-gallon continuous pressurized reactor was built, capable of processing free acid and ferric iron concentrations up to 20 and 30 g/l, respectively, at temperatures of 135C to 165C. Ferrous iron was oxidized to ferric by overpressure of oxygen and oxidation rates were enhanced by oxygen sparging. The iron oxide was contaminated with a small amount of sulfate ion, but was practically free of other metal ions. (Majtenyi-IPA)

criptors: *Waste water treatment, *Water pol-n, *Industrial wastes, *Activated sludge, ver plants, *Sludge treatment, *Filtration, vent extraction, *Ozone, *Odor, *Froth flota- Leachates, Ionizing radiation, Tertiary treat-t, Controls, Ion exchange, Mathematical els, Cost-benefit analysis, Management.

collection of 36 papers on the subject of r treatment focuses on areas such as toxic erials control, biological treatment, electric er generating plant waste water treatment, ical chemical processes, destruction of con-nants, disinfection and odor control, and air tion. Toxic materials control covers such sub-as monitoring toxic spills, biological effects xic materials, and safety aspects, and control treatment of toxic substances. Biological e water treatment deals with: activated sludge ods; ion exchange/adsorption models in rela-to virus transport in percolating beds; and ter- alum-mud precipitation. Electric power rating plant waste water treatment covers es from fossil-fueled plants, recovery of dium originating as impurities in oil, dewater-of sludges, ash disposal, land application of le plant wastes, and whey application on far-d. Physical chemical processes includes: lopments in oil interception by filtration, pH rol using carbon dioxide, solvent extraction, staged ultrafiltration. Ozone technology is esented with papers on pretreatment of indus-wastes, comparison of ozone and ultraviolet ation for oxidation of waste waters and disin-on, and destruction of toxic compounds by ing radiation. Disinfection and odor control ides papers on on-site generation of chlorite solutions by electrolysis of seawater, odor problems. Also included are papers on in-d air flotation performance, sorption capabili-of various materials for treating leachates, and val of fluoborate from electroplating wastes. UNOX PROCESS: EFFECTIVE WASTE-TER TREATMENT PRACTICE,
n Carbide Corp., South Charleston, WV.
. Vaseleski.
ilable from Copyright Clearance Center, Inc., York, NY as 0065-8812-78-9770-0178 ($0.95). Water -- 1977, AIChE Symposium Series, Vol. No. 178, edited by G. F. Bennett, p 23-28, 1978, 3 tab, 12 ref.

criptors: *Activated sludge, *Waste water ment, *Water purification, *Water pollution ment, *UNOX, *Oxygenation, Biological ment, Microbial degradation, Sludge, roorganisms, Aerobic bacteria, Aerobic condi-, Biological oxygen demand.

UNOX process is described as an improve-t on the currently accepted system of supply-microorganisms with oxygen during the activated sludge process for waste water purification. Instead of adding air to supply dissolved oxygen, UNOX uses high purity oxygen. As in other activated sludge systems, UNOX is composed of a biological reactor and a sedimentation tank. The biological reactor is divided into completely mixed stages by interior walls and is completely covered to provide a gas-tight enclosure. Liquid and gas phases flow concurrently through the reactor. Waste water, oxygen, and recycled sludge enter the first stage; however, oxygen enters at a slight pressure of 1-4 inches water column gage and flows from stage to stage with enough velocity to prevent backmixing. Because oxygen demand decreases as waste water progresses through the reactor, the net flow rate of gas is determined by the rate of gas mass transfer at each stage. An advantage of the system is that the high liquid phase dissolved oxygen provides a healthier biomass, which in turn, makes possible smaller tankage, smaller clarifiers, smaller dewatering equipment, and lower disposal costs. In addition, peak versus average load design is possible because the system can be allowed to drop to a dissolved oxygen of 2-3 during peak loading and/or oxygen feed can be increased. Such options do not exist with an air system. (See also W79-00342) (Majtenyi-IPA)

COMPARISON OF COMPLETE MIXED ACTIVATED SLUDGE AND UNOX TREATMENT OF BREWERY WASTES,
Flood and Associates, Inc., Jacksonville, FL.
B. A. Bell, and J. M. Welday.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9550-0178 ($1.05). In: Water -- 1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 29-36, 1978, 8 fig, 2 tab, 4 ref.

Descriptors: *Activated sludge, *Waste water treatment, *UNOX, *Oxygenation, *Waste treatment, *Water pollution treatment, Effluents, Aeration, Microbial degradation, Sludge, Aerobic bacteria, Biological oxygen demand, Wastes, Biological treatment, Brewery wastes.

A waste water treatment plant in Jacksonville, Florida, was the site of a study comparing the mixed activated sludge process and UNOX treatments of wastes. Although some results are described concerning the plant's original contact stabilization process, most interesting findings are those obtained during 1974 and 1975 when the plant was operated using the air-fed activated sludge process and 1975 to 1977 when it was operated using oxygen-free UNOX process. Major waste materials handled by this plant (Sewer District 2 Wastewater Treatment Plant) is brewery effluent which is high in suspended solids and 5-day biological demand (BOD5). The UNOX system proved superior for treating both types of pollutants. UNOX was able to average over 90% suspended solids removal compared to about 65% for the air fed activated sludge system. For the BOD5 removal, UNOX achieved 97.5% removal efficiency while the activated sludge process was about 53%. It is noted that these superior results were obtained at a time when the influent quality worsened; thus, it is concluded that UNOX pure oxygen process is better suited to handling characteristic brewery wastes. UNOX WASTEWATER TREATMENT SYSTEM PERFORMANCE SILICONE CHEMICAL COMPLEX,
Union Carbide Corp., Sistersville, WV.
R. A. Burton.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9875-0178 ($1.05). In: Water -- 1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 37-47, 1978, 11 fig.

Descriptors: *Activated sludge, *Waste water treatment, *Silicones, *Chemical wastes, *UNOX, Biological treatment, Aeration, Biological oxygen demand, Microbial degradation, Sludge, Separation techniques, Copper, Molds, Neutralization, Effluents, Oxygenation, Biological treatment, Alcohols, Ohio River.

The design, operation, and efficiency of the UNOX waste water treatment system at Union Carbide's Sisterville, West Virginia, Silicone Chemical Plant are discussed. The major contaminants of the plant are alcohols, toluene, metals, and some silicone oils. The treatment system design includes primary clarification with pH control and secondary treatment consisting of equalization, nutrient addition, holding basin, sludge drying/holding ponds, and two circular UNOX reactors, capable of 92% removal of biological oxygen demand (BOD). Problems that had to be solved included the clarifier recycle system, which initially was a floating bridge type mechanism. When this proved unreliable, a moving boom with hard rubber-covered metal wheels was installed which has functioned successfully. Other problems involved a high copper influent level, which was solved using a copper removal system before further processing, and low winter temperatures which were corrected by adding a rotary kiln. Also, a problem involving high levels of filamentous fungi was eliminated by increasing the sludge age and the food to microorganism ratio. Safety is maintained by careful monitoring of the reactors to detect any accumulation of combustible gas and incorporation of automatic failsafe devices. (See also W79-00342) (Majtenyi-IPA)

DESIGNING AND OPERATING AN OXYGEN ACTIVATED SLUDGE SYSTEM INCLUDING TERTIARY ALUM-MUD PRECIPITATION,
Gulf States Paper Corp., Tuscaloosa, AL.
R. R. Fuller, and D. W. Gilbert.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9661-0178 ($1.25). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. /Bennett, p 48-65, 1978, 6 fig, 6 tab, 3 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Organic wastes, *Industrial wastes, *Pulp wastes, *Alum-mud precipitation, Suspended solids, Biological treatment, Sludge, Effluents, Oxygenation, Sludge disposal, Drying, Incineration, Recycling, Dewatering, Biological oxygen demand, UNOX, Waste disposal, Pulp and paper industry.

Design of a waste disposal system for a pulp-paper complex located on a river with poor summer flow is described. The system required a special tertiary alum-mud precipitation in addition to conventional installations. The primary treatment includes a clarifier which removes 90% solids and 15% 5-day biological oxygen demand (BOD5) releasing an effluent containing 37 mg/l total suspended solids (TSS). Secondary treatment involves three UNOX oxygen activated sludge units, each of which has a throughput capacity of 10.67 million l/day. The average reduction across the secondary system is 86% when excessive loads are applied; thus, the tertiary clarifier was designed for treatment after the secondary clarifier. In the tertiary system, residual organics, including color and suspended solids are precipitated with 'alum-mud.' Experiments determined the best filter cloth and maximum open area for best hydraulic conditions. Dried cakes from the filter press are incinerated in a six hearth furnace. Ash from the furnace then passes to acid-brick lines reactor tanks where it is treated with sulfuric acid to convert aluminum oxide in the ash back to alum. It is concluded that precipitation systems, such as the alum-mud system, may be valuable for other industries, other than the paper industry, which have problems controlling loads of organics and suspended solids. Costs of construction and opera-

tion, and operating conditions and performance over a 2-year period are tabulated. Diagrams of the treatment system are supplied. (See also W79-00342) (Majtenyi-IPA)

EFFECTS OF DISSOLVED OXYGEN IN THE OXYGENATION ACTIVATED SLUDGE PROCESS,
NUS Corp., Houston, TX.
J. M. D'Antoni, and S. E. Steimle.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9823-0178 ($0.95). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 66-74, 1978, 9 fig, 2 tab, 10 ref.

Descriptors: *Oxygen, *Dissolved oxygen, *Activated sludge, *Waste water treatment, *Oxygenation, Sludge, Benefits, Biological treatment, Waste water, Laboratory tests, Suspended solids, Organic loading.

The benefits of using dissolved oxygen in the oxygenation activated sludge process were studied using a laboratory pilot system especially developed for the purpose. A unit module reactor system was designed and constructed based on the UNOX process and a synthetic powdered-milk based synthetic waste water was used for the study. Test runs were carried out using various suspended solids concentrations and normal dissolved oxygen concentrations and then elevated oxygen concentrations. Resuls showed that more rapid and intense metabolic reaction of viable organisms developed under elevated oxygen conditions. Next five operational parameters were chosen as practical indicators of performance: substrate removal rate, sludge yield, total oxygen consumed, sludge volume index, and sludge settling velocity. Results, using these parameters, are tabulated for both batch treatment and continuous flow studies and it is concluded that there were marked differences in the activated sludge process caused by increased dissolved oxygen levels. These include improved substrate removal rates and sludge settling with reduced oxygen consumption and sludge yields. With increased organic and solids loadings, the benefits become more apparent, a point to be considered in designing new or upgrading existing facilities. Utilization of pure oxygen in the oxygenation process provides the ability to carry elevated levels of mixed liquor solids without developing oxygen limited conditions and eliminates possible oxygen stagnation. A mathematical model for simulation of transient hydraulic peaks in the two-step oxygen activated sludge process is described as part of planning for a new waste water treatment plant in Houston, Texas. The model used describes one treatment train and includes both steps of the two-step process. It was developed based on mass and flow balances around each stage of the reactors and each of the clarifiers. The computer was used to perform several integrations simultaneously as required in the model. A sinusoidal flow pattern was used to simulate the diurnal variations in the incoming waste water and the simulation was conducted for a 48-hour period. Variations, such as peak wet weather characteristics and control actions for distribution of sludge, were programmed into the model. Results of computer simulation are recorded graphically. Design of the clarifier was aided by this study, especially such features as the ability to withdraw sludge from clarifiers, to control sludge blanket level, and to include sufficient depth to accommodate additional sludge mass resulting from abrupt flow rate increases. Also, it was demonstrated that gross process failure can occur as a result of a peak hydraulic surge through the plant. To solve this problem transfer of excess sludge to an adjoining train is recommended. (See also W79-00342) (Majtenyi-IPA)

Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9469-0178 ($1.15). In: Water -- 1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 84-92, 1978, 8 fig, 2 tab, 17 ref.

Descriptors: *Mathematical models, *Waste water, *Percolation, *Ion exchange, *Viruses, Leachate, Activated carbon, Packed beds, Sewage, Water treatment, Soil water movement, Groundwater, Percolating water, Sludge treatment, Silts, Septic tanks, Ion exchange/adsorption equaions, Adsorption, Elution, Equilibrium.

Experimental and mathematical models are described for predicting breakthrough of low levels of virus from percolating columns. This research is aimed at developing better methods of predicting the magnitude of the threat of virus contamination of groundwater supplies by percolation from such sources as surface spreading of untreated and treated waste water, sludge land spreading, septic tanks, and landfill leachates. It included models for both adsorption (application of waste water to an uncontaminated bed) and elution (application of clean water to contaminated beds). The percolation/adsorption model consisted of a virus mass balance, an adsorption rate, and an equilibrium isotherm relationship. The data were obtained by measuring the equilibrium uptake of T4-phage from electrolyte solutions of known initial virus concentrations by known masses of activated carbon. The virus breakthrough is described by ion exchange/adsorption equations and the effects of external mass transfer and nonlinear adsorption isotherms are included. The predicted values obtained from the model experiments agree qualitatively with experiments carried out on virus transport through laboratory columns of silty soils or activated carbon. OXYGEN ACTIVATED SLUDGE CONSIDERATIONS FOR INDUSTRIAL APPLICATIONS,
AWARE, Inc., Nashville, TN.
C. E. Adams, Jr., W. W. Eckenfelder, Jr., J. H. Koon, and S. E. Shelby.
Available from Copyright Center, Inc., New York, NY as 0065-8812-78-9754-0178 ($0.95). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 93-101, 1978, 9 fig, 6 ref.

Descriptors: *Activated sludge, *Waste water treatment, *Industrial waste, *Oxygenation, *Biological treatment, *Evaluation, Waste treatment, Aeration, Hydrogen ion concentration, Organic compounds, Sludge, Suspended solids, Economics, Costs, Appraisals, Installation costs, Operating costs, Odor.

A number of factors are discussed which must be evaluated when assessing the relative merits of air oxygenated versus pure oxygen oxygenated activated sludge systems for industrial use. Organic removal kinetics may play a more important role in treating industrial wastes than municipal wastes because of their high strength. It is shown that a higher dissolved oxygen level in the aeration basin will result in a higher resistance to organic shock loadings and a more aerobic floc. A higher temperature because of the enclosure of the aeration basin is an advantage of the pure oxygen system, especially in cold climates. Equilibrium of the aeration basin pH can be a problem with the pure oxygen system because it intails a slightly lower pH. With highly acidic industrial waste waters it may be difficult to maintain pH to an acceptable range between 6.5 and 7.5. Also, the enclosed oxygen system may result in difficulties by retaining volatile organics which can inhibit the system. Pure oxygen systems are preferable to air oxygen systems for control of odors and susceptibility to shock loadings. Another factor to be considered is mixed liquor volatile suspended solids concentrations which can be handled effectively by both systems if they are properly designed; however the pure oxygen system does have the advantage of being able to supply sufficient oxygen to maintain relatively high mixed liquor or solids levels without requiring use of high power levels which would promote break-up of floc particles. Economically, a pure oxygen system costs more to construct but may offer substantial savings in operating costs, based mostly on the power requirements to achieve the necessary dissolved oxygen concentration. TREATMENT OF LIQUID WASTES FROM FOSSIL FUEL POWER PLANTS,
Ecodyne Corp., Union, NJ. Industrial Waste Treatment Div.
J. E. Brenman.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9047 ($0.75). In: Water -- 1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 102-108, 1978, 4 fig, 5 tab.

Descriptors: *Liquid wastes, *Power plants, *Fossil fuels, *Waste treatment, *Coals, Sulfur compounds, Runoff, Suspended solids, Fly ash, Heavy metals, Oil wastes, Industrial wastes, BPCTCA, BATEA, Standards, Water quality, Cleaning.

Six major sources of pollution from fossil fuel power plants are discussed in relation to methods appropriate for achieving the standards described for such facilities by the Environmental Protection Agency (EPA). Recommendations are given in each category on how to meet the 'Best Practicable Control Technology Currently Available' (BPCTCA) by July 1, 1977 and 'Best Available Technology Economically Achievable' (BATEA) by July 1, 1983. The six pollution sources discussed are: maintenance cleaning waste, stack gas sulfur dioxide removal, coal pile and miscellaneous area run-off, fly ash treatment, bottom ash, and sanitary waste. The substances found to be of major concern are suspended solids, oil and grease, and heavy metals. Removal of these substances is discussed under each category with ultimate efficiency to be dictated by the specific conditions of its generation. The BPCTCA and BATEA guidelines are tabulated and some specific recommendations to achieve them are made and estimated efficiency is summarized. (See also W79-00342) (Majtenyi-IPA)

DESIGN CONSIDERATIONS FOR WASTE-WATER TREATMENT SYSTEMS AT EXISTING FOSSIL POWER PLANTS,
Stone and Webster Engineering Corp., Boston, MA.
B. E. Dudzik.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-1703-0178 ($1.35). In: Water -- 1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 130-139, 1978.

Descriptors: *Waste water treatment, *Power plants, *Design, *Fossil fuels, Sedimentation, Neutralization, Dewatering, Sludge, Waste water, Industrial wastes, Fly ash, Evaluation, Cost analysis, Pumps, Coal, Demineralization, Separation techniques.

Several alternatives for treatment of waste waters produced by fossil-fueled power plants are described for each of several waste sources. Floor and equipment drainage usually must be treated separately because of extensive chemical and/or physical processes required for most other wastes. Corrugated plant interceptors and corrugated plant separators are useful for removing suspended solids and save space over conventional separators. Specific recommendations are made for handling floor and equipment drainage wastes and results show flow rates from this source can be reduced by 75%. Suggestions are made for improving handling of water treatment system wastes including demineralizer wastes which may involve acid or caustic feed through a flow-through pH sensor. Equipment washing wastes cover those produced by removal of ash from equipment such as air preheaters, economizer, boiler firesides, and precipitator hoppers. Most effective methods of treating such wastes are: (1) adding dry high calcium quicklime and polyelectrolyte into a mixed tank or sump with about a 15-minute detention time and effluent pH of 9.0; (2) gravity sedimentation of solids produced from the lime addition; (3) final neutralization of resulting overflow to a pH suitable for direct discharge; (4) dewatering of collected sludge from gravity sedimentation. Each of these methods is analyzed with respect to space requirements, cost, and operating problems. Ash handling systems wastes discussed include oil fly ash and coal bottom ash. Bottom ash, in turn, is divided into slagging and non-slagging ash which require different treatments. (See also W79-00342) (Majtenyi-IPA)

WASTE TREATMENT FOR A PROFIT,
Long Island Lighting Co., Glenwood Landing, NY.
P. P. LaLena.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9080-0178 ($1.25). In: Water -- 1977, AIChE, Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 140-148, 1978, 8 fig, 2 tab, 10 ref.

Descriptors: *Waste treatment, *Power plants, *Recycling, *Vanadium, Oxidation, Reduction, Hydrogen ion concentration, Acidification, Lime, Filtration, Long Island Lighting Co.(LILCO), Ferrovanadate, Industrial wastes, Oil, Pilot plants.

Recovery of valuable vanadium originating as impurities in the Venezuelan fuel oil burned at power plants of the Long Island Lighting Company (LILCO) is described. Each barrel of oil burned contains 0.2 pounds of vanadium oxide (V_2O_5), making a total of 2.75 million pounds of vanadium consumed each year. Vanadium salts and oxides in the ash exist in various forms including V+4, V+5, metavanadate (VO-3), and orthovanadate (VO4-3) but when combined in furnace wash water, all forms tend to oxidize to the +5 state which is extremely water soluble. Original recovery efforts involved lime treatment, solids separation, and carbon removal in a fluidized bed combustor; however, in 1975, laboratory studies were begun to determine optimum recovery methods. These tests indicated that treatment with ferrous sulfate ($FeSO_4$) to reduce V+5 to ferrous vanadate ($Fe(VO_3)_2$) and subsequent pH adjustment to 9.5 with lime was an efficient method. Pilot plant studies confirmed this finding and determined more precise operating conditions. Now full scale treatment facilities are being constructed for two power stations of LILCO burning the high vanadium content oil at a cost of $11 million. On completion in late 1979, the additional annual income from sales of the recovered vanadium is expected to be $700,000. The filter cake to be produced will contain an iron-to-vanadium ratio of 0.25 to 0.30, and studies are underway on direct conversion to ferrovanadate (FeV) using reduction in plasma arc furnace. Potential for sales of FeV are estimated at $6 million a year. (See also W79-00342) (Majtenyi-IPA)

Descriptors: *Waste water treatment, *Sludge, *Chemical precipitation, *Power plants, Industrial wastes, Sludge disposal, Vacuum filtration, Filter press, Dewatering, Lime, Caustic, Cost analysis, Pilot plants, Cost-benefit analysis, Laboratory tests, Electric power industry, Copper, Iron.

The results of laboratory and pilot plant studies on sludges generated by oil-fired electric power generating plants are discussed as a guide to selecting a chemical precipitant for pollutant removal. The goal in treating waste water streams is to produce as low a volume of sludge as possible. In waste streams containing copper and iron, these metals are removed by chemical precipitation involving pH elevation using either caustic (sodium hydroxide) or lime (calcium oxide). Five considerations for choice of precipitant are discussed: chemical costs; storage, handling, and feed; quantity of sludge produced; size of waste water treatment equipment; and sludge dewatering ability. Although dry weights of copper and iron in sludge are approximately the same for either caustic or lime treatment, more carbonates and bicarbonates precipitate with lime than caustic; thus, more sludge is produced. However, the sludge produced by lime has the advantage of being more readily dewatered. Based on empirical data, vacuum filters and filter press are the two processes for dewatering lime and caustic sludges deemed cost effective. Conditions favoring choice of which method to use are described. For example, high proportions of chemical cleaning solutions favor filter press dewatering but large amounts of fly ash favor vacuum filtration. (See also W79-00342) (Majtenyi-IPA)

Descriptors: *Waste water treatment, *Industrial waste, *Oily waste, *Filtration, *Multimedia deep bed filtration(MMDB), Alum, Ferric chloride, Coagulation, Costs, Separation techniques, Suspended solids, Oil industry.

Use of multimedia deep bed filration (MMDB) technology is described for both secondary and tertiary treatment of oily waste waters of the petroleum industry. The process consists of removing suspended solids by straining through a deep filter bed of anthracite and sand. It was found that applying and mixing the right combinations of chemicals and/or polymetrs immediately ahead of the filter resulted in up to 90% removal of suspended solids. A typical MMDB operates at flux rates between 10-16 gpm/sf and uses a 3-5 ft bed of anthracite over a 2-3 ft bed of sand supported by 1 ft of gravel. Contact coagulation takes place within the bed when chemicals, such as ferric chloride and alum are added. There are a wide variety of applications for MMDB in treating oily waste waters from refineries, oil terminals, and oil fields, including; drainage and storm runoff water, ballast water, brines prior to injection into an oil field, and sea water, to condition it for injection into oil bearing formations. Capital costs of MMDB filters are discussed for plants in the 2.5 to 50 mgd range. Total costs of operation are covered, including energy, land area requirements, and chemical costs. Descriptors: *Waste water treatment, *Hydrogen ion concentration, *Carbon dioxide, Neutralization, Acid effluents, Sodium hydroxide, Thiems equation, Acid-base equilibrium, Alkaline effluents, Equations.

Carbon dioxide (CO_2) can effectively replace sulfuric acid (H_2SO_4) for acidifying alkaline effluents. Using CO_2 is very efficient for lowering pH to 8.0 but inefficient below pH 8.0 because of the buffering effect of bicarbonates formed during treatment. Alkaline effluents can be treated directly with CO_2 but acidic effluents are candidates for using CO_2 also, if they are first made alkaline by adding sodium hydroxide. Then pH can be adjusted accurately using CO_2. The simplest method of CO_2 addition is to introduce the gas through an open-end standpipe at the bottom of the tank, a perforated pipe, or a perforated plate at the bottom of the tank. Theoretical CO_2 consumption is discussed using equilibrium equations both above and below pH 8. Examples illustrating calculations are included. (See also W79-00342) (Majtenyi-IPA)

SOLVENT EXTRACTION FOR TREATMENT OF WASTEWATERS FROM ACETIC-ACID MANUFACTURE,
California Univ., Berkeley.
N. L. Ricker, and C. J. King.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9624-0178 ($1.75). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 204-209, 1978, 3 tab, 14 ref.

Descriptors: *Waste water treatment, *Solvent extraction, *Acetic acid, Industrial wastes, Costs, Cost effectiveness, Recycling, Waste water, Pollutant identification, Solvents, Organic chemicals, Chemical oxygen demand(COD).

Waste waters from acetic acid plants can be treated successfully using the solvent extraction system; however, before determining what solvent or solvents to use, the composition of waste water must be examined to detect major pollutants. Commonly, these consist of formic and acetic acids, low molecular weight alcohols and aldehydes and have chemical oxygen demand between 5800 and 27,000. Once composition is known, the solvent can be chosen based on such criteria as: distribution coefficient for solutes to be removed, reactivity, ease of separability, low aqueous solubility, density, viscosity, and cost. Special problems are encountered with wastes containing organic acids and chlorinated acetaldehydes either because of complex formation or separation difficulties. Some promising solvents are discussed including 2-ethylhexanol and 50% cyclohexanone 50% 2-ethyl hexanol. In general, costs of extraction are high compared with biological oxidation processes but on the basis of recovered acetic acid, the solvent extraction process can be economical. MOLECULAR FRACTIONATION BY STAGED ULTRAFILTRATION,
Millipore Corp., Bedford, MA.
R. S. Tutunjian, and A. R. Reti.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9143-0178 ($0.95). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 210-216, 1978, 9 fig, 1 tab.

Descriptors: *Filtration, *Membrane processes, *Waste water purification, *Molecular fractionation, Mathematical models, Waste water, Staged ultrafiltration, Separation techniques, Water treatment.

Ultrafiltration is a process which separates substances on the basis of their molecular size using membranes. It can be applied to industrial processes, such as virus control, cheese whey purification, colloid removal, and water treatment. The separation potential for a single membrane is such that it allows free passage only to substances which are 1/5 to 1/10 of the molelcular weight of the substances which it retains. Thus, good separation of molecules is impossible with one membrane. However, using several membranes staged in cascade fashion, separation of molecules having very similar sizes is possible. Using mathematical model techniques, a general solution was derived. It was demonstrated that, as the number of stages is increased, relative separation is increased. Experiments were carried out to examine some of the theoretical predictions and good correlation was observed. (See also W79-00342) (Majtenyi-IPA)
W79-00367

PRETREATMENT OF INDUSTRIAL WASTES WITH OZONE,
Gulf South Research Inst., New Orleans, LA.
F. H. Yocum, J. H. Mayes, and W. A. Myers.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9113-0178 ($0.95). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 217-227, 1978, 12 fig, 7 tab, 12 ref.

Descriptors: *Waste water treatment, *Ozone, *Industrial wastes, *Oxidation, Mathematical models, Hydrogen ion concentration, Chemical reactions, Total organic carbon, Styrene, Ethylene glycol, Ethylene diamine, Toluene diisocyanate, Chlorine, Chlorides, Water pollution treatment, Biodegradation, Chemical industry.

Ozonation for treatment of biorefractory or har to oxidize compounds was investigated and foun to be effective. The experimental procedure i volved a stirred tank reactor and ozone was fe continuously at a rate of 11.5 l/m into a consta volume of waste water. An average test continue for 3 hours and samples were analyzed for total o ganic carbon (TOC). Also, mass transfer tes were done to evaluate the reactor characteristi and to correlate volumetric mass transfer coeff cient with power input and gas velocity. A math matical model was developed to evaluate the vol metric mass transfer coefficient for ozone transf into distilled water. Also, experiments were ca ried out at various temperatures and pH valu using four types of industrial waste waters: (waste from toluene diisocyanate process, co taminated with toluene, amines, and toluei diamine; (2) waste from an ethylene glycol plar containing ethyl glycol and other polyol co pounds; (3) styrene process waste water, contai ing styrene monomer; and (4) waste from ethylene diamine plant with high chloride a residual chlorine content. Results indicate th ozonation improved biodegradability of all fo wastes. Also, oxidation was increased at p values above 10 except for the toluene waste. Co of ozonation is admittedly prohibitive for mo requirements but may be acceptible if standar are made more stringent. (See also W79-0034 (Majtenyi-IPA)

NEW TECHNOLOGY: OZONE/UV CHEMICA OXIDATION WASTEWATER PROCESS FO METAL COMPLEXES, ORGANIC SPECI AND DISINFECTION,
Houston Research, Inc., TX.
H. W. Prengle, Jr., and C. E. Mauk.
Available from Copyright Clearance Center, In New York, NY as 0065-8812-78-9110-0178 ($1.4 In: Water--1977, AIChE Symposium Series, V 74, No. 178, edited by G. F. Bennett, p 228-2 1978, 15 fig, 7 tab, 9 ref.

Descriptors: *Waste water treatment, *Ozo *Ultraviolet radiation, *Disinfection, Inorga compounds, Organic compounds, Metals, Oxi tion, Refractory compounds, Waste water puri cation, Water pollution treatment, Total orga carbon(TOC), Refractivity, Gas chromatograph

Chemical oxidation of waste water using ozo can be augmented by ultraviolet (UV) light tre ment. The combined ozone-UV process, kno commercially as oxyphotolysis, was developed use on organic and inorganic materials as well for disinfection. Before actual studies were begu reactivity of refractory species were characteriz using a refractory index, UV spectrograms, a molecular structure analysis. Oxidation rate s dies were carried out on over 30 pure compoun and 15 composite industrial wastes and reactio were followed using gas chromatography, total ganic carbon (TOC) analysis, and pH measu ments to follow destruction of organic aci Sulfate and phosphate analyses were used to vestigate fate of sulfur and phosphorus, and t bimetric chloride analysis was done to determi whether chlorine went to chloride or some oth form. It was concluded that oxyphotolysis is eff tive for destruction of toxic or biorefractory pol tants. Metallic cyanides were destroyed comple ly, even the extremely stable iron cyanides. Re tivity and reaction rates correlated directly w UV absorption data; aromatic compounds abs more UV than aliphatics and are more reacti Reactions are driven to completion by UV ene input and the appropriate amount and frequen Oxyphotosis proved more effective for disinf tion than either ozone or UV separately and amount of ozone required is only 10% of dosage needed when ozone is used alone. DESTRUCTION OF TRACE TOXIC COMPOUNDS IN WATER AND SLUDGE BY IONIZING RADIATION,
Massachusetts Inst. of Tech. Cambridge.
E. W. Merrill, D. R. Mabry, R. B. Schulz, W. D. Coleman, and J. G. Trump.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9446-0174 ($0.75). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 245-250, 1978. 9 fig, 2 tab, 4 ref.

Descriptors: *Toxicity, *Waste water treatment, *Ionizing radiation, *Polychlorinated biphenyls, Sludge treatment, Sludge, Industrial wastes, Herbicides, Water pollution, Organic compounds, High pressure liquid chromatography(HPLC), Ultraviolet radiation.

Traces of toxic compounds, such as the herbicide monuron and two polychlorinated biphenyls (PCBs), 3,4,2-trichlorobiphenyl and 4 chlorobiphenyl, were successfully destroyed by ionizing radiation. Samples were irradiated using a 3 million electron volt Van de Graaff generator and results were analyzed using high pressure liquid chromatography (HPLC) anf ultraviolet (UV) spectra. Using simple aqueous solutions of monuron, over 96% of the LC peak disappeared after a radiation dose of 10 kilorads. To simulate actual sludge conditions, the PCBs were dissolved in soap solutions and extracted with hexane before irradiation. Results were followed using HPLC and, as with monuron, destruction was rapid as shown by disappearance of the peak corresponding to the parent PCB. In addition, the appearance of degradation peaks earlier in the chromatogram indicated the creation of substances more soluble than the parent compound, probably hydroxylated compounds. It is hypothesized that, in water, hydroxyl radical attack on the PCB and monuron is the principal mode of degradation and that doses of 10 kilorads would remove most of such contaminants. CHARACTERIZATION OF PERFORMANCE OF FULL-SCALE TERTIARY WASTEWATER GRANULAR MEDIA FILTERS,
Northwestern Univ., Evanston, IL.
J. A. FitzPatrick, and C. L. Swanson.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-1089-0178 ($1.15). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 251-264, 1978, 13 fig, 4 tab, 8 ref.

Descriptors: *Waste water treatment, *Filtration, *Municipal wastes, *Tertiary treatment, *Sewage, Mathematical models, Suspended solids, Turbidity, Biological oxygen demand(BOD), Chicago, Granular media filters, Flocculation, Particle size, Evaluation, Sampling.

Evaluation studies were carried out on 8 small tertiary granular filtration plants in the Chicago area. Performance on such filters depends on such variables as media type, size, and depth, filtration rate, influent suspended solid concentration, influent particle size distribution, type of secondary process, and flocculation characteristics of solids. The study began by characterizing performance as a function of design and operational variables. Sampling was done at 24-hr intervals, with some shorter periods, and routinely analyzed for turbidity, suspended solids and biological oxygen demand (BOD). Based on the empirical data collected, a mathematical model was developed for filtration performance and tested against actual plant achievements. It was concluded that: total suspended solid removal efficiency is very strongly dependent on refiltration parameters; and if straining is the dominant particle collection mode, suspended solid removal efficiency is weakly dependent on filter media size and depth. WASTEWATER ODOR PROBLEM SOLVING -- PROCESS MODIFICATION VERSUS AIR TREATMENT,
Research Corp. of New England, Wethersfield, CT.
R. E. Kenson, V. G. Boscak, and G. T. Brookman.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-1647-0178 ($0.85). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 270-277, 1978, 5 fig, 3 tab, 7 ref.

Descriptors: *Odor, *Waste water treatment, *Air pollution, *Contamination(Air), Costs, Cost-benefit analysis, Pollutant identification, Evaluation, Performance.

Process modification is compared with air treatment as a preferred method of solving waste water odor problems. It is concluded that both methods can be cost effective if all the costs, both capital and operational, are considered, and all technically feasible solutions are examined before implementation. The following plan is recommended for solving such odor problems: (1) evaluation of odor emissions from both stack and open sources and their impact on ambient odors; (2) an engineering evaluation of alternate solutions including energy availability and costs; (3) design and construction of the chosen solution after review of each feasible control pros/cons. Some of the engineering measurements and evaluation are illustrated by specific examples including case histories of how odor problems were solved. (See also W79-00342) (Majtenyi-IPA)

CONTROL OF NUISANCE ODORS FROM PONDS BY THE USE OF BACTERIA CULTURES,
Rohm and Haas Kentucky Inc., Louisville, KY.
R. A. Jensen.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9093-0178 ($0.75). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 278-282, 1978, 2 ref.

Descriptors: *Odor, *Waste water treatment, *Air pollution, *Biological treatment, *Bacteria, *Sulfur bacteria, Anaerobic bacteria, Formaldehyde, Dissolved oxygen, Contamination(Air), Stagnant water, Bacterial culture.

Bacterial cultures can be used to eliminate offensive odors generated by sulfur-reducing anaerobic bacteria in stagnant ponds. The development of a successful bacterial treatment is traced over a three-year period during which experiments were carried out at an odor-producing landfill basin containing water in Louisville, Kentucky. A number of methods were applied without success, including; aeration, formaldehyde as a bactericide, and hydrogen peroxide to increase dissolved oxygen. The successful bacterial culture method took advantage of the favorable neutral pH and long residence time. The odor-producing area was innoculated with 'DEC Plus' dried bacterial culture at a dosage of 1 lb per 100,000 to 200,000 lbs water. Even though the temperature was below the optimum performance temperature for the bacteria, it was thought that this culture was capable of overriding the sulfide-producing bacteria and converting the biological action into an odorless mode. This proved to be true and, later, it was established that increasing the frequency of bacteria addition to six times a day reduces the possibility of the broth losing strength before use. The most effective method is to distribute active broth over the full surface of the pond. (See also W79-00342) (Majtenyi-IPA)

FACTORS INFLUENCING INDUCED AIR FLOTATION,
Petrolite Corp., St. Louis, MO.
C. W. Burkhardt, J. V. Janes, III, and D. W. Griffiths.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-1068-0178 ($0.75). In: Water--1977, AIChE Symposium Series, Vol 74, No 178, edited by G. F. Bennett, p 283-289, 1978, 5 fig, 3 tab, 10 ref.

Descriptors: *Waste water treatment, *Flotation, *Oily wastes, *Polyelectrolytes, *Ionization, Industrial wastes, Reaction rate constants, Froth flotation, Waste identification, Oil-water interfaces, Oily water.

The use of materials, such as hydrolyzing metal salts and cationic polyelectrolytes, was shown to produce up to 40-fold acceleration of the induced air flotation process for clarifying oily wastes. Assuming that a flotation aid must first interact with individual oil droplets, the research approach was to relate performance of a flotation aid to its affinity for the oil/water interface. Experiments were done to investigate the influence of ionic strength on solution properties and performance as air flotation aids of two cationic polyelectrolytes, Polymer C-76 and Polymer C-20. Electrolyte properties were determined and their performance as flotation aids was measured. Studies using emulsions of crude oil and water showed that clarification followed first order kinetics. However, in the presence of polyelectrolytes, the first order rate constant was found to be a function of polyelectrolyte concentration. Complete performance profiles were developed for each polyelectrolyte at 6 concentrations ranging from 1-5 mg/l. The data confirmed that clarification rate is accelerated by polyelectrolytes and performance improves as ionic strength increases. It is concluded that it may be reasonable to consider natural ion strength before choosing an appropriate flotation process. (See also W79-00342) (Majtenyi-IPA)

CRITICAL ANALYSIS OF FLOTATION PERFORMANCE,
Petrolite Corp., St. Louis, MO. Tetrolite Div.
R. J. Churschill, and K. J. Tacchi.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-1067-0178 ($0.95). In: Water--1977, AIChE Symposium Series, Vol 74, No 178, edited by G. F. Bennett, p 290-299, 1978, 9 fig, 2 tab.

Descriptors: *Froth flotation, *Waste water treatment, *Flotation, *Comparative benefits, Industrial wastes, Dissolved gas flotation, Induced gas flotation, Water treatment, Performance, Evaluation.

Because air flotation is so widely applied and often is the only water treatment method used, an examination of the factors which affect process selection and performance was made. The two major methods currently in use, dissolved gas and induced gas, are described and some advantages of each are noted. Factors influencing flotation performance are identified as: (1) adhesion of bubble to a dispersed particle: (2) trapping of bubbles in a coagule or floc structure as the bubble rises; and (3) adsorption of bubbles into a coagule of floc as it forms. Considering these factors and the surface chemistry aspect of flotation, criteria for performance evaluation can be established. The dissolved gas and induced gas methods are discussed on this basis and some theoretical factors to be considered in designing such systems are described. Four specific examples using operating data from full scale flotation systems demonstrate that situations exist in which either process is ap-

plicable and will perform acceptably. (See also W79-00342) (Majtenyi-IPA)

SORPTION CAPABILITIES OF VARIOUS MATERIALS FOR LEACHATE TREATMENT,
New Jersey Inst. of Tech., Newark.
P. Chan, J. Liskowitz, A. J. Perna, M. Sheih, and R. Trattner.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9557-0178 ($1.15). In: Water--1977, AIChE Symposium Series, Vol 74, No 178, edited by G. F. Bennett, p 300-308, 1978, 4 fig, 6 tab, 6 ref.

Descriptors: *Waste water treatment, *Leachates, *Sorption, Sludge, Industrial waste, Lysimeter, Fly ash, Activated carbon, Zeolite, Kaolinite, Hydrogen ion concentration, Water treatment, Metals, Performance, Evaluation, Total organic carbon, Chemical oxygen demand, Landfills.

To evaluate performance of natural and synthetic sorbents for removing components present in leachates from industrial sludge landfills, a series of lysimeter experiments was carried out. The sorbents investigated included: basic and acidic fly ash, bottom ash, Ottawa sand, activated carbon, illite, kaolinite, vermiculite, natural zeolite, cullite, and three sizes of activated alumina. The moisture content of the sludge was assessed to determine how much water should be mixed with a particular sludge to attain maximum concentration of pollutants. Then, concentrations of sludge in distilled water were prepared to give a ratio of 2.5 ml water per gram of dried sludge. The mixtures were stirred 24 hrs, filtered, and used for lystimeter studies. Parameters chosen to evaluate performance were: pH, conduction, chemical oxygen demand (COD), and total organic carbon (TOC). Leachates from three types of industrial sludge were tested using the sorbents listed. Results indicated that no single sorbent could remove all objectionable ions from the leachates studied, but a number of them exhibited removal capacity and retainability under dynamic conditions. A variety of specialized capabilities were noted. In general, the behavior of a sorbent, as regards removal of a particular contaminant, varies with the type of leachate being treated. Also, pH of the leachate is one of the prime factors in determining the effectiveness of the system. (See also W79-00342) (Majtenyi-IPA)

REMOVAL OF FLUOBORATE FROM PLATING WASTEWATER: TECHNIQUE AND MECAHNISM,
New Jersey Inst. of Tech., Newark.
V. N. Cagnati, R. H. Haralson, T. A. Hunter, J. W. Liskowitz, and A. J. Perna.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-1648-0178 ($0.95). In: Water--1977, AIChE Symposium Series, Vol 74, No 178, edited by G. F. Bennett, p 309-315, 1978, 5 fig, 2 tab, 10 ref.

Descriptors: *Waste water treatment, *Flotation, *Ion flotation, *Fluoborate, Chemical reactions, Physical reactions, Surfactants, Foaming, Electrochemistry, Industrial wastes.

A technique for removal of fluoborate ion from waste waters of the electroplating industry is described and a reaction mechanism explained. Fluoborate, which is being substituted for other toxic ions in electroplating, is a tightly bound tetrahedral of four fluoride atoms symmetrically surrounding a centrally located boron atom. The diameter of this ion is only about 5A and this small size in addition to its symmetrical shape makes it more like an ionized single atom than a molecular ion. The removal process, called ion flotation, is a combination chemical-physical process in which a surfactant is added to the solution and the contaminant is foamed out of binding it so that it will be held when the surfactant is removed. A number of cationic surfactants were tested and found acceptable but two were chosen for use in actual flotation experiments, Armac-C (a 12-carbon Coco amine acetate) and Armac-T. Results indicated a maximum of 94% removal of fluoborate by Armax-T at the molar ratio of 3:5:1. Armac-C gave slightly lower removal percentages. The increase in removal capacity of Armac-T over Armac-C is attributed to the longer carbon chain of 18 atoms. The mechanism involves replacement of the acetate on the active site of the surfactant by fluoborate. (See also W79-00342) (Majtenyi-IPA)

A process is provided for purifying industrial effluents, particularly for decolorizing waste waters from the paper or textile industries. The process involves bringing the effluent into contact with an adsorbent prepared by precipitating a basic nitrogenous polymeric compound onto a carrier with an activated clay mineral. For example, the adsorbent can be prepared by using activated magnesium bentonite to precipitate a polyamidepolyamine (derived from polymerized linoleic acid/linolenic acid and triethylenetetramine) onto bleached pine sulfite cellulose as the carrier. The removal of carbon oxides during the production of ammonia with copper-ammonia solutions results in the accumulation of 5-20% ammonia, 0.1-0.2% copper, 2-4% carbon oxides, and 0.1-0.2% acetic acid in the effluents. A laboratory method was developed for treating copper-ammonia solutions with hydrolysis lignin in a solid/liquid ratio of 1:2 to 1:4. The product is then dried. Solutions treated in this fashion are completely free of copper. In addition, the product contains 99% organic material enriched with ammonium nitrogen and 0.1% copper, which is an important nutritional trace element. This material is used for producing a complex soil amendment for cotton plantations by additions of double superphosphate, urea, and urea-formaldehyde fertilizer. (Chern-IPC)

Descriptors: *Pulp wastes, *Bleaching wastes, *Insects, *Water pollution effects, Wastes, Industrial wastes, Pulp and paper industry, Water pollution sources, Pine trees, Birch trees, Waste water treatment, Neutralization, Lime, Activated sludge, Water pollution treatment, Toxicity, Detoxification, Dialysis, Solvent extractions, Ion exchange, Ultraviolet radiation, Inorganic compounds, Salts, Sodium compounds, Sodium chloride, Sodium carbonate, Termites, Aluminum sulfate, Kraft pulping, Wood extractives, Insecticides.

Filter-paper disks were impregnated with laboratory kraft pulping and bleaching wastes from Pinus densiflora or Betula platyphylla, dried overnight at room temperature (20-30C), and placed in petri dishes along with termites (50 workers plus 5 soldiers per dish). Termite mortality was determined at 24-hr intervals during incubation in the dark at 30C. All the wastes were toxic to the termites. Four conventional effluent treatments (neutralization, alum, lime, and activated sludge process) failed to remove the toxicity from the pine kraft pulping waste. Resuls of termite exposure tests after dialysis, solvent extraction, ion-exchange, and ultraviolet irradiation suggested that the main active substances in the bleaching wastes (except the chlorination stage) also appeared to be inorganic salts, notably sodium carbonate, sulfate, and chloride. This confirms the value of the ancient practice of wood protection by salt impregnation and the important effects of salts in seawater on marine organisms. (Brown-IPC)

M. Gahin, and T. Krause.

Das Papier, Vol. 32, No. 3, p 97-101, March, 1978. 5 fig, 2 illus, 9 ref, 1 tab. English summary.

Descriptors: *Bleaching wastes, *Waste water treatment, *Activated carbon, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Pulp and paper industry, Pulp wastes, Lignins, Sulfonates, Effluents, Filtration, Filters, Organic compounds, Carbohydrates, Chromatography, Inorganic compounds, Beech trees(Fagus), Sulfite pulp, Lignosulfonates.

The effluent from the last washing stage of an unbleached beech sulfite pulp was filtered through granulated activated carbon. The filtrates and the untreated effluent were analyzed for lignosulfonates, carbohydrates, and inorganic constituents. Molecular weight distribution of the lignosulfonates was determined by molecular sieve chromatography. Filtration on activated carbon is shown to reduce the solids content of such wash water to about 40% of the original value and to remove practically all lignosulfonates and carbohydrates. (Ward-IPC)

The operation of air-activated and high-purity oxygen-activated biological effluent treatment pilot plants were compared in an investigation conducted by the Alaska Lumber and Pulp Co. Inc. (Sitka, Alaska), EKONO Inc., and Howard Edde Inc., Consultant Engineers (Washington). The performance of the UNOX activated sludge treatment system was superior to that of the air-activated system for treating the magnesium-base sulfite dissolving-pulp mill's effluent. When treatment of the chlorination-stage effluent from the bleach plant was bypassed, the recommended oxygen-aeration tank process design loading was a food/microorganism ratio of 1.0 as compared with 0.6 for air-activated sludge while obtaning high 5-day BOD removal. Similarly, the oxygen system had an allowable clarifier process design mass loading of 44 lb/sq ft/day and 4% underflow solids consistency compared with 30 lb/sq ft/day and 1%, respectively, for the air-activated sludge. Also, the oxygen system exhibited greater process stability during shock loading and following startup after extended mill shutdowns. The effluent from both the air-activated sludge and UNOX system satisfied the bioassay for LC(20) and LC(50). The fuel value of the excess biological sludge from either pilot plant was about 9,400 BTU/lb (oven-dry basis). (Swichtenberg-IPC)

EPA'S GOAL FOR SUSPENDED SOLIDS IS NOT MET WITH MEDIA FILTRATION,
Procter and Gamble Co., Cincinnati, OH.
C. D. Biskner, C. A. Barton, and J. H. Millican.
Pulp and Paper, Vol. 52, No. 5, p 126-128, May, 1978. 2 fig, 5 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Filtration, *Suspended solids, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution sources, Pulp and paper industry, Sands, Coals, Water purification, Filters, Effluents, Coagulation, Cations, Polymers, Flow rates, Water pollution control, Dissolving pulp mills, Aluminum sulfate, *Water quality standards.

The performance of downflow and upflow dual-media filtration systems comprised of fine sand, coarse sand, anthracite coal, or combinations of these were compared in pilot plant studies conducted by Procter and Gamble Co. (Cincinnati, Ohio) and E. C. Jordan Co. (Portland, Maine) at the dissolving-pulp mill of Buckeye Cellulose Corp. near Perry, Florida. The type of filter media has little effect on the removal of total suspended solids (TSS) from the secondary (biological) treatment effluents. The addition of coagulant chemicals (viz., alum and a cationic polymer) raises the filter effluent TSS above the influent TSS level prior to coagulation. The best performance of granular media filtration that could be expected at a mill with secondary treatment effluent TSS ranging from 30 to 40 mg/liter would be 18 mg/liter (as compared to EPA's goal of 10 mg/liter) with an annual average of 20-25 mg/liter. The filters would have to be operated at a flow rate of 2 gal/min/sq ft to achieve these levels. (Swichtenberg-IPC)

ENERGY CONSUMPTION FOR ELECTRODIALYSIS OF SPENT SULFITE LIQUORS (ENERGOZATRATY NA ELEKTRODIALIZ OTRABOTANNOGO SHCHELOKA SUL'FITNO-TSELLYULOZNOGO PROIZVODSTVA),
V. A. Kirsanov, V. A. Smirnova, and L. A. Mazitov.
Sbornik Trudov, Tsentralnyi Nauchno-Issledovatel'skii Institut Bumagi, No. 10, p 216-220, 1975. 1 fig, 1 ref, 2 tab.

Descriptors: *Pulp wastes, *Sulfite liquors, *Waste water treatment, *Electrodialysis, *Energy, Wastes, Industrial wastes, Water pollution treatment, Electrical resistance, Water pollution control, Membrane processes, Dialysis, Separation techniques, Pulp and paper industry, Water pollution sources, Spent sulfite liquor.

In a study of the electrodialytic processing of magnesium-base spent sulfite pulping liquors of various concentrations, the effect of the electric resistance of the electrodialysis cell on the energy consumption was investigated, and calculations were made of the energy consumption during the consecutive stages of the process. The energy consumption was found to increase with increasing current density, but the use of low-density current is not justified in view of the relatively high amortization rate of the equipment. A compromise between the high energy consumption of high current density and the low efficiency of the equipment at low density involves a stepwise treatment of the spent liquor, i.e., diminishing the current density in consecutive stages of the process. In this case the overall energy consumption is within acceptable limits at sufficiently high efficiency of the process. (Stapinski-IPC)

CHARACTERIZATION OF SPENT BLEACHING LIQUORS. PART 1. ULTRAFILTRATION OF EFFLUENTS FROM CONVENTIONAL AND OXYGEN BLEACHING SEQUENCES,
Helsinki Univ. of Technology, Otaniemi (Finland). Lab. of Wood Chemistry.
K. Pfister, and E. Sjostrom.
Svensk Papperstidning, Vol. 81, No. 6, p 195-205, April 10, 1978. 9 fig, 37 ref, 6 tab.

Descriptors: *Bleaching wastes, *Pollutants, Chlorine, Hypochlorite, Chlorine dioxide, Oxygen, Alkaline extraction, Pulp wastes, Pulp and paper industry, Water pollution sources, Wastes, Industrial wastes, Organic matter, Carbon, Color, Biochemical oxygen demand, Toxicity, Pine trees, Effluents, Lime, Chemical precipitation, Waste water treatment, Waste treatment, Biological treatment, *Ultrafiltration, Oxygen bleaching, Bleaching agents, Molecular weight.

Spent liquors from laboratory bleaching of pine kraft pulp by the conventional CEH sequence were compared with effluents from oxygen (OCE and ODE) sequences. The dissolved material was fractionated by ultrafiltration (M below 1000, between 1000 and 10,000, and over 10,000) and analyzed for organic dry matter, organic carbon, permanganate-number, color, BOD, and toxicity. The main part (65-70% of the dissolved material) was found in effluents from the alkaline-extraction (E) stage of the CEH sequence and from the oxygen stage in the OCE and ODE sequences. Liquors from the C (chlorination), D (chlorine dioxide), and H (sodium hypochlorite) stages contained up to 60% low-molecular substances (M below 1000) and less than 10% high-molecular (M above 10,000) material. In contrast, 80-90% of the material which dissolved in E-stage liquors had molecular weights above 1000. Of the total color load (173 kg Pt/ton of pulp) in the CEH sequence 80% originated from alkaline extraction. Color loads from the OCE and ODE sequences were 34 and 8 kg Pt/ton, respectively, assuming 100% recovery of oxygen-stage liquors. Most of the color for all spent liquors derived from the M fraction above 1000. The 7-day BOD of the CEH effluent was about 12 kg oxygen/ton of pulp, to which the C-stage contributed 50%, the E-stage 40%, and the H-stage 10%. The 7-day BOD loads of the CE and DE stages following an oxygen stage were 5 and 3.5 kg oxygen/ton, respectively. Most of the BOD in the C, H, and O-stage liquors came from the low molecular (M below 1000) fractions, whereas high-molecular material contributed more than half of the BOD load in the E and D-stage effluents. The C-stage liquors contained by far the most toxic substances. Possible purification of spent bleach liquors by ultrafiltration, lime precipitation, and biological treatment are also discussed. A continuous clarifier is described for removing suspended solids from paperboard manufacturing effluents. The clarifier is composed of a metal-finished cone with a 5 m diameter, 7.8 m high cylinder reservoir which is divided into central distributing, suspended sediment, clean water, and settled sediment sections. Throughput of the clarifier is 90-110 cu m/hr. Operating temperature is 8-22C at atmospheric pressure. Effluent retention

time in the suspended sediment and clean water sections was 20-30 and 20 min, respectively. The suspended solids content in the effluent was reduced from 400 to 10-20 mg/liter. Fiber and kaolin removal was 96-98%; 5-day BOD was reduced 63%. With this system 6-70% purified water instead of fresh water can be used in board manufacture. (DuVall-IPC)

DEVELOPMENT OF AN EFFLUENT-FREE SULFITE PULP MILL (ENTWICKLUNG ZUR ABWASSERFREI ARBEITENDEN SULFIT-ZELLSTOFF-FABRIK),
R. Hornke.
Wochenblatt fuer Papierfabrikation, Vol 106, No 6, p 247-248, 250, March 31, 1978. 4 fig, 1 tab.

Descriptors: *Water pollution control, *Sulfite pulp mills, Pulp and paper industry, Water pollution sources, Waste treatment, Water pollution treatment, Wastes, Industrial wastes, Bleaching wastes, Pulp wastes, Evaporation, Burning, Condensates, Effluents, Sulfite liquors.

This proposal visualizes a system in which the effluents from the sulfite digestion of wood handled separately from those of the pulp bleach plant. The former which are rich in lignosulfonates are evaporated and burned, and the condensates reused. The latter which are rich in alkali and chlorine compounds will require different treatments, depending on the type of bleach. While the closure of the chemical pulping system has been successful in burning 99.8% of the total organic waste liquor content, the closing of a separate bleach-plant system will require further research and development work. Several compounds that have particular ion exchange or chelation properties have been adsorbed on granular graphite and coke. The resulting materials exhibit ion exchange and chelation properties similar to typical commercial exchange resins used for separations involving metal ions. However, the exchange capacities are lower (approximately 1000 times) than commercial materials. Particular attention has been devoted to the immobilization of several metals on Eriochrome Black-T modified graphite columns. Separation of Fe(3+) from multicomponent solutions of Fe(3+), Ni(2+), Co(2+), Mg(2+), and Ca(2+) possible by adjusting the pH of these solutions. Frontal analysis chromatography has been carried out utilizing EBT-graphite packing material for regular LC and HPLC techniques. Fe(3+) and Ni(2+) can be separated by HPLC using this modified graphite. Application of an electrical potential also is an effective method of removing metal ions from the modified graphite columns. The mechanisms of this removal is thought to be the electrochemical generation of H(+) ion. The removal of metal ions from aqueous solutions by formation of the metal hydroxides within granular electrode beds has been explored briefly. This is carried out by producing OH(-) ion electrochemically within the electrode bed, which results in metal hydroxide precipitation. (See also W79-00432)

An electrochemical synthesis has been studied and a continuous flow cell utilizing granular graphite or platinum dust for quantitative electrolysis has been developed. The synthesis reaction proceeds by way of electrochemical radical anion production followed by a homogeneous solution reaction. It is concluded that the electrochemical cell does function, but because of uncompensated resistances when used in aprotic organic solvents of low conductivity, product yields are very low for the p-iodonitrobenzene system. The anion radical produced for the reduction of p-iodonitrobenzene has been observed by ESR and compared to the radical produced in the presence of CN(-) ion. The electrochemical reaction has also been studied by cyclic voltammetry at room temperature and -45C. A reaction mechanism for the replacement of I(-) by CN(-) has been suggested and compared to that previously reported in the literature. A qualitative discussion of the resistances encountered in the granular beds is also presented. (See also W79-00431)

DISTRIBUTION OF HETEROTROPHIC AND NITRIFYING BACTERIA WITHIN THE AEROBIC-MEDIA TRICKLING FILTER,
West Virginia Univ., Morgantown.
G. W. Gillespie.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 175, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, 1977. 90 p, 6 fig, 32 tab, 27 append. OWRT A-036-WVA(1), 14-34-0001-7104.

Descriptors: *Aerobic treatment, *Nitrification, *Oxygenation, *Sewage treatment, *Trickling filters, *Waste water treatment, Aeration, Biological treatment, Equipment, Filters, Oxygen, Secondary treatment, Solids contact processes, Treatment, Wastes, Waste treatment, Water pollution treatment.

Distritbution and densities of the heterotrophic and nitrifying bacteria within the aerobic-media trickling filter (AMTF) were evaluated for response to changing detention times and nitrogen loadings. Comparison of the total mean densities obtained during each experiment indicated that nitrification within the AMTF reactor was dependent upon the activity of the nitrifying bacteria and not their densities. In general, increasing the detention time resulted in an increase of the nitrifying efficiency of the AMTF reactor. However, in some instances, increasing the detention time caused a reduction in the nitrification potential (nitrifying density) of the system. Comparison of the microbial densities of each site examined within the AMTF unit indicates that the heterotrophic and nitrifying bacteria are distributed throughout the entire depth of the reactor. No population profiles to reflect the changing water quality were observed.

This bench-scale study demonstrates the ability of the aerobic media trickling filter (AMTF) to successfully nitrify, when used as the second stage in a two stage carbon-nitrogen of aerobic slime attached to an inert media. The uniqueness of this system is the aeration provided by the media which permits the media to be submerted rather than requiring the void spaces to insure the availability of oxygen. There are 276 hollow teflon tubes which comprise the media. Each one has a 0.762 mm diameter and is bonded into a pressurized oxygen manifold at the top of the unit. These tubings hang the entire 196.0 cm of the vertical 39.0 mm diameter pipe which flows full of wastewater. Diffusion of oxygen through the 0.229 mm thick walls of the tubings provides the oxygen requirements for nitrification of the wastewater. The hydraulic loading was varied by adjusting the flow rate of the synthetic sewage feed. Substrate loading was altered by changing the concentration of the synthetic sewage. This AMTF system provides complete nitrification of secondary sewage. When compared to other trickling filters, plastic and rock, it surpasses them in efficiency. The AMTF also requires less volume for the same removal than the rotating biological contactor and is competitive with the packed bed reactor. The Hy Flo unit has a size advantage, but the AMTF does not require the recirculation.

nprovements in the original design and additional formation about the operational capabilities are emonstrated in this bench-scale study of the erobic-media trickling filter (AMTF), a new conept of biological wastewater treatment. The niqueness of this fixed growth system is that the ert media also provides aeration. The aerobic edia consists of 276 small teflon tubes bonded to a pressurized oxygen manifold at one end of e unit and hanging in loops down the length of a ertical pipe flowing full of wastewater. Diffusion f pressurized oxygen through the very thin walls f the tubes provides the oxygen requirements. ecirculation is used to vary the hydraulic loading n the unit. Organic loading is varied by changing ie concentration of the synthetic wastewater. his AMTF system accomplishes greater than 85 ercent remova of BOD and is not adversely afected by excessive accumulations of slime. Its erformance at high organic and hydraulic oadings indicates it would be amenable to secondary treatment of industrial and municipal wastevaters or would perform well in a roughing rocess. Preliminary information also indicates a rge unit-volume reduction in the AMTF comared to an oxygen-activated sludge unit or a lastic-media trickling filter.

CASE HISTORY: ASH DISPOSAL FROM AN OIL FRIED CENTRAL STATION,
Canal Electric Co., Sandwich, MA.
S. R. Hall, R. W. Jones, B. W. Lyons, and P. W. Pouliot.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9048-0178 ($0.75). In: Water--1977, AIChE Symposium Series, Vol 74, No 178, edited by G. F. Bennett, p 158-162, 1978, 7 fig.

Descriptors: *Waste treatment, *Power plants, *Dewatering, *Sludge, Industrial wastes, Filtration, Magnesium oxide, Vanadium, Sludge disposal, Sludge treatment, Vacuum filtration, Drying, Slurries, Sulfur compounds, Recycling.

The ash disposal system of an oil-fired power plant run by Canal Electric Co. (CEC) of Sandwich, Massachusetts, is described. Because oil used in this plant contains vanadium and sulfur compounds, magnesium oxide (MgO) is added before firing to produce a dry friable ash and protect against corrosion effect of vanadium oxide (V205). Based on experiences of neighboring plants, CEC decided on the following system for handling ash: (1) keep ash in hoppers dry and hot (300F); (2) let ash released in precipitator fall freely into sluicing water flowing in the bottom of the lines to a waste sump; (3) pump ash slurry to a convenient point for dewatering before disposal; (4) during boiler outages, remove the dry ash collected in furnace and ducts with manual labor or vacuum equipment and wash down remainder with resulting washwater going to waste sump. After an investigative period during which dewatering equipment was rented, CEC decided to install Eimco vacuum drum, belt type filter equipment. The water to the thickener contains 150 to 400 mg/l suspended solids and the sludge produced contains approximately 15% solids. This is reduced to a cake form of 35% solids and 65% moisture at the end of the filter belt. These cakes are transported to purchaser for recovery of vanadium . (See also W79-00342) (Majtenyi-IPA)

The use of sludge from a nylon polyester plant for land application was studied and found to be technically feasible and economically attractive. However, reliable operating conditions and favorable economics depend on site specific design. Thus, extensive soil tests must be done, fundamental soil treatment mechanisms must be considered, and waste constituents and land needs must be defined. In the study done on waste produced by the American Enco plant in Clemson, South Carolina, three parameters were characterized: waste constituent generation, waste assimilatory capability, and land limiting constituent. Soil studies revealed that general soil characteristic is Hiwassee, consisting of sandy clay loam and sandy loam with substantial amounts of micaceous, non-expanding clay minerals. Soils are not expected to swell and shrink significantly with wetting and drying. Nitrogen, phosphorus, and oxygen demands of vegetative matter were reviewed and considered in final system design, which was ultimately based on nitrogen land area requirements. The system chosen includes two parallel aerobic digesters of 40,000 gal capacity which require between 10 to 20 days to produce applicable waste. The total waste system cost $1.15 million with sludge application accounting for an estimated $95,000. This was considered more economical than other systems evaluated. EFFECT OF WHEY APPLICATION ON CHEMICAL PROPERTIES OF SOILS AND CROPS,
Kraft, Inc., Glenview, IL.
D. S. Watson, A. E. Peterson, and W. G. Walker.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9811-0178 ($0.95). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 176-186, 1978, 10 fig, 4 tab, 6 ref.

Descriptors: *Waste disposal, *Industrial wastes, *Whey, *Crop response, *Soil treatment, Soil water movement, Soil chemistry, Nutrients, Nitrogen, Phosphorus, Potassium, Soil properties, Irrigation, Experimental farms, Groundwater, Sinks, Dairy industry.

Land disposal of whey derived from Kraft, Inc. dairy processing plants was evaluated. Studies were carried out at experimental farms on the effects of spreading whey on soil or adding it in irrigation water. Results indicated that whey is beneficial to plants requiring large amounts of nitrogen. Tissue analysis was done to determine use of various elements found in the whey and indicated that calcium-phosphorus balance may be affected; but, even under maximum dosing conditions, no significant effect on the suitability of corn as animal feed was detected. Buildup of phosphorus and potassium in the soil were studied and these elements showed little tendancy for downward movement in the soil. Buildup is in direct proportion of the amount of applied in the whey. It is concluded that the soil acts as a vast sink for holding these nutrients until required for further crop production. Plant nutrients in whey sometimes move down into the soil beyond the principal root zone, occasionally to a depth of 9 feet in some areas. However, the likelihood of soil nutrients passing through the examined zones into groundwater does not appear significant and a brief examination of groundwater at one site confirmed this. SLUDGE TREATMENT BY SUPERSONIC JET-FLAME,
Tokyo Univ., Tokyo (Japan).
Z. Hokao.
Japan Pulp and Paper, Vol. 15, No. 3, p 43-48, October, 1977. 6 fig, 1 illus.

Descriptors: *Sludge treatment, *Pulp wastes, *Dewatering, *Heat treatment, Burning, Disposal, Incineration, Pulp and paper industry, Sludge, Water pollution sources, Water pollution control, Mathematical studies, Estimating equations, Equations, Cooling water, Temperature, Costs, Thermal insulation, Oil spills, Absorbents, Ultimate disposal.

The ignition of kerosene-fired jet burners used in the treatment of paper mill sludges (about 80% moisture content) is described. Mathematical equations are presented for calculating the nozzle-exit and throat temperatures, velocities, and specific weights; the throat pressure and cross-sectional area; the air flow rate; and the amount of cooling water required to protect the nozzles and combustion chamber. A flow sheet and cost data are given for a jet-flame plant treating paper mill sludge. Studies are reviewed in which the cotton-like product is used as an oil absorbent or heat insulator. Descriptors: *Sewage effluents, *Irrigation effects, *Oak trees, *Specific gravity, *Growth rate, Deciduous trees, Wastes, Waste disposal, Water pollution sources, Waste water disposal, Fertilization, Forest management, Irrigation, Trees.

Increment cores at breast height were removed from 41 white oak (Quercus alba and Q. Stellata) and 51 red oak (Q. coccinea and Q. velutina) trees growing on 2.5 acres in southern Missouri which was sprinkler-irrigated with treated sewage effluent. Growth rate increased significantly for white oaks but not for red oaks while specific gravity increased only for the red oak group. White oak trees of the larger diameter classes responded more favorably to treatment than trees in the smaller diameter classes. Red oak response appeared to be independent of diameter class for specific gravity data. The difference in age between the red and white oaks may have been an important factor in observed treatment effects. (Swichtenberg-IPC)
W79-00425

THE FEASIBILITY OF USING FOREST LANDS FOR RECYCLING SLUDGE NUTRIENTS IN NORTHERN NEW ENGLAND,
New Hampshire Univ., Durham.
M. Koterba.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 067, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, May 1977. 88 p, 22 fig, 6 tab, 120 ref. OWRT A-039-NH(3), 14-31-0001-4029.

Descriptors: *Sludge disposal, Forest soils, Natural resources, Vegetation, Liquid waste, rates of application, Methods of application, *Recycling, Waste disposal, *New England, Ionic concentrations, Chemistry of soil water, Streams, Lysimeters, *New Hampshire.

Dewatered and limed sludge was obtained from a primary treatment plant and spread at two rates, 25 and 125 wet t/ha, on sandy loam soils in a northern hardwood forest in N.H. Changes in soil water chemistry were assessed using water samples collected at 20 and 45 cm depths with suction lysimeters. The 125 t/ha rate caused an increase in the concentration of most ions in soil water during the first two years following application. At the 20 cm depth, just below the organic horizons, Cl reached a mean maximum of 27.5 mg/l after sludge application compared to control values of less than 0.3 mg/l. SO4 eventually increased 8-9 mg/l soon after application. Mean Ca values rose to over 13.5 mg/l compared to background concentrations of about 2 mg/l. Mg, Na, K, H, and NO3 ions showed maximum increases in concentration that averaged 2 to 3 fold greater than their control values of less than 0.5 mg/l. NH4 and total P were unaffected by the sludge application. At the 45 cm depth, just above a fragipan, the increases in ionic concentrations following the 125 t/ha application of sludge were less than one-half the increases that occurred at 20 cm depth. Within one year after the sludge was spread, the concentrations of most ions were smilar in the treated and control plots. Soil water chemistry at the 45 cm depth was similar to stream water chemistry in the study area. The changes that occurred in soil water chemistry at this depth after applying sludge at the heavy rate could reflect potential changes in stream water chemistry. The temporary enrichment of soil water nutrients after sludge application had minimal impact on the frequency and diversity of native herbs and shrubs and on basal area growth of trees.

WATER FILTERING AND DISPENSING APPARATUS,
E. N. Martin.
U.S. Patent No. 4,086,166, 9 p, 4 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 969, No. 4, p 1432-1433, April 25, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, *Water quality control, Filtration, Filters, Domestic water, Water conservation, Brines.

An improved water filtering, storing and dispensing apparatus is adapted to be connected with a pressurized municipal service water system to filter, purify, or upgrade the quality of the service system water, and store all of the filtered water produced for subsequent dispensing on demand. Waste water or brine which is the by-product of filtration is utilized as a motive fluid to act upon and effect pressure dispensing of stored filtered water. The apparatus operates to make and to store a limited predetermined volumetric supply of filtered water for dispensing and use, upon demand. It operates to consume service water and produce filtered water only when less than a full supply of filtered water is present and which shuts off automatically to stop all flow when a full supply of filtered water is present.
W79-00019

LOW MOLECULAR WEIGHT HYDROLYZED POLYACRYLAMIDE USED AS A SCALE INHIBITOR IN WATER SYSTEMS,
American Cyanamid Co., Stamford, CT. (Assignee).
D. S. Song, R. J. Duffy, C. R. Witschonke, A. M. Schiller, and M. A. Higgins.
U.S. Patent No 4,085,045, 3 p, 9 ref; Official Gazette of the United States Patent Office, Vol 969, No 3, p 1058, April 18, 1978.

Descriptors: *Patents, *Water treatment, *Water quality control, *Scaling, Chemical reactions, Hydrolysis, Corrosion control, Antiprecipitants.

A process for inhibiting scale formation uses a low molecular weight hydrolyzed polyacrylamide prepared by a process involving simultaneously and continuously charging separate streams of acrylamide monomer, ammonium persulfate (as catalyst) and mercaptoalkaonic acid (as chain transfer agent) to a reaction zone containing water under reflux. The rate of charging is such that the heat of polymerization is sufficient to maintain reflux in the reaction zone without exceeding the capacity of the condenser to remove the heat of reaction. Then the polymer product is reacted with sufficient aqueous caustic to hydrolyze from about 60 to 90% of the amide groups in the polymer product. (Sinha-OEIS)
W79-00027

TREATMENT OF WATER OR AQUEOUS SYSTEMS,
Ciba-Geigy Corp., Ardsley, NY. (Assignee).
A. Harris, J. Burrows, and T. I. Jones.
U.S. Patent No. 4,089,796, 5 p, 1 tab, 2 ref; Official Gazette of the United States Patent Office, Vol 970, No 3, p 1031, May 16, 1978.

Descriptors: *Patents, *Water treatment, *Demineralization, Scaling, Corrosion, Corrosion control, Additives, Zinc, Chemical reactions.

A process is provided for inhibiting the corrosion and scale forming tendencies of water or an aqueous system which comprises treating the water with from 0.1 to 500 ppm of an additive combination comprising from 2.5 to 80% by weight of zinc (calculated as Zn++) and from 97.5 to 20% by

eight of hydrolysed polymaleic anhydride, or of water soluble salt of such hydrolysed polymaleic nhydride. (Sinha-OEIS)
V79-00039

ATTERY OPERATED WATER PURIFICATION SYSTEM,
achs-Systemtechnik G.m.b.H., Schweinfurt West Germany).
V. Fischer, and B. Hengst.
J.S. Patent No. 4,089, 768, 9 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 970, No 3, p 1024, May 16, 1978.

Descriptors: *Patents, *Water treatment, *Water urification, Water quality control, *Electrolysis, Electric currents, Direct current, Equipment, Waste water treatment, Portable equipment, Batteries.

The proper operation of an electrolytic cell for water purification requires an adequate current to e passed between electrodes of the cell and an dequate dwell time of the water in the cell. The urrent flow through the cell depends on the conuctivity of the raw water which is not predicable nd not capable of being controlled. With water ow in mineral content, the conductivity may be uite low and is not affected by organic contamiants. A water purification system which is self-ontained and portable, sufficiently flexible to perate on a wide variety of water sources, and imple to operate, yet capable of reliably disinfectng water carrying pathogenic microorganisms hus should be capable of supplying a relatively igh voltage. The weight of a battery is directly roportional to the outpout voltage, yet a portable vater purification unit should be as light as possile. To achieve its objects the invention provides a vater purification system including an electrolytic ell in which the dwell time of the water in the cell s maintained by a pump which supplies raw water nd causes purified water to be discharged at a ixed rate. The unit may employ a battery of relaively low output voltage and correspondingly low veight because a D.C. power supply circuit receivng energy from the battery furnishes a D.C. outut voltage exceeding the battery voltage to the lectrolytic cell. (Sinha-OEIS)
W79-00043

WATER DISTILLER WITH CONE SHAPED CONDENSER,
F. C. Kirschman, and W. B. Bolte.
U.S. Patent No. 4,089,750, 6 p, 2 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 970, No 3, p 1019, May 16, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, Water quality control, *Distillation, Condensation, Equipment.

A water distiller arrangement provides for an efficient distillation process where the inlet water supply is controlled as a function of the temperature of the output of the distiller, and inlet water is preheated in an interior chamber surrounded by a passageway through which the water vapor passes after leaving the boiling chamber and while it condenses. The unit is quite compact because of the inclusion of the preheat chamber and condensing chamber in spaces that normally would be unoccupied in distillers where the chambers are stacked one on top of the other, and at the same time the construction is simplified and assembly time and costs reduced. (Sinha-OEIS)
W79-00045

APPARATUS FOR PRODUCING HIGH-PURITY WATER,
Department of Health, Education and Welfare, Washington, DC. (Assignee).
N. A. Karamian.
U.S. Patent No. 4,089,749, 9 p, 4 fig, 2 tab, 11 ref; Official Gazette of the United States Patent Office, Vol 970, No 3, p1019, May 16, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, Water quality control, Distillation, Condensation, Equipment, Toxins, Endotoxins.

In pharmaceutical work it is important that the water used for the preparation of parenteral solutions be free from endotoxins. The water used for this purpose is normally made by distillation. During distillation, the endotoxins in the feed water carry over by entrainment and contaminate the distillate. In order to prevent endotoxins and other impurities from entering the distilled water, the still must be designed to prevent creepage and entrainment. The water in a storage vessel must also be kept sterile and protected from chemical contamination. The apparatus of this invention includes a distillation flask, a carboy and a condenser unit, all of borosilicate glass. A respective filter is provided between the ambient atmosphere and the interiors of the flask, the carboy and the condenser unit to remove airborne bacteria and dust particles. In inlet valve is provided for feeding water into the flask, all water-contacting parts of this valve being of polytetrafluoroethylene. The open parts are interconnected with flexible, polytetrafluoroethylene tubing. A two-way, stopcock allows high-purity water to be removed from the carboy. (Sinha-OEIS)

W79-00051

EMPLOYING METHYLENE PHOSPHONATES OF OXYALKYLATED POLYALKYLENE POLYAMINES IN CHELATION AND/OR SCALE INHIBITION,
Petrolite Corp., St. Louis, MO. (Assignee).
P. M. Quinlan.
U.S. Patent No. 4,088,574, 8 p, 4 tab, 8 ref; Official Gazette of the United States Patent Office, Vol 970, No 2, p 635, May 9, 1978.

Descriptors: *Patents, *Water treatment, *Scaling, Chemical reactions, *Chelation, Corrosion control.

Compounds used as scale inhibitors, chelating agents etc. consist of methylene phosphonates of oxyalkylated polyaklylene polyamines having at least three nitrogen atoms wherein there are nitrogen-bonded methylene phosphonate units of the formula -- CH2PO(OM)2. (Sinha-OEIS)
W79-00052

PROCESS FOR THE TREATMENT OF WATER SOLUTION BY ION EXCHANGE,
Hager and Elsaesser, Stuttgart-Vaihingen (West Germany). (Assignee).
K. Marquardt.
U.S. Patent No. 4,088,563, 21 p, 12 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 970, No 2, p 632, May 9, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, *Desalination, *Water softening, Ion exchange, Resins, Equipment, Regeneration, Backwashing.

The treatment of water such as preparation, softening and/or desalinating is accomplished by ion exchange processes. In the quasi-continuous treatment, the ion exchange resins are conducted through a treatment container and a regenerating-and-washing-column. The ion-exchange resins leave the liquid treatment container through a bottom funnel, and before entering the regenerating-and-washing-column flow into a rinsing tank in which they are thoroughly re-rinsed at lease once during each entire cycle. The removal of the ion-exchange resins from the rinsing tank and from the regenerating-and-washing-column is by means of an immersion tube at the top of the regenerating-and-washing-column, the depth of immersion of the immersion tube being adjustable according to the volume in the bottom funnel of the treatment container. (Sinha-OEIS)

WATER TREATMENT: IRON, BOILER WATER AND WATER ANALYSIS.
Ground Water Age, Vol. 13, No. 1, p 19-23, September, 1978. 2 fig.

Descriptors: *Water treatment, *Iron, *Manganese, *Chemical feed pumps, *Boilers, Water analysis, Water sampling, Corrosion, Scaing, Oxidation, Filtration, Bioassay.

Iron and manganese impart a metallic taste to water, cause stains on tableware, plumbing fixtures and laundry, and form sludge deposits in piping, pressure tanks, water heaters, etc. In small concentrations they can be removed with an ordinary softener. For medium concentrations an oxidizing filter is used which requires periodic regeneration with potassium permanganate. For high concentrations, chlorination with a chemical feed pump and filtering is required. Low-pressure boiler water treatment is especially important since scale or sludge reduce boiler efficiency and water flow and corrosion damages the heating system. Contaminants in boiler water come from three sources: (1) incoming feed water; (2) installation by-products; and (3) products of corrosion. The proper start-up procedure for boilers is outlined. This is the most important means of preventing trouble in boiler water. After start-up, boilers should undergo periodic oil emulsification, rust prevention, scale elimination and foaming control to maintain the water in proper condition. Small leaks can be plugged with 'stop leaks.' For drinking water, periodic bio-analyses are strongly recommended. The proper procedure for water sampling is outlined and several sample analyses, indicating different water problems and treatment solutions, are discussed. (Purdin-NWWA)
W79-00176

WHAT'S IN THE WATER, A LOOK AT THE PROPOSED EPA REGULATIONS FOR ORGANIC CHEMICALS IN PUBLIC WATER SUPPLIES,
M. R. Richard.
Water Well Journal, Vol. 32, No. 10, p 68-71, October, 1978.

Descriptors: *Water treatment, *Activated carbon, *Organic wastes, *Water pollution control, Municipal water, Regulation, Carcinogens

The U. S. Environmental Protection Agency, after finding organic chemicals in the drinking water supplies of many cities, has proposed regulations for the removal of organics by treatment with granular activated Carlon (GAC). Recent studies suggest that organics cause cancer at high dosage levels, but whether they are carcinogenic in trace quantities is questionable. Techniques to identify organics vary widely and lack precision. Thus, it is difficult to tell whether GAC can remove a substantial percentage of organics. GAC itself may contain carcinogenic substances or become a medium for bacteria, molds and algae, all of which could add toxic substances to the water. Since GAC has never been used in the U. S. for organics, the EPA and water systems managers disagree concerning the regeneration frequency and cost of carbon beds. More research is needed to test GAC and other techniques for organics control, such as adsorption, disinfection, resin beds and aeration.

It is hoped that effective, practical alternatives to the proposed regulations can be developed.

ON THE VERTICAL DISTRIBUTION AND SEASONAL DEVELOPMENT OF THE DENSITY OF DREISSENA POLYMORPHA LARVAE IN THE PELAGIC ZONE OF THE LAKE OF ZURICH (IN GERMAN),
Gesundheitsinspektorat Stadt Zurich, (Switzerland).
P. Suter-Weider, and U. Zimmermann.
Schweiz Z Hydrol 38(2), p 159-170, 1976.

Descriptors: Lakes, *Lake of Zurich, *Mussels, Larvae, Water pollution control, Water treatment.

The freshwater mussel D. polymorpha Pallas was sighted for the 1st time in Lake Zurich about 1969. This indicated a problem for the treatment of the lake water. By means of a pump and vertical net hauls more information was added to that existing on Lake Zurich. Additional dates about temperature, depth of Secchi disk visibility and beam transmittance were collected. The larvae of D. polymorpha appeared at the beginning of June. Following the mean temperature of the epilimmion the number of individuals/m2 reached a maximum of 210,000. The greatest concentration of larvae measured in 1974 was 54,375/m3 at a depth of 4 m. The last appearance of D. polymorpha was observed at the end of Oct.--Copyright 1978, Biological Abstracts, Inc.

ON-SITE GENERATION OF HYPOCHLORITE SOLUTIONS BY ELECTROLYSIS OF SEAWATER,
Diamond Shamrock Corp., Painesville, OH.
J. E. Bennett.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9617-0178 ($0.95). In: Water--1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 265-269, 1978, 4 fig, 13 ref.

Descriptors: *Sea water, *Electrolysis, *Chlorides, Hypochlorite, *Disinfectant, Waste water treatment, Chlorine, Hydrogen, Anodes, Electrochemistry, Electrodes, Salinity, Municipal wastes, Industrial wastes.

Electrolysis of sea water was evaluated as a method of on-site generation of hypochlorite and found to be a feasible alternative to using chlorine or purchased hypochlorite as a disinfectant. Laboratory testing was followed by studies using large, production-size cells capable of producing 1200 lb of available chlorine a day using four 300-lb cells in hydraulic series. These cells were built of polyvinyl chloride to protect against the corrosive action of hypochlorite, and acrylic covers were used for better visibility. Chlorine is generated at the anode according to the reaction, 2Cl(-) = Cl2 = 2e(-). Chlorine immediately undergoes hydrolysis to hypochlorite, Cl2 = H2O = HClO + Cl(-) + H(+). Of course, other competing reactions do take place but their effects can be minimized by proper cell design, choice of electrode materials, and choice of operating parameters. Sea water containing 50% to 100% average salinity can be electrolyzed to produce hypochlorite solutions of 1 - 4 g/l available chlorine. AC power consumption ranges from 1.5 to 2.9 kwh per pound of chlorine depending on temperature and salinity of the sea water. The process also produces 5.8 cu ft of hydrogen per pound of available chlorine according to the equations: HClO = ClO(-) + H(+) and 2H(+) + 2e(-) = H2. Hydrogen must be disengaged from the hypochlorite stream before use, to prevent explosion hazards. It can be burned for fuel or vented to the atmosphere. (See also W79-00342) (Majtenyi-IPA)

RURAL WATER SUPPLIES FROM LATERITE RUNOFF,
Nigeria Univ., Nsukka. Dept. of Civil Engineering.
N. Egbuniwe.
Water Resources Bulletin, Vol. 14, No. 2, April 1978, p 466-469. 1 fig, 3 tab, 4 ref.

Descriptors: *Water supply, *Runoff, *Laterites, *Nigeria, Rural areas, Sedimentation, Dry season, Floccualtion, Wood ash, Clear water, Turbudity, Coliform count, Plate count, *Water treatment, Water quality.

Villagers living around Nsukka in Eastern Nigeria derive their water supplied during the dry season by subjecting the runoff from laterite soils to five months' sedimentation. This study found that by flocculating the runoff with wood ash at a dose of 5 g/l, clear water--with turbidity of less than 5 JTU, Fe of less than 1 mg/l, Coliform count zero MPN, and Plate count of less than 5 colonies--was achieved after three days sedimentation. 5G. Water Quality Control

ECOLOGICAL SYSTEM AND METHOD,
R. E. Burton.
U.S. Patent No. 4,086,161, 10 p, 6 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 969, No. 4, p 1430-1431, April 25, 1978.

Descriptors: *Patents, *Water quality control, Eutrophication, Ecology, Bodies of water, Biological communities, Aquatic algae, Balance of Nature, Bark.

An ecological system and method for counteracting the effects of excessive nutrient deposition (eutrophication) in bodies of water such as marshlands, inland ponds and lakes makes use of clusters of substantially individualized bark fibers positioned in upper, relatively oxygen-rich zones of such bodies of water. The bark clusters function to attract and hold excessive nutrient deposition in the form of colloidal wastes (e.g., colloidal solids of various types, single cell bacteria, etc.) and aquatic algae produced, while at the same time providing a safe habitat for algae predators and feeders in the form of minute animal organisms (e.g., crustacea, rotifers, snails, zooplankton, etc). The isolation and dispersion of the bark fiber clusters on the surface of the threatened bodies of water serves to prevent a disruptive imbalance between the algae and algal feeders by providing increased areas for life and surface breeding of various types of algae predators to thereby maintain essential trophic balance. (Sinha-OEIS)
W79-00021

SKIMMING APPARATUS,
N. J. R. Hartwick, and D. C. C. Lathe.
U.S. Patent No 4,085,049, 9 p, 7 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 969, No 3, p 1059, April 18, 1978.

Descriptors: *Patents, *Water pollution treatment, *Water pollution control, Oil pollution, Skimming, Water quality control, Equipment.

A device for removing oil and like products from the surface of water comprises at least a pair of spaced float members with an interconnecting shaft and a elongated, open sided reservoir having a weir edge. The cylinder reservoir is mounted on the shaft for free rotation. The central longitudinal axis of the reservoir is offset to the rear with respect to the axis of the shaft so that flotation of the reservoir lowers the front weir edge to allow fluid to enter the reservoir over the weir. Removal of skimmed fluid from the reservoir controls the depth of skim. (Sinha-OEIS)

SOLID-FLUID CONTACTING PROCESS,
Ashi Kasei Kogyo Kabushiki Kaisha, Osaka (Japan). (Assignee).
T. Misumi, T. Miyaji, and M. Kasai.
U.S. Patent No 4,085,042, 6 p, 2 fig, 3 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 969, No 3, p 1057, April 18, 1978.

Descriptors: *Patents, *Water treatment, *Water quality control, Adsorption, Resins, *Solids contact process, Ion exchange, Countercurrent flow, Regeneration.

A fixed-bed solid-fluid contacting process is provided comprising passing a fluid to be treated through a treatment zone packed with solid particles in one direction, regenerating the solid particles on depletion in activity by passing a fluid for activation in a direction opposite to the flowing direction of the fluid to be treated, washing the solid particles of contamination by extracting a portion of the solid particles simultaneously with the passing of the fluid to be treated through an outlet arranged in a position opposite to the flowing direction of the fluid to be treated to transport into a washing zone which is furnished separately from the treatment zone and recycling the washed solid particles into the treatment zone. The process is improved in the time cycle of treatment which is shortened and the pressure loss which is decreased. The process is also free from disturbance of bed and excellent in treatment efficiency. Typical example of application is ion exchange reaction. (Sinha-OEIS)
W79-00029

METHOD AND COMPOSITION FOR PREVENTING WATER CONTAMINATED WITH INDUSTRIAL WASTE SEEPING THROUGH SOIL CONTAINING SAID WATER,
American Colloid Co., Skokie, IL. (Assignee).
A. G. Clem.
U.S. Patent No. 4,084,382, 4 p, 5 ref; Official Gazette of the United States Patent Office, Vol. 969, No. 3, p 836, April 18, 1978.

Descriptors: *Patents, *Soil sealants, *Seepage, *Industrial wastes, Waste water disposal, Bentonite, Expansive soils, Containment.

A method is disclosed for containing water having a high concentration of water-soluble industrial waste which, when in contact with bentonite, disintegrates the bentonite thereby allowing seepage of water through the soil. A soil sealant composi-

ion consisting essentially of bentonite, a water-soluble dispersing agent, and a water-soluble polymer is mixed with the soil. The water-soluble polymer is selected from the group consisting of polyacrlylic acid, water-soluble salts of polyacrylic acid, hydrolyzed polyacrylonitrile, polyvinyl acetate, polyvinyl alcohol, copolymers of the foregoing, and a copolymer of acrylic acid and maleic anhydride. The amount of water-soluble polymer is from 0.1 to 3.0% by weight, and the amount of water-soluble dispersent is from 0.1 to 3.0% by weight. The weight ratio of water-soluble dispersant to water-soluble polymer is from 6.1 - 36%. The soil sealant composition when mixed with soil forms a water-containing enclosure. (Sinha-OEIS)
W79-00034

OIL FENCE,
A.B. Sjuntorp (Sweden). (Assignee).
R. G. Hallhagen.
U.S. Patent No. 4,084,380, 6 p, 6 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 969, No 3, p 835, April 18, 1978.

Descriptors: *Patents, *Oil pollution, *Water pollution treatment, *Water quality control, Barriers, Floating, Oil fences, Containment.

An oil fence is especially adapted for defining of impurities on a water surface and is made of a web of cloth shaped material exhibiting alternating connected portions and multiple layer portions made in such a manner that pockets and/or channels are formed to receive float bodies for the support of the oil fence in water, and sinking weights in order to give the oil fence the intended upright position in the water. The cloth shaped web is comprised of an impregnated and/or coated textile material which is woven. The single layer portions are shaped from the interwoven weft of the converging layers of the adjacent multiple layer portions, thereby obtaining an extremely strong connection. (Sinha-OEIS)
W79-00036

BELT TYPE OIL REMOVAL UNIT,
Tenco Hydro/Aerosciences, Inc., Countryside, IL. (Assignee).
G. A. Ettelt, and A. L. Cohen.
U.S. Patent No. 4,089,784, 4 p, 3 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 970, No. 3, p 1028, May 16, 1978.

Descriptors: *Patents, *Oil pollution, *Water pollution treatment, *Water pollution control, Skimming, Equipment, Separation techniques, Rotary drums, Endless belts.

A system is provided for removing accumulated oil from a basin. An endless belt for carrying oil is partially submerged in the basin and is driven and supported by a rotary drum. The rotary drum has an irregular surface for frictional cooperation with the belt and a spring-biased roller urges the belt against the irregular surface. The oil scraping means comprises an oil wiper on the downstream side of the drum and the system further includes means for wiping the underside of the drum surface.

APPARATUS FOR DEPLOYING AND TAKING UP AN OIL FENCE,
Mitsubishi Electric Mfg. Co. Ltd., Amagasaki (Japan).
T. Kinase, I. Yano, K. Okubo, H. Kitakoga, and H. Tayama.
U.S. Patent No. 4,089,178, 10 p, 19 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 970, No 3, p 833, May 16, 1978.

Descriptors: *Patents, *Oil spills, *Water pollution control, Water quality control, Barriers, Equipment, Floating, Oil fences, Containment, Deployment.

An apparatus for deploying and taking up an oil fence for housing and spreading it in a simple manner with a high efficiency comprises, in combination, a floating framework having side walls defining a substantially enclosed receiving space in which an oil fence is to be stored with its width vertical. One side of the framework is partly cut away to provide an opening into the receiving space. A guide comprised of rollers is placed at the opening with the axes of the rollers vertical to that the width of the oil fence is always vertical. (Sinha-OEIS)
W79-00048

PROCESS AND APPARATUS FOR SEPARATING OIL FROM WATER CONTAMINATED WITH OIL,
Fujisash Industries, Ltd., Kawasaki (Japan). (Assignee).
T. Yoshioka, and S. Iwanami.
U.S. Patent No. 4,088,578, 12 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 970, No 2, p 637, May 9, 1978.

Descriptors: *Patents, *Water pollution treatment, Water quality control, *Oil pollution, Separation techniquesm Specific gravity, Equipment, Bilge water.

Water contaminated with oil, such as bilge water, is pumped into a closed vessel. Separation of the oil and water is accomplished due to the floating of oil on the water because of their different specific gravities. The separated oil is sucked through a conduit to discharge the separated oil and reduce the pressure of the liquid phases. The purified water is discharged through a conduit provided with a non-return valve. The purified water is forced to flow through the conduit by the pressure of a stream of bilge water which flows into the container. (Sinha-OEIS)

METHOD FOR DEPOLLUTING FRESH AND SEA WATER FROM PETROLEUM PRODUCTS,
Snam Progetti S.p.A., Milan (Italy).
W. Marconi, R. Olivieri, L. Degen, and A. Robertiello.
U.S. Patent No. 4,087,356, 6 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 970, No 1, p 237, May 2, 1978.

Descriptors: *Patents, *Water pollution control, Water quality control, *Oil pollution, Biodegradation, *Microbial degradation, Nitrogen compounds, Microorganisms, Dispersion, Freeze-dried hydrocarbon-oxidizing microorganisms.

Microorganism cultures used for oxidizing the hydrocarbons are integrated by lipophilic and floating compounds which contain slow-release nitrogen in a form which can be assimilated by such microorganisms. Ureidic derivatives of higher aldehydes are the preferred compounds. Inert supports can be used, if necessary, and still better results are achieved when using also nonionic dispersants and freeze-dried hydrocarbon-oxidizing microorganisms. The substances can be stored for indefinitely long times, do not belong to the category of toxic products, can easily be shipped to the place of their use, and can easily be spread over the polluted surfaces. The used nutrients accelerate a natural biological degradation process of the pollutants without disturbing the ecological equilibrium. On completion of the use no more residues are left and, in the case of porous bodies, the residues are nothing but minerals which already exist in the natural environment. (Sinha-OEIS)

ADAPTATIONS AND RESISTANCE TO ANOXIA IN CLOEON DIPTERUM (EPHEMEROPTERA) AND NEMOURA CINEREA (PLECOPTERA),
Uppsala Univ. (Sweden). Inst. of Zoophysiology.
B. Nagell, and T. Fagerstrom.
Oikos, Vol. 30, p 95-99, 1978. 7 fig, 1 tab, 10 ref.

Descriptors: *Mayflies, *Stoneflies, *Oxygen requirements, *Water temperature, Insects, Insect behavior, Adaptation, Habitats, Mortality, Larval growth stage, Ponds, Seasonal, *Acclimation.

The survival of larvae of Cleon dipterum and Nemoura cinerea was studied after exposure to anoxia for 40 h at temperatures between 0C and 11.5C. If the larvae were acclimated to 2C for 6 wk C. dipterum survived temperatures close to 0C better than N. cinerea. If they were acclimated to 10C, most C. dipterum died at all experimental temperatures. N. cinerea died to 60% at 5C; at higher or lower temperatures the mortality increased. A 6-d stay in 2C of C. dipterum previously acclimated to 10C was not long enough to induce resistance to anoxia. When exposed to anoxia N. cinerea became unconscious within 10 min. whereas larvae of C. dipterum did so first within 60 min. It is concluded that a long term acclimaton to low temperatures induces in C. dipterum but not in N. cinerea a high degree of resistance to anoxia at temperatures close to 0C. This resistance is of great importance for C. dipterum since in cold temperated regions this species usually overwinters in anoxia conditions. The different rate at which the species lose consciousness in in anoxia may be important for their survival in natural habitats. (EIS-Deal)

ENVIRONMENTAL MANAGEMENT STRATEGY FOR THE GREAT LAKES SYSTEM.
International Reference Group on Great Lakes Pollution from Land Use Activities.
July, 1978. 134 p, 15 fig, 24 tab, 95 ref, 4 append.

Descriptors: *Great Lakes, *Environmental control, *Water quality, *Land drainage, *Sediment, *Water pollution sources, Pollution, Phosphorus, Mercury, Bacteria, Erosion, Lead, Pesticides, Polychlorinated biphenyls, Eutrophication, Lake Erie, Lake Huron, Lake Ontario, Lake Michigan, Lake Superior, Tributaries, Organic compounds, Microorganisms, Trace elements, Nitrogen, Chlorides, Asbestos, Viruses, Land use, Watersheds(Basins), International commissions.

Results are presented of a study of pollution of the boundary waters of the Great Lakes system by land drainage (including ground and surface runoff and sediment) from agriculture, forestry, urban and industrial land development, recreational and parkland development, utility and transportation systems, and natural sources. Land drainage is the source of pollutants such as phosphorus, bacteria, polychlorinated biphenyls, pesticides, industrial organic chemicals, mercury, and lead. Each pollutant is discussed in terms of background, sources, concentrations, and control recommendations. Factors involved in production of pollutants, such as land characteristics, land use intensity, materials usage, and meteorology of the region are described. Management strategy for the Great Lakes ecosystem is outlined and recommendations are made which stress site-specific approaches to reduce loadings of pollutants. The study resulted in new knowledge of the relationships between nonpoint source pollution and land use activities in the many watersheds draining to the Great Lakes, the impact of these land use activities upon quality of the receiving waters, the pollutants transported by tributaries, and the impact of the pollutants on the lakes themselves.

Statistics on pollutant concentrations in specific areas, land use activities, and estimates of total pollutant concentrations in sediments, are provided. (Majtenyi-IPA)

INFLUENCE OF STRIP MINES ON REGIONAL GROUND-WATER FLOW,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
J. L. Wilson, and D. A. Hamilton.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY9, Proceedings Paper 13988, p 1213-1223, September 1978. 7 fig, 12 ref, 2 append.

Descriptors: *Strip mines, *Base flow, *Groundwater, *Great Plains, *Model studies, Aquifers, Water sources, Water resources, Coal mines, Dewatering, Excavation, Analytical techniques, Finite element analysis, Mathematical models, Numerical analysis, Flow, Groundwater movement, Phreatic lines, Water table.

The effect of an operational strip mine on regional groundwater flow was investigated using a finite element model of the steady flow system. Mine location, mine size, water table configuration, and subsurface layering of aquifer units were examined. The results demonstrated that: (1) The impact of a mine can extend far beyond its radius of influence at the water table; (2) mines placed near regional discharge areas have a more significant effect on the regional system; (3) natural water-table variation due to topography masks the effects of some mines; and (4) buried aquifers beneath the mine excavation limit the amount of flow field distortion caused by the mine. SEA-WATER NEUTRALIZATION OF EFFLUENTS FROM THE INDUSTRIAL PROCESSING OF PHOSPHORITE. A CASE STUDY IN THE PRACTICAL USE OF BASIC KNOWLEDGE IN ANALYTICAL AND MARINE CHEMISTRY,
Chalmers Univ. of Technology, Gotborg (Sweden); and Goteborg Univ. (Sweden). Institutionen for Analytisk Kemi.
D. Dyrssen, and B. Elgquist.
Analytica Chimica Acta, Vol. 100, p 23-29, 1978. 3 fig, 3 tab, 17 ref.

Descriptors: *Fluorides, *Silicon, *Chemical wastes, *Neutralization, *Waste dilution, Sea water, Computer programs, Analhytical techniques, Graphical analysis, Volumetric analysis, Chemical reactions, Chemical properties, Solubility, Phosphorus compounds, Waste water treatment, Byproducts, Industrial wastes.

The HALTAFALL computer program identified the reactions occuring during the neutralization and dilution with sea water of silicon tetrafluoride (SiF4) and hexafluorosilicic acid (H2SiF6); these compounds are byproducts of superphosphate, phosphoric acid, and phosphate production. Previously derived equilibium constants for the complexation of magnesium and calcium with fluoride, acidity constants for carbonate ions in sea water, and disproportionation equilibria for soluble silicon species were selected for the HALTAFALL calculation. The program was applied to a case in which 270 kg/hr of fluoride as SiF4 were removed with 240 cu m/hr of sea water in a scrubber; 140 kg/hr of F as fluorosilicic acid were added to the effluent and diluted with sea water. Measurements on the sea water included: salinity (18.82 ppt), total alkalinity (0.00195 moles), total calcium (0.0060 moles), total magnesium (0.029 moles) and total fluoride (0.00004 moles). The effluent contained 0.0592 moles of fluoride in the form of SiF4, and 0.0307 moles as H2SiF6. Calculated pH curves indicated that neutralization was achieved at a dilution of 1:40-50; the concentrations of silicon complexes decreased rapidly as dilution approached the equivalence value. If the solubility product of calcium and fluoride was greater than the ionic strength of the brackish water, precipitation occurred unless the solution was rapidly diluted from 1:25 to 1:200. Predictions by the HALTAFALL program were verified by titration experiments with sea water and the industrial waste stream. (Lisk-FIRL)

OIL/WATER SEPARATION TECHNOLOGY: THE OPTIONS AVAILABLE - PART 2,
American Cyanamid Co., Stamford, CT.
R. B. Tabakin, R. Trattner, and P. N. Cheremisinoff.
Water and Sewage Works, Vol. 125, No. 8, p 72-75, August, 1978. 3 fig, 31 ref.

Descriptors: Oily water, *Emulsions, *Oil wastes, *Separation techniques, *Flotation, Centrifugation, Acidity, Coagulation, Salts, Coalescence, Drops(Fluids), Filters, Activated sludge, Trickling filters, Fibrous beds, Carbon filters, Membrane processes, Reverse osmosis, Dispersion, Waste water treatment, Industrial wastes.

Processes and equipment are evaluated for the separation of oil and water from oil refinery effluents. Air flotation can reduce the effluent oil content to 1-20 ppm. In general, air is dissolved in the effluent at 2-3 atm; the pressure is released; and bubbles are formed. Variations of this process include: full-flow operation, in which the entire influent flow is air saturated; split-flow operation, where part of the flow is pressurized and aerated and the rest is diverted directly to the flotation chamber; and recycle operation, in which influent is mixed with re-pressurized, dissolved air-bearing clarified effluent. Centrifugal separators, removing oil in a small column at the vortex, have been found more efficient in separating water-in-oil emulsions, oil-wet solids, and dispersed oil. Of the chemical, physical, and electrical emulsion breaking techniques, chemical treatment is most common. Methods of chemical separation include acidification, coagulation, salting out, and demulgation with organic demulsifiers; jar testing of demulsifiers is recommended to determine optimum conditions. Coalescence, utilizing fibrous filter media such as nylon, propylene, or fiberglass wrapped around a rigid spool, operates on the principle of gravity settling of large droplets formed from smaller droplets. Biological treatment by trickling filters or activated sludge is only effective for low oil concentrations. Large capital investiments have been associated with carbon adsorption and membrane filtration techniques. (Lisk-FIRL)

NO WATER-SOURCE DAMAGE FOUND IN OIL STATES.
The Oil and Gas Journal, Vol. 76, No. 35, p 52, August 28, 1978.

Descriptors: *Oil pollution, *Water pollution control, *Saline water intrusion, Aquifers, Interstate commissions, Chlorides, Correlation analysis, Well regulations.

The Interstate Oil Compact Commission (IOCC) sponsored a study of ground-water contamination by oil and gas operations in five big producing states: Texas, New Mexico, Oklahoma, Louisiana, and Arkansas. The study utilized over 450 monitoring points in major aquifers overlying oil and gas producing reservoirs and covered a 15 year record of well water tests. In four of the states, chloride concentration in the water was monitored and was not found to increase. In Texas, four approaches were made involving the statistical relationship between chloride concentration in ground water and oil production; chloride variation in public water supplies near oil and gas fields, salinity contours for different time periods, and a review of related literature and research. The study concluded that no significant relationship exists between chloride increases in groundwater and oil and gas production, and that regional changes in groundwater quality are associated with natural causes. DATA BASE SYSTEM FOR STATE WATER QUALITY MANAGEMENT INFORMATION SYSTEM.
Pennsylvania Dept. of Environmental Resources, Harrisburg. Bureau of Water Quality Management.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 180, Price codes: A03 in paper copy, A01 in microfiche. Report No EPA-600/5-78-007, May 1978. 27 p, 2 fig, 4 ref, 4 append. S-801000.

Descriptors: *Water quality, *Water quality control, *Water resources, *Information retrieval, Data collections, *Pennsylvania, Water resources research, Data processing, Information exchange, Water resources development, Interstate, Groundwater, Surface water, Administration, Water pollution control.

To provide systems which would enhance the speed and precision of decision making in the field of water quality management, the State of Pennsylvania initiated a program of information handling known as WAMIS, or State Water Quality Management Information System. The objectives of the first grant period, beginning January 1, 1969, were to enhance and demonstrate this system which could be made available for use by Federal, other State, and inter-State water pollution control agencies, and to provide a base for a Water Quality Management Data Systems techniques training program for Federal, State, and inter-State water quality management personnel. Part of the proposed system was implemented using standard keypunch card data entry for processing on a UNIVAC (RCA) SPECTRA 70/45 and provided predetermined periodic reporting capability. This portion of the system was reported in EPA publication 600/5-74-022 entitled, 'Demonstration of a State Water Quality Management Information System.' Since then, systems concepts, systems design techniques, software and telecommunications capability have experienced marked changes which are reported. Some of the areas of water quality management covered by the WAMIS system are: facility inspections; progress in terms of enforcement, construction, and water quality upgrading; permit processing; identification of problem areas and priorities; determination of specific treatment, research, and budgetary needs; treatment plant operations; treatment plant operator certification; word processing; ground- and surface water quality; and planning. REMOTE MONITORING OF COAL STRIP MINE REHABILITATION,
National Aeronautics and Space Administration, Slidell, LA. Earth Resources Lab.
J. E. Anderson, and C. E. Tanner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 647, Price codes: A04 in paper copy, A01 in microfiche. Report No EPA-600/7-78-149, July 1978. 58 p, 17 fig, 11 tab, 18 ref, 3 append. 68-03-2636.

Descriptors: *Remote sensing, *Aerial photography, *Surveying instruments, *Mapping, *Land reclamation, *Strip mines, *Inter-agency cooperation, Coal mines, Vegetative cover, Water resources, Landsat, Multispectral scanner, Data processing, Data storage and retrieval, Land reclamation, Revegetation.

A cooperative project is being carried out by the Environmental Protection Agency (EPA) and the National Aeronautics and Space Administration (NASA) to share both hardware and software technology for processing remotely sensed digital data obtained from aircraft or satellites. The project is divided into three phases, the first of which is reported here. During this phase the state-of-the-art technology for processing aircraft-acquired multispectral scanner (MSS) data was transferred to the Environmental Monitoring and Support Laboratory in Las Vegas, NV. (EMSL-LV). Also, Landsat and aircraft multispectral scanner data and photographic data over coal strip mines in the Western United States were analyzed using basic pattern recognition techniques refined and/or developed at the NASA Earth Resources Laboratory, Slidell, LA (NASA/ERL). The results of the interpretation of aerial photography and the processed aircraft scanner data were compared to identify apparent weak areas in either approach. The chi square test demonstrated that there were no significant differences between results obtained using computer-implemented techniques and those using conventional aerial photo-interpretation techniques. Phase II of the project will involve monitoring selected coal strip mines in the West by EMSL-LV and continued research on pattern recognition techniques by ERL. Phase III will include tests of the system in an operational mode by EMSL-LV with continued software development from NASA/ERL. (Majtenyi-IPA)

WET COOLING TOWER BACKFITTING ECONOMICS,
Iowa Univ., Iowa City. Div. of Energy Engineering; and Iowa Univ., Iowa City. Div. of Research Engineering.
T. E. Croley, II, A. R. Giaquinta, and V. C. Patel.
Journal of Power Division, Vol 104, No 2, p 115-130, April 1978. 9 fig, 7 fig. EPA 68-02-0430, USDA 14-31-0001-9015, 14-31-0001-5201.

Descriptors: *Economics, *Analytical techniques, *Cooling towers, *Closed-cycle cooling, *Costs, *Powerplants, Methodology, Computer programs, Open-cycle cooling, Equipment, Federal Water Pollution Control Act Amendments of 1972, Operation and maintenance, Backfitting.

A technique is presented for evaluating the cost of backfitting a power plant or unit currently using open-cycle cooling with a closed-cycle mechanical-draft crossflow wet cooling tower. Many existing steam-electric plants with open-cycle cooling will be required by provisions of the Federal Water Pollution control Act Amendments of 1972 to backfit a closed-cycle system. Major economic factors are: (1) installation cost; (2) additional equipment and design changes in existing equipment; (3) plant downtime for changeover; (4) provision of additional generating capacity to replace power consumed by the closed-cycle system; (5) operation and maintenance costs of cooling towers; (6) operation cost of replacement capacity; and (7) additional cost of power generation due to decrease in plant efficiency. Basic assumptions, equations, and background data are presented, and components of capital and operating costs are described. Differential capital and operating costs are combined by the levelized annual cost method to obtain the unit excess costs of energy production resulting from backfitting. The technique is illustrated with a specific unit operating at constant full load, for which cost figures and normalized curves showing the dependence of maximum capacity loss, excess fuel consumption, and evaporative water loss on tower size are given. An analytical computer program is described. (Lynch-Wisconsin)

A SOCIO-ECONOMIC APPROACH TO WATER POLLUTION LAW ENFORCEMENT IN ENGLAND AND WALES,
Newcastle-upon-Tyne Univ. (England). Dept. of Economics.
D. J. Storey.
International Journal of Social Economics, Vol. 4, No. 3, 1977, p 207-224. 6 tab, 20 ref.

Descriptors: *United Kingdom, *Effluents, *Water pollution control, *Law enforcement, *Pollution taxes(Charges), *Water quality standards, *Regulation, England, Wales, Litigation, Rivers, Costs, Legal aspects, Air pollution, Oil pollution, Economics, Social aspects, Equations, Economic analysis.

The present consent system in the United Kingdom for controlling direct effluent discharges into rivers is compared to an effluent pricing system, from the standpoint of law enforcement. It is concluded that it is not possible to determine the relative success of the two policies, because of difficulties in assessing the amount of compliance now achieved through 'arm-twisting'--that is, threats of litigation--by river authorities and the Alkali Inspectorate. Current enforcement policy is based on cooperation rather than confrontation, with litigation resorted to only after other methods have failed. Empirical data indicate that if firms minimize costs, a barely positive tax level will result in limitation of discharges at the plant level to a quantity about equivalent to those under the conciliatory approach, assuming litigation to be the only enforcement mechanism. Including arm-twisting in the evaluation, however, makes judgment difficult. It appears, nevertheless, that few of Stigler's law enforcement agency rule s are followed by environmental agencies in England and Wales; any proposals for establishing a unified inspectorate should be tested against these rules. The system of law enforcement prior to 1974 is outlined, and a comparison is made between enforcement methods for breaches of air and water pollution, and illegal discharges of oil. (Lynch-Wisconsin)
W79-00245

ECONOMIC ANALYSIS OF SELECTED FEATURES OF MUNICIPAL WASTEWATER CONSTRUCTION GRANT LEGISLATION,
Environmental Research Center, Research Triange Park, NC.
M. Rose, and J. Goldstein.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 619, Price codes: A07 in paper copy, A01 in microfiche. Publication No. EPA-600/5-77-011b, August 1977. 137 p, 11 tab, 6 ref.

Descriptors: *Federal Water Pollution Control Act Amendments of 1972, *Federal Construction Grant Program, *Treatment facilities, *Construction costs, *Economic efficiency, *Subsidies, Equity, Economics, Grants, Waste water treatment, Municipal wastes, Cost-sharing, Incentives, Resource allocation, Water pollution control, Legislation, Use rates, Cost-benefit analysis.

The Federal Construction Grant Program for subsidizing construction of municipal wastewater treatment facilities is evaluated, concentrating on three major aspects: (1) grant formula, (2) allotment funding process, and (3) industrial cost recovery. Existing legal provisions are shown to be ineffective in encouraging cost-effectiveness and in promoting equitable distribution of federal grant funds. Recommended improvements: (1) Provide higher cost-sharing rates and larger funding authorizations for secondary and higher-level treatment projects. (2) Supplement the grant program with a subsidy based either on operation and maintenance or on degree of abatement achieved to compensate for the absence of effluent charges. (3) Divide grant allotments into two portions, one based on cost-effectiveness of the project, and

one based on equity in which a community's pollution control costs are related to fiscal capability. (4) Return cost-recovery funds to the U.S. Treasury or Construction Grant Program for redistribution to highest priority projects, or at a minimum eliminate the local discretionary fund which currently can be used to finance projects unrelated to pollution control. The current grant program favors higher cost projects because it subsidizes only grant-eligible construction costs, and because of cost-recovery provisions relating to industrial use of public facilities. (Lynch-Wisconsin)
W79-00246

COST ESTIMATES FOR CONSTRUCTION OF PUBLICLY-OWNED TREATMENT FACILITIES, 1974 'NEEDS' SURVEY, FINAL REPORT TO THE CONGRESS.
Environmental Protection Agency, Washington, DC. Municipal Construction Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 682, Price codes: A03 in paper copy, A01 in microfiche. February 1975. 24 p, 4 tab, 2 append.

Descriptors: *Construction costs, *Estimated costs, *Treatment facilities, *Waste water treatment, *Federal Water Pollution Control Act Amendments of 1972, Costs, Sewage treatment, Grants, Subsidies, Surveys, U.S. Environmental Protection Agency, Economics, Forecasting, Storm water.

A 1974 state-by-state cost estimate survey for wastewater treatment facilities was conducted by the U.S. Environmental Protection Agency in compliance with the Federal Water Pollution Control Act Amendments of 1972 as further amended by PL 93-243. Estimates obtained were for meeting 1983 water quality goals, and are intended as a possible basis for allocation of construction grant funds authorized after 1975. This final report presents cost estimates both as originally received and as corrected to eliminate clerical reporting errors. In addition, EPA adjustments are given based on evaluation of technical validity of cost estimates and identification of data anomalies that would treat some states unfairly if the estimates were used in a grant allocation formula. Cost categories with EPA-adjusted figures are: (1) secondary treatment, $12.6 billion; (2) facilities required by more-stringent water quality standards, $15.7 billion; (3A) correction of sewer infiltration/inflow problems, $5.3 billion; (3B) major sewer rehabilitation, $7.3 billion; (4A) collector sewers, $17.5 billion; (4B) interceptor sewers, $17.8 billion; (5) correction of combined sewer overflows, $31.1 billion; and (6) treatment and/or control of stormwaters, $235 billion. It is recommended that only Categories 1, 2, and 4B be used for allocation purposes, as the other categories could not be adjusted to correct unevenness in the data. (Lynch-Wisconsin)

ASSESSMENT OF THE ENVIRONMENTAL IMPACTS ON THE BAN ON IMPORTS OF PCBS,
Versar, Inc., Springfield, VA.
R. P. Burruss, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 225, Price codes: A08 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA-560/6-77-007, July 1977. 164 p, 5 fig, 12 tab, 3 app, 68 ref.

Descriptors: *Polychlorinated biphenyls, Import, Economics, Foreign trade, Path of pollutants, Mineral industry, Mining, Chemical wastes, Equipment, Industries, Water pollution sources, Organic compounds, Aroclors, *Water quality standards, *Polychlorinated terphenyls, *Industrial chemicals.

This report summarizes an investigation into the uses of imported polychlorinated biphenyls (PCBs) in the United States. Imported PCBs are presently used only for the maintenance of certain mining machinery. In addition, PCBs are present as a significant impurity in polychlorinated terphenyls (PCTs) imported for use in investiment casting waxes. Importation of PCBs for these uses will be banned after 1977 by the Toxic Substances Control Act, unless exemptions are allowed in accordance with the provisions of the Act. The recent Directive of the Council of the European Communities (EEC) prohibits use of PCBs and PCTs in investment casting waxes, but allows continued use of PCBs in mining machinery in Europe. VEGETATIVE STABILIZATION OF DREDGE SPOIL IN NORTH FLORIDA,
Florida A and M Univ., Tallahassee.
C. L. Coultas, G. A. Breitenbeck, W. L. Kruczynski, and C. B. Subrahmanyam.
Journal of Soil and Water Conservation, Vol. 33, No. 4, p 183-185, July-August 1978. 2 fig, 2 tab, 15 ref. Coop. St. Res. Serv. 516-15-27.

Descriptors: *Dredging, *Grasses, *Florida, Vegetation, Vegetation establishment, Estuarine environment, Coastal marshes, Coastal engineering, Estuaries, Fertilizers, *Dredge spoil, *Vegetation stabilization, Panic grass, Needlerush, Cordgrass, Saltgrass, Sandy spoil, Sea oats.

A North Florida estuary was the site for planting a sandy dredge spoil with panic grass, sea oats, and American beachgrass supertidaly, and needlerush, cordgrass, and saltgrass intertidally. Supertidal plants were fertilized at rates of 0, 100, and 200 pounds per acre with 10-10-10 fertilizer twice during the growing season. Fertilization increased total biomass of panic grass and height of sea oats. The 200-pound rate increased growth of beachgrass roots and rhizomes. Fertilization also increased the nitrogen, phosphorus, and potassium concentrations in some plants. Survival was poor among plants in the intertidal zone, probably because of the stress created by current and waves. (Roberts-ISWS)

SAFETY ASPECTS OF TOXIC AND HAZARDOUS SPILLS,
Wood (William S.) and Associates, West Chester, PA.
W. S. Wood.
Available from Copyright Clearance Center, Inc., New York, NY as 0065-8812-78-9831-0178 ($0.75). In: Water -- 1977, AIChE Symposium Series, Vol. 74, No. 178, edited by G. F. Bennett, p 11-14, 1978.

Descriptors: *Safety, *Accidents, *Water pollution effects, *Toxicity, Safety factors, Chemicals, Corrosion control, Control system, Explosions, Burning, CHEMTREC, Hazards, Spills.

Spills of toxic substances which can occur through transportation accidents or various mechanical failures can have a variety of effects depending on the nature of the material spilled and where the accident occurs. Injuries can be incurred through direct contact with materials, such as corrosive chemicals or toxic fumes, and indirectly, through explosions and fires caused by ignition of flammable materials. The best control measures are improved design and adequate emergency planning. An example of an emergency assistance plan is CHEMTREC, operated since 1971 by the Manufacturing Chemists Association, Washington, D.C. CHEMTREC maintains a telephone service available to police and firefighters all over the country to supply vital information on handling dangerous spills. Several other programs and publications related to safety and handling of toxic spills are noted, including: Loss Prevention Symposia, held by AIChE, the 'Emergency Action Guide' published in 1976 by the U.S. Department of Transportation, and a training course for emergency services being developed by the National Fire Protection Association which was to be completed in November 1977. Descriptors: *Safety, *Accidents, *Management, *Control, *Toxicity, Industrial plants, Methodology, Planning, Hazards, CHEMTREC, OHM-TADS, Control systems, Regulation, Pollution, Chemicals, Spills.

In view of government plans to increase regulation over handling of toxic substances, companies involved in this area must develop programs for control of such materials. The first step towards an effective management plan is learning applicable regulations and determining how they affect the particular installation. Next, an appropriate plan can be made and implemented. Factors to be considered are: potential sources of trouble, backup systems, containment procedures in case of accident, and detection monitors. An inventory of resources available to the plant is recommended and outside hotline information systems should be investigated, such as CHEMTREC, run by the Manufacturing Chemists Association and OHM-TADS, a computerized information system on hazardous material run by the Environmental Pro-

ection Agency. Specific methods are noted for handling spills on land and in water. For instance, materials like polyurethane foams and silica gels are used to contain toxic spills on land and insoluble toxic substances can be filtered or screened. (See also W79-00342) (Majtenyi-IPA)

A STUDY OF COASTAL POLLUTION AND AGENCY INTERFACE,
University of Southern Mississippi, Hattiesburg. Coll. of Business Administration.
C. P. Cartee, and D. C. Williams, Jr.
Water Resources Bulletin, Vol. 14, No. 5, p 1167-1175, October 1978.

Descriptors: *Water pollution, *Coasts, *Agency-government interface, Regulation, Mississippi, Municipal governments, Board of Health, Air pollution.

The 26-mile man-made beach bordering part of Mississippi's Gulf Coast and the contiguous Mississippi Sound waters provide an important recreational and tourist attraction for that area. Being the tourist nucleus for the State, announcements in September 1973 by the Mississippi Air and Water Pollution Control Commission and the State Board of Health that Sound waters had reached a level of pollution that made them potentially dangerous for body contact was met with a myriad of responses. The resulting multigovernmental, multi-agency interface that resulted in trying to deal with the situation highlighted the type of problems that can arise when social, economic, political, and legal forces come to bear on a sensitive area. Questions of jurisdictional and legal authority to act, tourist industry economic pressures, and water quality testing and monitoring procedures were representative of the type of problems of articulation that it is essential between federal, state, and local agencies vested with responsibilities, such as monitoring water quality and protecting public health. This paper develops some of the interface complexities that emerged in dealing with this problem and makes selected recommendations for other areas that may potentially face similar situations. REGIONALIZATION OF STORMWATER RESPONSE FOR THE TENNESSEE VALLEY USING THE LAG MODULUS CONCEPT,
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
D. J. Jessup.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 138, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis. June, 1977. 94 p. 37 fig, 14 tab, 24 ref, append. OWRT A-046-TENN(2), 14-34-0001-7090.

Descriptors: *Stormwater, *Storm runoff, *Rainfall-runoff relationship, Hydrologic data, *Tennessee Valley, *Regional analysis, Urbanization, Runoff, Hydrographs.

Stormwater response was regionalized using hydrologic data from 17 urban and rural basins (0.24 to 117 sq. mi.). Lag time, the difference between 50% of runoff and rainfall excess volumes, is related to lag modulus (constant for a given land use) and the weighted rain excess intensity for the storm to the -0.4 power. This relation was derived from kinematic wave theory. Lag times were computed from optimized response functions associated with the TVA Stormwater (Double-Triangle) Model. Lag modulus was regionalized in terms of 8 significant watershed characteristics using principal components regression. The regionalization model facilitate simulation of the effects of stormwater response associated with urbanization.

A PILOT PLANT TRIAL FOR OZONE STERILIZATION OF FISH HATCHERY WATER,
Idaho Univ., Moscow.
T. J. Morrison.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 045, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, October 1977. 113 p, 33 fig, 11 tab, 20 ref, 6 append. OWRT A-053-IDA(2), 14-34-0001-6013.

Descriptors: Fish, *Fish hatcheries, *Fish diseases, *Ozone, Ammonia, Nitrates, Water chemistry, Nitrification, Water quality, Disinfection, Waste water treatment, Water pollution treatment.

An ozone pilot plant was installed at the Dworshak National Fish Hatchery to examine the efficacy of sterilizing makeup water entering this recycle hatchery. The pilot plant actually consisted of two separate systems operated together . A recycle system consisting of two fish tanks, a clarifier and biofilter was in operation prior to this study. An ozone system consisting of a Grace ozone generator (later replaced by a Welsbach generator) and a Grace contacting column was installed for this study. The ozone pilot plant supplied the makeup water to the existing recycle system. The pilot plant was run with approximately 125 pounds of cutthroat and one-half pound of steelhead fry. Recycle rate was 30 GPM and makeup rate was 3 GPM. At the conclusion of the pilot plant study, an economic comparison was made of an ozone system and an ultraviolet system. The basis for comparison was a proposed 650 GPM system to be installed at Dworshak. Although the ozone treatment system requires a capital investment of $164,000 as opposed to $90,000 for an equivalent size ulraviolet system and an annual cost of almost $17,000 as opposed to $12,000 for the UV system, this study demonstrates the increased cost may be justified. The ozone system gave consistently greater sterilization efficiency than the ultraviolet system. It also showed consistently lower ammonia level and more uniform BOD concentrations. All of these effects would enhance fish survival.

WASOPT USERS MANUAL: AN INTEGER PROGRAMMING METHODOLOGY FOR MUNICIPAL/REGIONAL WATER SUPPLY PLANNING,
Utah Water Research Lab., Logan.
T. C. Hughes, P. E. Pugner, and G. Clyde.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 575, Price codes: A06 in paper copy, A01 in microfiche. Publication PRWG198-2, December 1977. 102 p, 17 fig, 2 tab, 5 append. OWRT B-145-UTAH(2). 14-34-0001-7132.

Descriptors: *Systems analysis, *Methodology, Water supply facilities, *Mathematical models, Model studies, Regional analysis, Planning, Optimization, Cities, City planning, *WASOPT methodology.

A systems analysis methodology is presented for identifying the least cost combination of municipal water supply facilities and operating rules. The planning package called WASOPT (Water Supply Optimization) includes the following procedures and capabilities: (1) The water supply and demand data (both existing and potential) are input in response to interactive statements from the computer in a form similar to that required for a manual solution to the planning problems; (2) WASOPT generates a mathematical model representing the problem's objective and constraints as defined by the input data; (3) the optimal solution is determined by use of a mixed integer programming algorithm; (4) the mixed integer programming solution is reported in a format designed especially for the municipal problem (in addition to the normal optimization package output). The procedure can be applied to regional or single complex municipal problems without revision to the generalized model form. The internal generation of the mathematical model totally eliminates the time consuming and error prone task of manually developing the model constraints and also allows use by planning engineers who have no previous knowledge of computer science or mathematical programing.

SHORTEST PATH PROBLEMS IN HYDROGEOLOGY,
Food and Agricultural Organization of the United Nations, Rome (Italy). Land and Water Development Div.
R. G. Thomas.
Ground Water, Vol. 16, No. 5, p 334-340, September-October 1978. 3 fig, 7 tab, 10 ref.

Descriptors: *Scheduling, *Hydrogeology, *Optimization, Operations research, Management, Networks, Planning, Groundwater, Theoretical analysis, *Shortest path, *Minimal spanning tree.

Many aspects of groundwater involve shortest path between two points and shortest round trips to many points. These problems are included in network theory, which is not easily available to groundwater specialists. This paper introduced some of the techniques which can be solved by hand for fairly small projects. Larger networks often can be divided into districts, each of which may then be amenable to hand solution. The

minimal spanning tree problem was described as background to the more useful problem of shortest path between two particular nodes. The matrix method is the simplest solution for the shortest path between all pairs of nodes and can easily be solved by hand for 30 or less nodes. This data can be used to determine which node is most centrally located and to determine a shorter round trip from one node to all others, returning to the origin. The matrix can be used for partial routes and for routing of two or more vehicles. (Visocky-ISWS)

MODELING FOR ORGANIZATIONAL DECISION-MAKING: PROFITS VS. SOCIAL VALUES IN RESOURCE MANAGEMENT,
State Univ. of New York at Albany. School of Business.
H. Kahalas, and D. L. Groves.
Journal of Environmental Management, Vol. 6, No. 1, January 1978, p 73-84. 2 tab, 11 ref.

Descriptors: *Model studies, *Decision making, *Multiple purpose, *Forest management, *Goal programming, *Watershed management, *Analytical techniques, *Social values, *Alternative planning, Profit, Natural resources, Economics, Forestry, Social aspects, Forests, Recreation, Forest watersheds, Goals, Priorities, Methodology

A goal programming model is developed for multiple-use forest usage as a component of watershed management. The model is initially examined from an industrial perspective, then the priority structure is modified to coincide with societal forest use goals. Goal programming is superior to linear programming in forestry management in that it can handle conflicting goals ghrough the priority system and allow attainment of a solution by minimizing deviations from each specified goal. All constraints are treated as goals with associated priorities, so that values assumed by the deviational variables of each constraint determine the extent of goal achievement. Prioritized five-year industrial goals of a timbering company in the example are: (1) at lest $10,000 total profit, (2) at least 5% annual growth in net worth, (3) at least $3000 in dividends/yr, (4) watershed management on at least 200 acres/yr, (5) at least 150 wilderness acres reserve, and (6) at least 1000 acres provided for recreation. The company owns 3260 acres of forest land. In the first computer run all but goal (5) were at least partially attained. As revised according to social values, the priority ranking is: (1) watershed management, (2) wilderness preserve, (3) recreation, (4) profit, (5) net worth, and (6) dividends. In the new computer run, all but goal (6) are at least partially achieved. Incorporation by industry of societal goals is likely to have positive benefits for the company. (Lynch-Wisconsin)

DYNAMIC PROGRAMMING AND THE PRINCIPLE OF OPTIMALITY: A SYSTEMATIC APPROACH,
Princeton Univ., NJ. Dept. of Civil Engineering.
M. Sniedovich.
Advances in Water Resources, Vol 1, No 4, p 183-190, June 1978. 20 ref.

Descriptors: Water resources, *Dynamic programming, *Optimization, *Bellman's principle, Decision making, Equations, Mathematical models, Management, Systems analysis.

The dynamic programming recursive procedure has provided an efficient method for solving a variety of sequential decision problems related to water resources systems. In many investigations, Bellman's principle of optimality is used as a proof for the optimality of the dynamic programming (DP) solutions. Herein, the dynamic programming procedure is systematically studied so as to clarify the relationship between Bellman's optimality principle and the optimality of the DP solutions. The main result is that, although the principle is valid, in order to use it as a proof for the optimality of the DP solution, certain modeling requirements must be met. The model presented herein provides a convenient framework for the analysis of DP problems encountered in water resources management studies. The results derived resolve few of the fundamental questions raised in the literature regarding the validity of Bellman's principle of optimality and the optimality of the dynamic programming solutions. Descriptors: *Model studies, *Water resources development, *Optimum development plans, *Planning, *River basin development, *Reservoir yield, Economic efficiency, Operations research, Dynamic programming, Water supply, Water demand, Welfare(Economics), Econometrics, Pricing, Computer programs, Optimal timing, Demand curves.

A general multi-period planning model for the optimal timing, sizing, and sequencing of reservoir additions to surface water supply is presented. The objective of the model is the maximization of net economic efficiency benefits subject to hydrologic system constraints. The model is designed to handle system increments which are unique and interdependent. Since firm water, the product of the system, is dependent on existing reservoir sizes, configurations, and hydrologies a rational operating scheme is incorporated into to the optimization. A price-sensitive demand curve which changes according to a prescribed growth rate is used. Firm water demand is thus sensitive to changes in price and time as opposed to most fixed demand requirement approaches. Benefits are measured by the willingness-to-pay cncept. Known reservoir cost relationships which are a function of project capacity determine cost relationships which are a function of project capacity detemine costs. A forward dynamic programming algorithm is used for solution. The model is tested with an application to the Eel River Project in Northern California. The discount rate, growth rate, and demand elasticity are parameterized and tested over several values. (Yeh-Calif)

A COMPARATIVE STUDY OF COMMUNITY RESPONSE TO WATER RELATED PROBLEMS,
Delaware Univ., Newark. Dept. of Sociology.
D. Wenger, and T. Leitko.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 688, Price codes: A05 in paper copy, A01 in microfiche. Completion Report, December 22, 1977. 85 p, 26 tab, 30 ref. OWRT A-031-DEL(2). 14-34-0001-6008.

Descriptors: Social aspects, *Social change, *Urban sociology, *Decision-making, *Water resources, Development, *Community development, *Attitudes, *Community power.

This study examines the nature of local power actors' definitions, perceptions, and proposals for solving water resource and general community problems. The responses of power actors in six communities in Delaware are compared with those from power actors in ten midwestern communities. In general the findings from Delaware tend to support the prior midwestern research. In both settings while local leaders are aware of local water resource problems, these are not important, salient concerns to them. In Delaware water resource problems are viewed as being less serious than was the case in the midwest. In both settings, however, there is little consensus among local leaders concerning the severity of local water resource and general problems. Also, there is a lack of faith in the local communities' ability to solve water resource problems by themselves. However, overall the level of inactivity with respect to water resource problems is perceived to be less in Delaware than in the midwest. Furthermore, the power actors in Delaware generally held positive or neutral attitudes toward the helpfulness and effectiveness of state, county, and federal agencies with respect to water resource planning. In addition, a comparison was made of community residents perception of problems with those of local power actors in Delaware. As compared to the power actors, local residents are more likely to perceive the existence of water resource problems, are less likely to see the local community as being able to solve them, and are less likely to perceive any local activity to solve them. Finally, residents in Delaware perceive protest activities as being the most effective devices for having their political demands met.

PROTECTION OF OUTDOOR RECREATION VALUES OF RIVERS.
Heritage Conservation and Recreation Service, Washington, DC.
1978 Nationwide Outdoor Recreation Plan, Task Force Report. 39 p, 4 append.

Descriptors: *River protection, *Recreation, *Wild rivers, *Conservation, *Wild River Act, Scenery, Suwannee River, Housatonic River, River conservation, Georgia, Florida, Connecticut, Massachusetts, Environment, Ecology, Wild and Scenic Rivers System, River regulation, Rivers, Interstate rivers, Federal Government, Legislation.

Issues surrounding river protection in America are examined and action alternatives for resolution of these issues are proposed. Four major issues are identified: (1) protection of rivers is viewed as the exception rather than the rule; (2) there is no national focus on recreation and urban rivers; (3) wild and scenic river protection has been slow, costly, and inadequate; and (4) Federal leadership and coordination is inadequate. A number of options for Federal action are proposed. Among the legislative options are: authorization of a River Conservation Revolving Fund to be administered by the Secretary of the Interior; and amendment of the Wild and Scenic Rivers Act to provide financial assistance to States to administer nationally designated rivers. Other options relate to possible executive action directing all Federal agencies to give special recognition and protection to designated wild and scenic river areas, including studies on those areas considered potential additions to the National Wild and Scenic Rivers System. In addition, 14 specific suggestions for agency actions are made for improving and strengthening river protection and conservation. Case studies on the Suwannee River in Georgia and Florida and the Housatonic River in Connecticut and Massachusetts are provided. (Majtenyi-IPA)

NEEDS OF PRIVATE FOR PROFIT ENTERPRISES IN OUTDOOR RECREATION.
Heritage Conservation and Recreation Service, Washington, DC.
1978 Nationwide Outdoor Recreation Plan, Task Force Report. 55 p.

Descriptors: *Recreation, *Private recreational industry, *Recreation demand, Recreation facilities, Private concessions, National parks, Parks, Energy consumption, Legislation, Land management.

With continued public demand for greater recreational opportunities, the private sector is demonstrating its competence to provide clean, wholesome and innovative recreation. This creates jobs, incomes and tax revenues; however, Federal agencies are limiting and sometimes even prohibiting activities of the private sector. New Federal policy is needed to ensure that Federal recreation and tourism agencies clear with private sector before purchasing and developing land, and existing policies need to be revised to permit greater support and participation by the private sector on presently-owned and managed Federal recreation lands. Problems and liabilities facing private sector business in the recreation and sports area are described along with current efforts to resolve these issues. Such problems include costs of insurance, regulatory confusion and over-regulation by government, and difficulties involved with private concessions operating on public lands. In each case the discussion includes a statement of issue, background, and a description of current efforts to resolve the problem. Other issues discussed are: highway signs, technical assistance and education to aid private sector decision makers, energy management, nationwide outdoor recreation policy development and the role of the private sector in forming it. Descriptors: Social Aspects, *Social impact, Decision making, Leadership, Resistance, Resistance networks, *Social values, *Kentucky, Reservoirs, Environmental effects, *Pre-impoundment, Organized resistance, Voluntary association, Social cost, Sentiment systems.

This is a case study of a group organized to resist the construction of an Army Corps of Engineers reservoir project located in Eastern Kentucky. The account describes how a group of landowners organized and enacted an increasingly complex strategy of resistance. Within this framework perceived costs, leadership and authority and group organization are considered. The primary research method employed was that of repeated interviews with members of the resistance organization who were identified as key informants. These interviews were carried out on both structured and unstructured bases. The formal analysis of the voluntary association data emphasized the process of resistance. That is, the report depects the evolution of persisting resistance oranization. The conclusions include recommendations to both project resisters and project planners. (Huffsey-Kentucky)

CONSTRAINTS TO WELFARE GAINS UNDER EXTENDED JURISDICTION FISHERIES MANAGEMENT: DISCUSSION,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
R. Marasco.
American Journal of Agricultural Economics, Vol 59, No 5, p 885-886, December 1977. 1 ref.

Descriptors: *Fisheries, *Fish management, *Commercial fishing, *Economics, *Jurisdiction, *Welfare(Economics), Model studies, Research priorities, Fish conservation, Institutional constraints, Regulation, Economic efficiency, Fishery Conservation and Management Act of 1976, Theoretical analysis, Political constraints.

This critique of Huppert's 1977 paper agrees with the author's list of constraints to welfare gains in U.S. fisheries management but adds: (1) knowledge deficiencies associated with both biological and economic fishery systems, and (2) cost of instituting and enforcing regulatory programs. Development of more refined and realistic empirical bioeconomic models would facilitate

enactment of regulations by the councils designed to promote sound fishery operations. However, data inadequacy coupled with data acquisition costs hinders development of such models. Data is needed on salinity, temperature, prevailing currents, and number and feeding habits of stock as well as other fish species. Deficiencies also exist in the economic data base, including recreational use of fish, nature of food fish consumption, substitutability among species by consumers, restaurant consumption, foreign fish markets, competition in the processing sector and its capacity and costs, harvesting costs and capacity, and fishing effort. Costs associated with implementation and enforcement depend upon the nature of the regulatory measures selected. Enforcement costs for programs requiring either aerial or ship surveillance will be high. (Lynch-Wisconsin)

THE DEMAND FOR CLEAN WATER: THE CASE OF THE CHARLES RIVER,
Department of Justice, Washington, DC. Antitrust Div.
F. W. Gramlich.
National Tax Journal, Vol 30, No 2, p 183-194, June 1977. 5 tab.

Descriptors: *Charles(MA), *Water quality control, *Boston(MA), *Surveys, *Attitudes, *Willingness to pay, Cost-benefit analysis, Massachusetts, Social values, Regression analysis, Cities, Swimming, Economics, Rivers.

Costs and benefits were judged about equal in the case of swimmable water in the Charles River, according to a willingness-to-pay survey of 165 families in metropolitan Boston. Determinants of willingness to pay were isolated using regression analysis, and an estimate of aggregate benefit from improving water quality was developed from the regressions and compared to resource costs. The estimated range of aggregate benefits is $8.8-21.9 million, an average of $15.4 million, while estimated aggregate costs are $16.7 million. Interviews and questionnaires were administered September-November 1973. Family income, education, proximity of home and workplace to the river, graduate student status, and probability of future residence were all positively correlated with willingness to pay. Residence in the region as a percentage of age, percent of past life in the area and age alone were inversely related to willingness to pay, and ownership produced mixed results. Independent variables considered in the analysis were: (1) discretionary permanent family income, (2) graduate student status, (3) age of respondent, (4) completion of high school, (5) completion of college, (6) residence distance from the river, (7) percent of family working or attending school near the river, (8) product of ownership and variable 9, (9) probability of future residence in the area, (10) percent of past life in the area, (11) hrs of family river recreation, and (12) swimming ability. NATURAL RESOURCE ECONOMICS: THE UPSETTING DISCIPLINE,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
M. M. Kelso.
American Journal of Agricultural Economics, Vol. 59, No. 5, December 1977, p 814-823. 15 ref.

Descriptors: *Natural resource economics, *Economics, *Environmental economics, *Agricultural economics, *Theoretical analysis, *Socioeconomic theory, Public lands, Australia, Nauru Island, Goals, Land values, Value, Land economics, Land use, Output, Maximization.

This paper, the test of a lecture, describes the author's efforts during his academic career to rationalize natural resource economics (formerly land economics) with conventional economic theory, particularly agricultural economics. The basic conflict is seen as a question of goals; the goal of standard economics is output maximization within constant external variables of preferences and institutions, taken from a short-run perspective, which is replaced in natural resource economics with the goal of maintaining or improving capital stock and the bodies and minds of the aggregate system in a long-run or even infinite time span, and in a closed system. Boulding's 1966 paper on earth viewed as a spaceship rather than as a limitless plain pointed the direction that resolution of the paradox of natural resource economics must take. This vision requires traumatic adjustment of ethical, religious, cultural, and intellectual systems. The problem of public lands is also discussed, here portrayed as a conflict of landlord-tenant relationships versus private ownership of those lands. Whereas a rancher can correctly be visualized as a private firm, the structure, role, and behavior of a public landlord has never been resolved. The issue of aggregate agricultural land values is discussed, with examples from Australia and Nauru Island in the southwest Pacific Ocean. (Lynch-Wisconsin)

BRUSHLAND WATERSHED FIRE MANAGEMENT POLICY IN SOUTHERN CALIFORNIA: BIOSOCIAL CONSIDERATIONS,
California Univ., Berkeley. Dept. of Forestry and Conservation.
R. G. Lee, and T. M. Bonnicksen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 523, Price codes: A05 in paper copy, A01 in microfiche. Technical Completion Report Contribution No. 172, ISSN 0575-4941, August 1978, 74 p. (California Water Resources Center Project UCAL-WRC-W-499). OWRT-A-058-CAL(1).

Descriptors: *Brushlands, *Watershed management, *Forest fires, Political aspects, History, *California(Southern).

Results from the Cleveland National Forest and Angeles National Forest case studies are summarized as three interpretations of brushland watershed fire management policy. A historical description of fire exclusion shows the influence of flood control and water related interest groups in shaping current policies. An abstract interpretation of the linkage between present interest-groups and watershed conditions shows that the fire exclusion policy is less to satisfy all interests than a rotation burning policy applied at individual watershed levels. A more abstract interpretation discusses the hypothesis that the fire exclusion policy persists because it stimulates increasing expenditures for fire exclusion through hazardous fuel accumulation. The report describes and evaluates the effect of restrictions on governmental spending, energy shortages, decreasing importance of local water supplies, and changes in the legal framework governing fire management on fire exclusion policy. Completion Report, The Pennsylvania State University, Institute for Research on Land and Water Resources, September 1978. 138 p, 13 tab, 10 fig, 5 append. OWRT A-048-PA(3). 14-34-0001-7080.

Descriptors: *Water supply, *Water demand, Water utilization, *Pennsylvania, Water resources, Water shortage, Water use, *Model studies, Interactive water, Energy model, *Water use functions, *Energy supply, Demand, *Linear flow model, *Optimization, Electrical generation, Energy demand, Energy supply.

Growing energy demands and dwindling energy supplies have only recently become topics of national and worldwide concern. The economic and energy crises of the 1970's have amplified these concerns. Likewise, water resources are presumed non-exhaustible and are only serious topics of interest when severe water shortages or natural catastrophies strike regional areas of the country. The two types of resources, energy and water, are vitally linked together because energy supply, conversion and end use depend heavily upon water resources. An interactive water/energy model is presented for the state of Pennsylvania. An independent water model and energy model are joined together to show the interactions between energy supply and demand with the supply of water. These interactions are depicted by water use functions for various energy sectors. Specific examples are presented for the electrical generation sectors. Two hypothetical scenarios are presented to show the use of the model as a planning tool. One scenario utilizes goal programming to optimize a number of energy uses at different priority levels. Some recommendations are offered. (Sink-Penn St)

POINT SOURCE ANALYSIS. INVENTORY, WATER DEMANDS, AND PROBLEM AREA IDENTIFICATION. (AREAWIDE WASTE TREATMENT PLAN FOR THE GREATER HOUSTON AREA. SECTION 208, PL 92-500.
Houston-Galveston Area Council, TX.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 761, Price codes: A06 in paper copy, A01 in microfiche. July 1977. 107 p, 30 tab, 2 append.

Descriptors: *Water management, *Water demand, *Water supply, *Water utilization, *Water policy, *Water quality, *Houston, *Galveston, Federal Water Pollution Control Act, Water allocation(Policy), Groundwater, Surface water, Waste water, Municipal wastes, Industrial wastes, Water pollution, Surface waters, Data collections, Future planning(Projected), Water quality.

A point source inventory was carried out to locate and characterize significant industrial discharge to the municipal sewer system and directly to surface waters within the greater Houston area. Data, such as identity, locations, and characterization of sources were incorporated into storage-retrieval systems and discharge points were plotted on location maps. Water demands were modeled for the planning period 1975 to 1995 and projected according to sub basin and user. Separate equations were used for industrial, agricultural, power generation, and domestic categories. It is predicted that, in general, water demands will exceed supplies in future years, although a number of factors will mitigate the deficits. These factors are described in detail and attempts were made to identify which sources could meet specific demands. Also, efforts were directed toward allocating demands to groundwater or surface water supplies and ordering allocations by user category and sub basin. Finally, the existing water quality and projected wasteloads were identified for specific stream segments. Ten of these segments which are not expected to meet water quality standards were designated problem areas. The methodologies used to project industrial wasteload and municipal wasteload are described in the appendices. (Majtenyi-IPA)

WATER USAGE REQUIRES PLANNING,
Universal Oil Products, Inc., Saint Paul, MN. Johnson Div.
R. J. Havrilak, Jr.
Johnson Driller's Journal, Vol. 50, No. 4, July-August, 1978, p 4-5. 1 fig.

Descriptors: *Water utilization, *Water management(Applied), *Planning, Water demand, Water quality, Water permits, Water resources development, Ground water, Surface water.

Over 420 billion gallons of water are used each day in the United States. This usage is controlled by water resources development plans that vary in complexity and scale from an individual water source to an industrial or municipal water supply. The water quantity and quality for the intended use should first be determined from available data. Then, a source must be found in ground water, surface water, or a combination of both. Ground water and surface water availability maps can be obtained from state and national geological surveys. Withdrawals from surface and ground water supplies are controlled by various regulatory agencies. Where possible, a comparison of all potential sources should be made, including such considerations as reliability, treatment requirements, initial cost, maintenance and operating costs, and compliance with government regulations. Once a suitable source has been chosen it should be developed to its full potential. With ground water, this means paying attention to the aquifer characteristics, well construction, and drilling and development techniques. With surface water, special attention must be directed toward the design and siting of the intake screen, cleaning the screen, and keeping entrance velocity low--less than .5 FPS--at any point on the screen. Descriptors: *Energy, Irrigation water, *Municipal water, *Water supply, Energy analysis, *Municipal sewage treatment, Growth rates, Energy requirements.

Energy and water are linked resources. This pilot study examines the relationship between energy and water from a direction opposite to that of most studies. An evaluation is made of the energy required to supply and treat water, rather than the water requirements of energy production. The primary energy requirements for three sectors of water management--municipal water supply, municipal sewage treatment, and water for irrigation--are evaluated. Six major cities, Chicago, Denver, Los Angeles, New Orleans, San Antonio, and St. Louis, are used as indicators of the national trend in energy requirements to supply water municipalities. Nationwide data provided by the federal Environmental Protection Agency for 1977 and 1990 are used to determine the rate of change of energy required to treat municipal sewage over this period. The energy required to supply water for irrigation is estimated for three regions in the Southwest: Kern County, California; the Texas high plains; and San Carlos, Arizona. Historic trends and prospects for future development are used to estimate future energy requirements for each of these water sectors. The projections are compared to expected increases in national energy consumption. The results indicate that: (1) regional differences in the amount of energy needed to supply water are very large, increasing in some places and decreasing in others; (2) significant nationwide increases are likely for the energy required to treat sewage; and (3) noncritical short-term increases will occur in the total energy requirement to supply irrigation water, but after the year 2000, the Southwest faces an extremely difficult choice in balancing its resources of energy, water, and agricultural land, particularly in the light of its growing urban demands.

1978 Nationwide Outdoor Recreation Plan, Task Force Report. 39 p, 1 append.

Descriptors: *Water resources, *Recreation, *Environmental resources, *Water resources development, *Water policy, Wetlands, Floodplains, Coastal beaches, Lakes, Water utilization, Estuaries, Water resource programs, Federal water policy, Federal Government.

Seven national water related recreation and environmental action objectives are identified and methods for fulfilling these objectives are suggested. Topics covered include: maintenance of instream flows; evaluation and protection of wetlands, estuaries and other important areas; protection and enhancement of flood plains; direction and encouragement of maximization of cost-effective recreation opportunities, and Federal water resource development projects. Following a statement of each action objective, background related to the objective is provided, directly related authorities (statutes, Executive Orders and other Presidential documents or directives to the Executive Branch) are identified, action needs are briefly discussed, and action options are presented. The appendix provides a list of authorities cited and a brief description of applicable sections. (Gibson-IPA)

FEDERAL OUTDOOR RECREATION LAND ACQUISITION-LWCF.
Heritage Conservation and Recreation Service, Washington, DC.
1978 Nationwide Outdoor Recreation Plan, Task Force Report. 22 p. 2 tab, 1 append.

Descriptors: *Recreation, *Land development, *Land management, *Land and Water Conservation Fund(LWCF), National Park Service, Forest Service, Fish and Wildlife Service, Wild and Scenic River Act, National Wilderness Preservation Systems Act, National Recreation Areas, Federal Government, Land use.

Federal policy as it relates to Federal land acquisition for recreational, natural, and cultural resources, is examined. Included is a brief description of the Land and Water Conservation Fund (LWCF) Act of 1965, what has been accomplished with the LWCF, and what future demands are expected on the fund. At present some 27 different authorities can be used by the Forest Service, National Park Service, Fish and Wildlife Service, and the Bureau of Land Management, to obtain land for over 20 separate land categories. Also, there may be conflicts or at least ill-defined authority relating to specific land preservation acts, such as the National Wilderness Preservation System Act and the Wild and Scenic Rivers Act. It is recommended that an effective Federal policy contain a clearly stated direction, standards and guidelines for implementation, and a statement of responsibilities and process delineating appropriate agency actions. Agencies using the LWCF, their acquisition's policy, authorities, types of area acquired and acquisition priorities are listed in the appendix. (Majtenyi-IPA)

ROLES/FUNCTIONS OF FEDERAL, STATE AND LOCAL PUBLIC AGENCIES.
Heritage Conservation and Recreation Service, Washington, DC.
1978 Nationwide Outdoor Recreation Plan, Task Force Report. 39 p, 3 tab, 1 ref.

Descriptors: *Recreation, *Legislation, *Recreation facilities, *Land management, *State Government, *Local Government, Social needs, National recreation areas, State recreation areas, Conservation, Land use, National parks, Scenery, Water management, Government.

In the past, proliferation of Federal actions, aid, and assistance programs throughout some 50 bureaus, 35 offices, and numerous commissions has created confusion and inhibited coordination in the field of outdoor recreation. This review examined existing systems to determine how some policies might be changed or shifted to yield a more logical approach. The historical perspective on outdoor recreation policy is traced from pre-World War II to the present with a brief summary of the Acts and Federal studies in this field. A philosophy for recreation roles and responsibilities is defined for various segments of society. For example, the Federal role, in addition to its legislated land and water management responsibility, will primarily be supportive to the extent of providing the incentive and assistance for State and loc governments. Local governments will look t these upgraded state programs for guidanc funds, and for producing on-the-ground result The private sector will complement the Stat local-Federal role by providing additional servic and facilities where profit and price are a pa Private non-profit organizations can play a vit role in providing recreation opportunity, esp cially in flexibility, diversity and cost-effecti uses. The private citizen should take part planning at all levels to represent the user's vit poinnt of view. More detailed jurisdictional lev responsibilities for outdoor recreation are e plained for each segment listed above, but the r port stresses that the most important factor achieving an efficient recreation program is the i terrelationship and interdependence of all the segments. (Majtenyi-IPA)

THE DEVELOPMENT OF THE ELECTRICA POWER SYSTEM IN THE PACIF NORTHWEST, A PUBLIC POLICY PERSPE TIVE,
Washington Univ., Seattle.
R. G. Walton.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-287 62 Price codes: A09 in paper copy, A01 in microfich M.S. Thesis, 1976, 174 p, 6 fig, 6 tab, 2 maps, ref, 9 append. OWRT A-079-WASH(2).

Descriptors: *Electrical power system, *Pacif Northwest, Policy, *Decision-making.

The objective is to provide a description and an ysis of the development of the electrical ener system in the Pacific Northwest from the la 1950's to 1976, from a public policy perspectiv Unprecedented changes have appeared in the ele trical energy picture in the PNW in recent year and the near future promises to produce addition decisions of significant importance to the regio The arrival of large capacity thermal-electr power plants in the region (both coal and nuclea and plans for many more, have been accompani by greatly increased public attention to energy a the environment. The controversies that have e sued are complex, and the manner in which th are to be resolved is of great interest and conce to a large number of individuals and organization In spite of these facts, however, the level citizen awareness of the region's plans for electr cal power development, how these plans ha been chosen, and by whom, appears to remain at very low level. Considerable attention has be given to the historical evolution of the regio power system. This has helped to place the prese dilemma in context as the requirements placed c electric energy planners have evolved with th growth in generation and use of electricity.

NSTRAINTS TO WELFARE GAINS UNDER TENDED JURISDICTION FISHERIES NAGEMENT: DISCUSSION (ANDERSON),
aware Univ., Newark. Dept of Economics.
. Anderson.
erican Journal of Agricultural Economics, Vol. No. 5, p 883-884, December 1977. 2 ref.

criptors: *Fisheries, *Fish management, mmercial fishing, *Economics, *Jurisdiction, elfare(Economics), Fish conservation, Fishery servation and Management Act of 1976, oretical analysis, Institutional constraints, ulation, Economic efficiency, Political con- ints, Taxes.

ritique of Huppert's 1977 paper on constraints welfare gains in U.S. fisheries management ises on the definition of welfare, provisions of Fishery Conservation and Management Act of 6 (FCMA) relating to economic allocation and ciency, and recreational fishing data. Accord- to Huppert, 'welfare gains' are really potential fare gains, or more properly, the attainment of nomic efficiency. Huppert identifies five ential barriers to economic efficiency: (1) over- ing authority among states and foreign coun- ; (2) provisions of FCMA, especially restric- s on taxes as a regulation tool; (3) the regional ntation of the councils; (4) industry comination he councils; and (5) inadequate knowledge of eational fishing. National standard 5 of FCMA es that 'conservation and management mea- s shall...promote efficiency in the utilization ishery rsources; except that no such measure l have economic allocation as its sole purpose.' second phrase essentially negates the first, could more seriously retard progress toward nomic efficiency than restrictions on use of s. Preliminary guidelines for implementing MA do not entirely clarify the relative empha- o be given economic efficiency as a manage- t goal. The lack of data on recreational fishing ally a problem of lack of adequate social and nomic information in general. (Lynch-Wiscon-

TRIBUTIONAL IMPLICATIONS OF THE TENDED ECONOMIC ZONE: SOME POL- AND RESEARCH ISSUES IN THE HERY,
consin Univ.-Madison, Dept. of Agricultural nomics.
V. Bromley.
erican Journal of Agricultural Economics, Vol. No. 5, p 887-892, December 1977. 9 ref.

criptors: *Fisheries, *Fish management, stribution, *Access, *Economics, elfare(Economics), *Public policy, Jurisdic- , Model studies, Research studies, Theoretical ysis, Policy, Commercial fishing, Income dis- tribution, Economic efficiency, Social aspects, Social impact, General equilibrium models, Willingness to pay.

In economic analysis of extended fisheries jurisdiction, important insights are gained by a more careful specification of the traditional steady-state/yield-effort models, and by viewing extended jurisdiction economics in the framework of welfare theory. Fishery distribution is analyzed, a simple model is presented for assessing international distributional implications of extended jurisdiction, access to the enlarge domestic fishery is discussed, and research and policy implications are reviewed. Distributional aspects have been ignored because economists have been using the wrong conceptual framework; traditional fishery models consider fishermen mere factors of production, aggregated as 'effort', not as independent decision-making units. Applying welfare economics to the fishery problem focuses distribution as central to any policy recommendation. Considerable difference of opinion exists regarding the role of economics in determining who should have access to the fishery; various aspects of valuation of those desiring access are discussed. As devastating long-run economic losses can accure to those denied access to the fishery, it would seem logical that economics should have something to offer in such an important policy issue. Domestically, a distributionally related management program should pay careful attention to the real mobility, both monetarily and non-monetarily, of all who seek access.(See also W79-00237 and W79-00238)
W79-00236

DISTRIBUTIONAL IMPLICATIONS OF EXTENDED FISHERIES JURISDICTION: SOME RESEARCH AND POLICY ISSUES: DISCUSSION,
Rhode Island Univ., Kingston, Dept. of Resource Economics.
D. L. Hueth, and V. J. Norton.
American Journal of Agricultural Economics, Vol. 59, No. 5, p 895-897, December 1977. 9 ref.

Descriptors: *Fisheries, *Fish management, *Distribution, *Access, *Economics, *Welfare(Economics), *Public policy, Jurisdiction, Model studies, Research priorities, Theoretical analysis, Policy, Commercial fishing, Income distribution, Economic efficiency, Social aspects, Social impact, General equilibrium models, Willingness to pay.

Bromley's 1977 paper on the distributional implications of extended fisheries jurisdiction is criticized. In general equilibrium analysis of international fisheries the interdependent production possibility curves illustrated in Bromley's Figure 1 imply that complete specialization in fisheries by both countries would produce more fish than is possible. Since the assumptions of Figure 1 are basic to Bromley's international analysis, his conclusions in that section are questionable. Two aspects of Bromley's domestic analysis also cause concern: (1) He has made important implicit distribution decisions regarding allocation within each group, without which there would be no economic rent or willingness to pay for access to the fishery. (2) His calculation of willingness to pay for access is questionable. He assumes a net present value (NPV) of access of 105 for group CF and an NPV of their best alternative of 95. It is unclear why this group would be willing to pay more than 10 for the right to fish. What Bromley calculates as the NPV for access minus the NPV for the alternative would in fact represent willingness to pay for access. Bromley seems to suggest access be allocated to the highest bidder, a procedure he questioned earlier. The difference in NPV also represents maximization of rents (or benefits) to the resources, which Bromley argues is 'nonsense'. To help determine the advantageousness of a policy, the purely ordinal general equilibrium framework should be replaced by the economic surplus framework. Research needs are listed. See also W79-00236 and W79-00238. (Lynch-Wosconsin)
W79-00237

DISTRIBUTIONAL IMPLICATIONS OF THE EXTENDED ECONOMIC ZONE: SOME POLICY AND RESEARCH ISSUES IN THE FISHERY: DISCUSSION,
Oregon State Univ., Corvallis. Dept. of Agricultural and Resource Economics.
R. S. Johnston, and F. J. Smith.
American Journal of Agricultural Economics, Vol. 59, No. 5, p 893-894, December 1977.

Descriptors: *Fisheries, *Fish management, *Distribution, *Access, *Economics, *Welfare(Economics), *Public policy, Jurisdiction, Model studies, Theoretical analysis, Policy, Commercial fishing, Income distribution, Economic efficiency, Social aspects, Social impact.

Two point of criticism are given on Bromley's 1977 paper on distributional implications of the extended economic zone in the fishery: (1) A clearer distinction is needed between use of welfare theory to prescribe policy (normative) and its use in predicting consequences of policy decisions (positive). (2) Whether distribution is a dimension of economic efficiency or is a separate socially relevant variable should be clarified. Bromley goes beyond identifying distributional consequences of fishery policy and suggests fishery policies on the basis of their distributional consequences. Theoretical constructs are generally used by economists to predict consequences of alternative policies, not to prescribe policy for the greatest benefit to all. Bromley should therefore clarify when he is writing as an economist and when as a manager. In regard to the second point, Bromley argues that efficiency (or maximum net economic rent) is only one socially relevant variable, but his discussion of distribution does not explain if it should be considered another socially relevant variable or a dimension of efficiency. If the former, there are many more that also deserve consideration. If the latter, distributional dimensions of other socially relevant variables must be accounted for. It is likely that commercial fishermen would rank efficiency low on a list of socially relevant variables. Greater consistency of example of the use of welfare economics is also desirable. (See also W79-00236 and W79-00237) (Lynch-Wisconsin)

CONSTRAINTS TO WELFARE GAINS UNDER EXTENDED JURISDICTION FISHERIES MANAGEMENT,
National Marine Fisheries Service, La Jolla, CA.
D. D. Huppert.
American Journal of Agricultural Economics, Vol. 59, No. 5, p 877-882, December 1977. 17 ref.

Descriptors: *Fisheries, *Fish management, *Commercial fishing, *Economics, *Jurisdiction, *Welfare(Economics), Fish conservation, Fishery Conservation and Management Act of 1976, Income distribution, Theoretical analysis, Institutional constraints, Regulation, Economic efficiency, Political constraints, Taxes.

With extension of the U.S. fishery conservation zone to 200 miles off the Atlantic and Pacific coasts and adoption of management economic objectives in the Fishery Conservation and Management Act of 1976 (FCMA), welfare gains become important. Constraints to such gains include: (1) lack of comprehensive and unified management authority; (2) certain provisions of FCMA (e.g., restricting use of fees or landings taxes; (3) regional orientation of the fishery councils and their domination by industry spokesmen; and (4) inadequate economic knowledge of recreational fisheries. FCMA establishes conditions for im-

proved economic performance: (1) establishment of federal authority over areas broad enough to allow unified management; (2) creation of regional councils to develop management plans with industry and scientific cooperation; (3) economic criteria for fishery management plans; and (4) means to control foreign fishing harvests within the U.S. zone. Success of the management effort will depend more upon actions and attitudes of fishery councils and federal authorities than upon any rigid institutional constraints. Maximization of social welfare and economic gains will not necessarily result from such traditional biological goals as maximum sustainable physical yield; instead, consideration is needed of economic values generated by fisheries, private and social costs of fishery exploitation and management, and probable income distribution resulting from regulations. (Lynch-Wisconsin)

PROPERTY RULES, LIABILITY RULES, AND ENVIRONMENTAL ECONOMICS,
Wisconsin Univ.-Madison. Center for Resource Policy Studies.
D. W. Bromley.
Journal of Economic Issues, Vol. 12, No. 1, p 43-60, March 1978. 2 tab, 22 ref.

Descriptors: *Environmental economics, *Economics, *Property rights, *Liability, *Externalities, *Entitlements, Decision making, Model studies, Methodology, Classification, Policy, Theoretical analysis, Rules.

While environmental economics has fully emerged as a subdiscipline of economics, as signalled by works of Baumol and Oates (1975 and Fisher and Peterson (1976), there has been little explicit discussion of the central role of alternative assignments of property rights. Standard policy has been to internalize externalities by changing property rights and thus the scope of decision-making. This paper attempts to fill a theoretical gap with a taxonomy of entitlements (property rights) developed by Calabresi and Melamed (1972), and also suggests several important considerations in externality situations. Human interference is here regarded as multifaceted, and assumptions that transactions costs are low or zero, that only two parties are engaged in bargaining, and that there is a unique damage function are not taken for granted. Calabresi and melamed postulated three basic types of entitlements, adopted here: (1) those protected by property rules, (2) those protected by liability rules, and (3) inalienable entitlements. Five rules of entitlement are summarized in a table. It is shown that under a property rule negotiation and agreement must occur prior to an action, while under a liability rule actions with interfering aspects will occur, and compensation follows the action. In situations involving many individuals, a liability is more practical. A concluding section assesses implications for invironmental policy-making. (Lynch-Wisconsin)

THE NATIONAL WATER COMMISSION REVISITED PERSPECTIVE ON NATIONAL WATER POLICY STUDIES, WITH SOME IMPLICATIONS FOR CHANGES IN FUTURE WATER POLICY,
National Research Council, Washington, DC. Commission on Natural Resources.
T. M. Schad.
Water Resources Bulletin, Vol. 14, No. 2, p 302-312, April 1978. 6 ref.

Descriptors: *National Water Commission, *Water policy, Water conservation, Policy formulation, Government reorganization, Recommendations.

In 1973 the National Water Commission concluded its five-year study of national water policy by issuing a massive report containing over 200 recommendations for improvements in the way the Nation deals with its water resources. The Carter Administration is now engaged in another water policy review which incorporated many of the policies espoused by the National Water Commission. In this paper, which was presented at the 13th American Water Resources Conference in Tucson in November of 1977, the author describes the work of the National Water Commission and the actions taken on its recommendations. WATER ADMINISTRATION IN ENGLAND AND WALES IMPACTS OF REORGANIZATION,
Victoria Univ. (British Columbia). Dept. of Geography.
W. R. D. Sewell, and L. R. Barr.
Water Resources Bulletin, Vol. 14, No. 2, p 337-348, April 1978. 2 fig, 3 tab.

Descriptors: *Water management(Applied), *Administration, *England, *Wales, *Legislation, *Water authorities, Reorganization, Institutions, Policy, Organizational structure, Recruitment patterns.

Water management in England and Wales has undergone a major transformation in the past three decades, and especially under the 1963 and 1973 legislation. It has witnessed a shift from local to national responsibility, an integration of functions, and a move towards the incorporation of economic principles into water policies. For some observers, the new legislation appeared to be pioneering and farsighted. There is little doubt that it has resulted in many beneficial changes. However, not all the goals have been achieved. Modification of the 1973 legislation are already in prospect. Reviewed herein are the progress to date and comments on the problems now to be faced. (Bell-Cornell)

AN ANALYSIS OF CRITICISMS OF INTERNATIONAL FISHERY ORGANIZATIONS WITH REFERENCE TO THREE AGENCIES ASSOCIATED WITH THE CANADIAN WEST COAST FISHERY,
Waterloo Univ. (Ontario). Dept. of Geography.
B. Mitchell, and H. M. Huntley.
Journal of Environmental Management, Vol. 5, No. 1, p 47-73, January 1977. 9 tab, 23 ref.

Descriptors: *Fisheries, *Canada, *Managemen *International agencies, *Criticisms, Literatu review, Research procedure, Fishing industry, E forcement, Regulation, Decision making.

This study purposed to identify weaknesses of i ternational fishery agencies and to explore the implications for management. Based upon a liter ture review, nine common criticisms of intern tional fishery organizations are identified relati to allocation of power, acceptability of recomme dations, enforcement responsibility, regulation non-member nations, flexibility, type of researc staff, generation of data, communication a public involvement. These criticisms are then e amined relative to three international agencies a sociated with the Canadian west coast fishery: t International agencies associated with the Canad an west coast fishery: the International Nor Pacific Fisheries Commission, Internation Pacific Halibut Commission, and Internation Pacific Salmon Commission. These organizatio vary in terms of structure, target species a management problems. Data were collected duri three months in the summer of 1974 by perso interviews. Respondents were selected from va ous groups within the industry. Interviews we completed with respresentatives from the intern tional fishery organizations, national governme fishery departments, provincial government age cies, fishermen, processors, and external exper The findings suggest two types of criticism: consensus exists as to the validity of the criticis but variation emerges as to whether their effec on management have positive or negative impact and (2) it is agreed that the criticisms are releva and that they have a negative effect on manag ment practices. For either category, no simp solutions exist; alternatives are available, ea having its own strong and weak points. (Bell-Co nell)

ECONOMIC IMPACTS OF PULP AND PAPE INDUSTRY COMPLIANCE WITH ENVIRO MENTAL REGULATIONS. VOLUME I. SU MARY AND AGGREGATE INDUSTRY IMPAC ANALYSES.
Little (Arthur D.), Inc., Cambridge, MA.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-268 74 Price codes: A10 in paper copy, A01 in microfich Environmental Protection Agency, Report EP 230/3-76-014-1, 221 p, May 1977. 38 fig, 76 tab.

Descriptors: *Pulp and paper industry, *Econom impact, *Environment, *Protection, Water poll tion control, Air pollution, Economics, Cost Water pollution sources, Legislation, Regulatio Econometrics, Pollution abatement, Prices, D mand, Financing, Foreign trade, Import, Expo Noise, Legal compliance.

This report estimates the potential economic i pacts that would result from the pulp and paper i dustry's compliance with the following existing proposed environmental regulations: water (tho issued by the EPA for existing and new capacity air (those issued by states for the existing indust and those issued by the EPA for new capacity; a noise (those issued by OSHA). The analysis do not include costs or impacts associated with ti berlands or paper/paperboard converting oper tions (except wher converting is done at the pap mill). The impacts of complying with these regul tions on paper prices and demand, short-ter capacity constraints, secondary impacts on su pliers, mill closures, external financing requi ments, and balance of trade (imports/exports) a discussed. Econometric analysis was used to es

e demand and supply curves for the major duct sectors, and the economics of model mills used to assess closures and long-term prices. inancial funds flow model is developed to esti- e cash flow requirements for growth and en- nmental costs. (Witt-IPC)

ERGY CONSERVATION AND OUTDOOR CREATION,
itage Conservation and Recreation Service, shington, DC.
. Bever, and F. P. Dodd.
8 Nationwide Outdoor Recreation Plan, Task ce Report. 24 p, 4 tab, 18 ref.

criptors: *Recreation, *Energy, *Energy con- vation, *Energy consumption, Recreation lities, Transportation, Tourism, Social ects, Scenic highways, Recreation demand, reational vehicles, National parks, Local ks.

How the supply and price of energy affects recreation, and how recreation can conserve energy resources is explained. Recreation involves consumption of energy in a variety of indirect ways, such as maufacture of recreational goods, and maintenance of recreational facilities and associated business, such as gas stations, hotels, and restaurants. A more direct use of energy is the fuel consumption needed to travel to recreational areas and fuel consumed by recreational vehicles. Such consumption is expected to increase steadily at a rate of 3% a year. One suggested method for conserving such energy is development of more efficient automobile engines but this will not aid those who cannot afford to buy a new, more efficient vehicle. An alternative is to encourage use of mass transit facilities where they exist by providing better information on availability, improved scheduling, and more frequent service. Another approach is to develop new recreational areas closer on recreation is discussed, with emphasis on rising gasoline prices and its predicted effect on travel. Although travel to National parks did decline 13% during the 1973-1974 oil crises, it is difficult to project the effect of slow, regular price increases expected over the next 5 to 10 years. Included are a list of areas for further research and a summary of policy questions which will have to be addressed in the near future. (Majtenyi-IPA)

IMPACTS OF IMPOUNDMENT TO VERTEBRATE ANIMALS AND THEIR HABITATS IN THE SNAKE RIVER CANYON, WASHINGTON,
Washington State Univ., Pullman. Dept. of Zoology.
R. E. Lewke, and I. O. Buss.
Northwest Science, Vol. 51, No. 4, p 219-270, 1977, 18 fig, 19 tab, 62 ref. OWRT-A-054-WASH(3).

Descriptors: *Impoundment impacts, Above-pool habitats, Below-pool habitats, Floodplains, Lower Granite area(Wash), Wildlife, *Washington, Environmental effects.

Impoundment by Lower Granite Dam on the Snake River inundated 1,319 ha of wildlife habitat; 210 ha represented tree-shrub riparian habitat and 1,109 ha represented weedy-floodplain habitat. These habitat were of paramount importance to wildlife, particularly in winter. Sixty-five of 129 species studied were significantly dependent upon tree-shrub riparian habitat. Thirty-four species were significantly dependent upon riverbank-floodplain habitat. Birds forced from these habitats by inundation will not be able to re-establish themselves in remaining above-pool habitats which were filled to capacity before impoundment occurred. Furthermore, the loss of below-pool habitats will indirectly cause a decrease in the number of birds remaining in above-pool habitats. The greater a species' dependence on tree-shrub riparian or riverbank-floodplain habitat, the greater the impact of impoundment on that species. Impoundment is estimated to cause a loss locally of nearly 14,000 birds in summer and over 30,000 birds in winter. Migrant birds did not utilize the lower Snake River Canyon habitats to a great degree, and thus will not be affected as much as resident birds. Since vertebrate species will be affected differently by habitat loss, population density will decline disproportionately. Some species will be forced completely from the area. All upland game birds will decrease after impoundment; Ring-necked Pheasants will be reduced the most because of this species' strong dependence upon the floodplain. Although Chukar partridge populations declined 46 percent from 1972 to 1973, this upland game bird will very probably maintain relatively high population densities in future years. The overall impact to vertebrates will be a high loss in numbers and a decrease in diversity. Opportunities for management in the area of Lower Granite Reservoir are very limited. The most productive soils are now inundated, and only shallow rocky soils extend above pool level. These shallow soils will not support high quality riparian and floodplain habitats, thus resulting in a permanently reduced and simplified vertebrate fauna.

WETLANDS AS A NAVAL ENVIRONMENTAL CONCERN,
Naval Academy, Annapolis, MD. Dept. of Political Science.
C. L. Cochran.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 360, Price codes: A02 in paper copy, A01 in microfiche. Report USNA-EPRD-24, Energy-Environment Study Group, U. S. Naval Academy, May, 1975. 14 p.

Descriptors: *Wetlands, *Census, *Military reservations, Data collections, Planning, Environment, Environmental effects.

Currently the Navy lacks basic numbers in terms of wetland acreage, miles of shoreline, much less a complete study of what it owns. It was intended that a data bank would be developed with this information, that could be used for storing and retrieving the data, which would be Navy oriented. Events such as oil spills, noise studies, and other information could be used as a device to identify potential pollution sources or problems for naval installations. (Steiner-Mass)

ON THE ENVIRONMENTAL EFFICIENCY OF ECONOMIC SYSTEMS,
Pennsylvania State Univ., University Park.
R. J. McIntyre, and J. R. Thornton.
Soviet Studies, Vol 30, No 2, p 173-192, April 1978. 1 tab.

Descriptors: Economics, *Environmental effects, *Methodology, *Environmental convergence, *Soviet Union, *United States, *Pollution abatement, Public policy, Political aspects, Central planning, Institutions, Incentives, Air pollution, Water pollution control, Legislation, Regulation, Pollutants, Gross national product, Theoretical analysis.

Evaluation of environmental efforts and policies of the Soviet Union, and comparison with similar data for the United States, demonstrates that environmental convergence theories are inconsistent with evidence and are methodologically incorrect. Such theories hold that environmental disruption will tend to be uniform among countries at similar levels of economic development regardless of national political or institutional form. It is shown that data limitations and methodological difficulties which invalidate these theories also render ambiguous any empirical comparison of the overall environmental performance of two economies. In consequence, comparisons must be restricted to evaluations of the appropriateness of institutional forms and incentive structures which determine environmental performance. It is claimed that a centrally planned economy has built-in informational advantages that should make it more environmentally efficient. Evidence also suggests that Soviet implementation of abatement programs has been substantial, contrary to the implications of convergence theorists. The methodology of environmental convergence theorists is invalid because in appraising a country's environmental record, it fails to distinguish between the amount of environmental disruption in an economy and the environmental efficiency of an economic system. CONCEPTUAL AND STATISTICAL ISSUES IN DEVELOPING ENVIRONMENTAL MEASURES - RECENT U.S. EXPERIENCE,
Bureau of Economic Analysis, Washington, DC.
J. E. Cremeans.
The Review of Income and Wealth, No 2, p 97-115, June 1977. 1 tab.

Descriptors: *United States, *Estimating, *Cost-benefit analysis, *Pollution abatement, *Methodology, *Costs, *Public policy, Benefits, Statistical methods, Economics, Water pollution control, Air pollution, Decision making, Expenditures, Administration, Bureau of Economic Analysis.

Methods used by the Bureau of Economic Analysis (U.S. Department of Commerce) in estimating public and private spending for pollution abatement and control (PAC) are described. In 1972 the federal government began work on this project to assess costs and benefits of pollution abatement and control. Work since the project started in 1972 has been limited to: (1) pollution from harmful foreign substances, and (2) forms of energy discharged in production, distribution, and consumption. Estimates so far have dealt only with pollution costs, but evaluation of benefits of abatement and control also is scheduled. PAC concepts and definitions were designed to be compatible with national income accounts. The following terms are defined: pollution, pollution abatement, direct pollution abatement cost, indirect pollution abatement cost, and indirect benefits. A framework for presenting the data is developed, and expenditures for 1972 and 1973 are given. Total national expenditures for PAC were $19.5 billion in 1972 and $23 billion in 1973. These totals are broken down by air, water, and solid waste pollution. Estimates are also subdivided by administrative components: pollution abatement (personal consumption, business, and government), regulation and monitoring, and research and development. Each component is further subdivided. (Lynch-Wisconsin)

DETERMINATION OF TERRESTRIAL ALBEDO FROM LANDSAT I SATELLITE IMAGERY IN PHOTOGRAPHIC FORM,
Arizona Water Resources Research Center, Tucson.
J. Ben-Asher.
Soil Science Society of America Journal, Vol. 41, p 835-838 1977. 2 fig, 3 tab, 9 ref. OWRT A-069-ARIZ(2), 14-34-0001-6003.

Descriptors: Remote sensing, *Albedo, Arizona, *Sonoita Creek basin(Ariz), *Photography, *Radiometry, Data collections, Soil reflectance, *LANDSAT I imagery.

Satellite imagery taken from LANDSAT I were used to determine terrestrial albedo and its changes with location and season in the basin of Sonoita Creek (31 degrees 45' N 110 degrees 43' W). A simple linear equation was derived to link the albedo with the optical density of the imagery. The modeling approach was based on the cyclic nature of the energy exchange between earth and space on the one hand and on the local density on the developed film as an output on the other hand. The results showed acceptable agreement between photographic and radiometric method for albedo determination.

REMOTE WATER MONITORING SYSTEM,
National Aeronautics and Space Administration, Washington, DC. (Assignee).
D. C. Grana, and D. P. Haynes.
U.S. Patent No. 4,089,209, 10 p, 5 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 970, No 3, p 844, May 16, 1978.

Descriptors: *Patents, *Monitoring, *Sampling, Data collections, *Remote sensing, Floating, Data transmission, Electrochemical analysis.

A remote water monitoring system is described that integrates the functions of sampling, sample preservation, sample analysis, data transmission and remote operation. The system employs a floating buoy carrying an antenna connected by lines to one or more sampling units containing several sample chambers. Receipt of a command signal actuates a solenoid to open an intake valve outward from the sampling unit and communicates the water sample to an identifiable sample chamber. Such response to each signal receipt is repeated until all sample chambers are filled in a sample unit. Each sample taken is analyzed by an electrochemical sensor for a specific property and the data obtained is transmitted to a remote sending and receiving station. Thereafter, the samples remain isolated in the sample chambers unitl the sampling unit is recovered and the samples removed for further laboratory analysis. (Sinha-OEIS)

NONMETALLIC ELECTROFISHING BOOMS AND ACCESSORY TACKLE,
Fish and Wildlife Service, Arkadelphia, AR.
T. O. Duncan.
The Progressive Fish Culturist, 1978, Vol. 40(3), p 98-100. 1 tab, 3 fig, 6 ref.

Descriptors: On-site investigations, Laboratory equipment, *Zooplankton, Methodology, *Trawling, *Sampling, *Freshwater fish, Fish attractants, Fishing gear, *Electrofishing, Fish populations, Non-metallic electrofishing booms.

The original strength and flexibility of nonmetallic (nonconducting) electrofishing booms were maintained by building special tackle from which to hang the electrodes and to suspend the boom above the water. The booms and tackle functioned well in field operations, and since the booms are nonconducting, they reduce the potential hazard associated with electrofishing equipment. Epoxy resin poles filled with polyurethane foam were used instead of dimensional lumber, wooden dowels, hollow fiber glass poles, or aluminum tubing wrapped in fiber glass. (EIS-Katz)

HAILSTONE SIZE INFERRED FROM DENTS IN COLD-ROLLED ALUMINUM SHEET,
Council for Scientific and Industrial Research, Pretoria (South Africa). National Physical Research Lab.
D. V. D. S. Roos.
Journal of Applied Meteorology, Vol. 17, No. 8, p 1234-1239, August 1978. 7 fig, 2 tab, 7 ref.

Descriptors: *Hail, *Measurement, *Particle size, Analytical techniques, Aluminum, Precipitation(Atmospheric), Weather, Cloud physics, Storms, Mathematical studies, Meteorology, Hailstones, Hailstones size.

The reflecting properties of microscopic corrugations on the surface of cold-rolled aluminum sheet used in hailpads led to a new technique for determining the size of hailstones. Hailstone models of various shapes and sizes were used to produce dents in the sheet, for normal and oblique impacts. It was found that psi, the diameter (or equivalent spherical diameter) of hailstones, was related to mean d, the diameter of the characteristic shadow inside dents, such that psi = 0.6 mean d + 3 (for psi between 4 and 40 mm). The standard deviation of psi (for normal impacts) was found to be + or - 8% for spheres of psi = 6 mm, + or - 5% for spheres of psi greater than 11 mm and between approximately + or - 6 and + or - 17% for nonspherical objects. Also, the value of mean d for nonspherical objects that impacted at angles of up to 50 deg was only about 10% larger than the corresponding value of mean d if the impact had been normal. An estimate of the kinetic energy of an impacting hailstone may be made from d. This method proved to be particularly suitable for recording actual hailfalls, and results thus obtained are discussed. (Sims-ISWS)

THE VERTICAL PLANAR MOTION MECHANISM; A DYNAMIC TEST APPARATUS FOR EVALUATING CURRENT METERS AND OTHER MARINE INSTRUMENTATION,
National Ocean Survey, Rockville, MD.
A. N. Kalvaitis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 571, Price codes: A03 in paper copy, A01 in microfiche. Report No EPA-600/7-78-145, July 1978. 37 p, 7 fig, 2 tab, 4 append. EAP-78-BEA.

Descriptors: *Flow measurement, *Flowmeters, *Hydraulic design, *Hydraulic models, Fluid mechanics, Dynamics, Currents, Vertical Planar Motion Mechanism(VPMM), Flow, Dynamics, Hydraulic machinery, Instrumentation.

To aid in evaluating accuracy of current meters and other marine instruments, a dynamic test apparatus called a Vertical Planar Motion Mechanism (VPMM) was developed which is capable of generating three major modes, vertical-circular, vertical, and horizontal. Length scales range from 0.15 to 1.22 m and time scales vary from 5 to 12 seconds. The VPMM is mounted on a tow carriage which provides the steady velocity while the apparatus itself superimposes oscillatory motions on full-size current meters. The VPMM is instrumented so that the instantaneous velocities of the test sensors and their outputs may be measured at a 20-Hz sampling rate, and an on-board computer allows for near-real time data analysis. The development and wet acceptance testing of the VPMM is described using several types of current sensors, including electromagnetic and acoustic varieties. Performance of the apparatus was judged acceptable for all conditions investigated and no deleterious interactions were noted between it and the test instruments. The VPMM provides a unique capability for testing and evaluating sensors at various combinations of length and time scale dynamics. Other anticipated uses for the VPMM include testing wave measurement systems, validating dynamic response models, and conducting stability tests on towed vehicles. (Majtenyi-IPA)

AGRICULTURAL AND HYDROLOGICAL APPLICATIONS OF RADAR: FINAL REPORT,
Kansas Univ. Space Technology Center, Lawrence. Remote Sensing Lab.
F. T. Ulaby.
Available from the National Technical Information Service, Springfield, VA 22161 as N77-12243, Price codes: A05 in paper copy, A01 in microfiche. Technical Report 177-62, July 31, 1976. 90 p, 2 append. NASA NAS9-10261.

Descriptors: *Remote sensing, *Radar, *Bibliographies, Data processing, Application methods, Equipment, Instrumentation, Geology, Agriculture, Forestry, Hydrology, Soils, Soil types, Soil moisture, Snow, Oceanography, Abstracts, Publications, Documentation.

This was the final report of the research performed under NASA contract NAS 9-10261 covering the period 15 August 1969 to 31 July 1976. During the initial disciplines and activities in radar remote sensing, including radar systems development and analysis, data processing and display, and data interpretation in geology, geography, and oceanography. Between 1972 and the termination date of the contract, the research was focused on the evaluation of radar remote sensing applications in hydrology and agriculture based on data acquired with the Microwave Active Spectrometer (MAS) system. Due to the large volume of information generated under this contract, the titles of the reports summarizing the work were grouped by subjects. Radar remote sensing was divided into three major areas of activity: (1) Radar System Studies, (2) Data Processing and Display, and (3) Geoscience Applications. Each area was subdivided on the basis of specialization within that area. Appendix A contained abstracts of all 62 technical reports generated under this contract. Appendix B contained a sequential list of the titles of these reports. (Sims-ISWS)

SIMPLE SAMPLER ACTIVATION AND RECORDING SYSTEM,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
F. A. Koehler, F. J. Humenik, E. P. Harris, and J. C. Barker.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 104, No. EE5, Technical Note, p 1032-1035, October 1978. 3 fig, 1 ref, 1 append. EPA R803328.

Descriptors: *Water sampling, *Instrumentation, *Automation, *Control systems, Sampling, Streamflow, Hydrology, Hydrographs, Automatic control, Research equipment, Water measurement, Sampling activation, Recording systems.

A simple sampler activating device that resulted in automated sample procurement and simultaneous hydrograph time-stage notation was developed as part of a project to assess the impact of rural nonpoint sources on an areawide basis. The total instrumentation for continuous gaging and automated sampling was battery operated because sampling sites were in rural areas. The sampler selected (ISCO Model 1392, Instrumentation Specialities Company, Lincoln, Nebraska) may be activated on a time or flow basis, and the actual sampling interval can be a multiple (up to 12) of the primary interval. A continuous analog state record was obtained using a Freiz Model AU stage recorder. Results of 18 months of field use have been favorable. Significant improvements that have accrued from the use of this system as opposed to time interval sampling are: (1) samples are taken in response to hydrologic changes in the stream, when greatest changes in stream chemistry are expected; (2) repetitive samples under steady-state flow conditions are eliminated, reducing the analytical laboratory workload; (3) streamflow and water chemistry are measured concurrently, allowing more precise calculation of constituent transport; (4) no prior knowledge or assumptions of the hydrologic response time of the stream is necessary in order to adequately characterize a runoff event; and (5) all streamflow regimes are sampled, small and large runoff events as well as baseflow recession, in proportion to the expected changes in water chemistry. MAPS SHOWING WATER-LEVEL DECLINES, LAND SUBSIDENCE, AND EARTH FISSURES IN SOUTH-CENTRAL ARIZONA,
Geological Survey, Tucson, AZ. Water Resources Div.; and Bureau of Reclamation, Phoenix, AZ. Arizona Dept. of Transportation, Phoenix.
R. L. Laney, R. H. Raymond, and C. C. Winikka.
Water-Resources Investigations 78-83 (open-file report), June 1978. 2 sheets, 20 ref.

Descriptors: *Groundwater, *Overdraft, *Water level fluctuations, *Land subsidence, *Fissures(Geologic), Maps, Aquifers, Water wells, Pumping, Drawdown, Land use, Water demand, Urbanization, Evaluation, *Arizona, Pinal County, Maricopa County.

From 1915 to 1975, more than 109 million acre-feet of ground water was withdrawn from about 4,500 square miles in Pinal and Maricopa Counties in south-central Arizona. The volume of water withdrawn greatly exceeds the volume of natural recharge, and water levels have been declining since 1923. As a result of the water-level declines, the land surface has subsided, the alluvial deposits have been subjected to stress, and earth fissures have developed. Land subsidence and earth fissures have damaged public and private properties. Subsidence and fissures will continue to occur as long as ground water is being mined and water levels continue to decline. As urban development expands, land subsidence and earth fissures will have an increasing socioeconomic impact. Information on maps includes change in water levels, measurements of land subsidence, and location of earth fissures. A section showing land subsidenc between Casa Grande and the Picacho Peak I terchange also is included. Scale 1:250,00 (Woodard-USGS)

GROUNDWATER QUALITY ATLAS O NEBRASKA,
Geological Survey, Lincoln, NE. Water Resourc Div.; and Nebraska Univ. Conservation and Su vey Division, Lincoln.
R. A. Engberg, and R. F. Spalding.
Nebraska Conservation and Survey Divisio University of Nebraska: Resource Atlas No. 1978. 39 p, 20 fig, 1 tab, 32 ref.

Descriptors: *Water quality, *Groundwate *Nebraska, *Maps, *Chemical analysis, Samplin Sites, Aquifer management, Geochemistr Chemical reactions, Water analysis, Dissolv solids, Alkalinity, Hardness(Water), Sodiu Potassium, Sulfates, Chlorides, Fluorides, Boro Silica, Iron, Manganese, Phosphorus, Nitrate Trace elements, Selenium.

This atlas contains a series of maps describing t chemical quality of the ground water of Nebrask Each map depicts the quality of water in only t principal aquifer in each area of the State; no tempt was made to differentiate water from d ferent geologic sources. Maps showing zones concentration of 13 chemical constituent or co binations of constituents are presented along wi accompanying maps of sampling sites. The 13 co stituents are dissolved solids, hardness as CaCO sodium plus potassium, alkalinity as CaCO sulfate, chloride, fluoride, silica, boron, iro manganese, selenium, and phosphorus. A m showing constituent sampling-site maps presented for the trace constituents arsenic, ca mium, chromium (hexavalent), copper, lea silver, and zinc. Another map shows nitrate sa pling sites and two areas where ground water co tains high-nitrate concentrations. Descripti matter concerning source and occurrence of ea constituent is included on pages facing the respe tive maps. Short descriptions of each of 13 u derground-water areas also are given. (Woodar USGS)

GROUND-WATER DATA, 1974-76, INDIA WELLS VALLEY, KERN, INYO, AND SA BERNARDINO COUNTIES, CALIFORNIA,
Geological Survey, Menlo Park, CA. Wat Resources Div.
C. E. Lamb, and D. J. Downing.
Open-file report 78-335, July 1978. 42 p, 3 fig, plate, 3 tab, 5 ref.

Descriptors: *Groundwater resources, *Wat wells, *Pumping, *Water yield, *Water leve Water quality, Data collections, Water level flu tuations, California, *Indian Wells Valley, *Ke County, *Inyo County, *San Bernardino County

Water-level measurements were made annually 115 wells in Indian Wells Valley, Kern, Inyo, a San Bernardino Counties, Calif., in 1974-76. In t Inyokern area the average water-level decline w 2.0 ft for two wells between October 1973 a November 1976. In the intermediate area t average decline was 6.2 ft for five wells betwe October 1973 and December 1976. In t Ridgecrest area the average decline was 4.5 ft f four wells between October 1973 and Decemb 1976 but was 10.3 ft for one well during the sa period. Reported metered ground-water pumpa from Indian Wells Valley totaled 14,400 acre-ft 1974, 14,500 acre-ft in 1975, and 14,100 acre-ft 1976. These figures may not completely reflect t total pumpage from the basin due to changing p terns of land use and new pumping source Chemical analyses were made of 102 water sa ples collected from 42 wells during 1974-76. T analyses show large variance of quality of grou water in Indian Wells Valley. (Woodard-USGS)

ER RESOURCES DATA FOR PENNSYL-IA, WATER YEAR 1977--VOLUME 2. QUEHANNA AND POTOMAC RIVER INS.
ogical Survey, Harrisburg, PA. Water urces Div.
lable from the National Technical Informa-Service, Springfield, VA 22161 as PB-285 754, codes: A17 in paper copy, A01 in microfiche. r-Data Report PA-77-2, June 1978. 384 p, 7 tab.

riptors: *Pennsylvania, *Hydrologic data, face waters, *Groundwater, *Water quality, g stations, Streamflow, Flow rates, Sedi-transport, Water analysis, Water tempera-Chemical analysis, Lakes, Reservoirs, Water , Water levels, Data collections, Sites, quehanna River basin, *Potomac River basin.

r resources data for the 1977 water year for sylvania consist of records of stage, arge, and water quality of streams; stage, nts, and water quality of lakes and reser-and water levels and water quality of ground . This report, volume 2 (Susquehanna and nac River basins), contains discharge records 6 gaging stations; stage and contents for 10 lakes and reservoirs; water quality for 36 gaging stations, 8 partial-record stations, and water levels for 32 observation wells. Also included are 24 crest-stage partial-record stations and 48 low-flow partial-record stations. Additional water data were collected at various sites, not involved in the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Pennsylvania. (Woodard-USGS)

WATER RESOURCES DATA FOR WISCONSIN, WATER YEAR 1977.
Geological Survey, Madison, WI. Water Resources Div.
Water-Data Report WI-77-1, May 1978. 626 p, 13 fig.

Descriptors: *Wisconsin, *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water-resources data for the 1977 water year for Wisconsin include records of streamflow at gaging stations, partial-record stations, and miscellaneous sites; records of reservoir storage, records of chemical, physical and biological characteristics of surface water, ground water, and precipitation, and records of water levels in observation wells. Records for a few gaging stations in bordering States also are included. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Wisconsin. (Woodard-USGS)
W79-00267

WATER RESOURCES DATA FOR PENNSYLVANIA, WATER YEAR 1977--VOLUME 3. OHIO RIVER AND ST. LAWRENCE RIVER BASINS.
Geological Survey, Harrisburg, PA. Water Resources Div.
Water-Data Report PA-77-3, June 1978. 272 p, 6 fig.

Descriptors: *Pennsylvania, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Ohio River basin, *St. Lawrence River basin.

Water resources data for the 1977 water year for Pennsylvania consist of records of stage, discharge and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of ground water. This report, volume 3 (Ohio River and St. Lawrence River basins), for 96 gaging stations; stage and contents for 22 lakes and reservoirs; water quality for 13 gaging stations and water levels for 20 observation wells. Also included are 12 crest-stage partial-record stations and 27 low-flow partial-record stations. Additional water data were collected at various sites, not involved in the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Pennsylvania. (Woodard-USGS)

POTENTIOMETRIC SURFACE MAP OF THE FLORIDAN AQUIFER IN THE ST. JOHNS RIVER WATER MANAGEMENT DISTRICT AND VICINITY, FLORIDA, SEPTEMBER, 1977,
Geological Survey, Orlando, FL. Water Resources Div.
F. A. Watkins, C. P. Laughlin, and E. C. Hayes.
Water-Resources Investigations 78-69 (open-file report), 1978. 1 sheet.

Descriptors: *Groundwater, *Potentiometric level, *Wet seasons, *Maps, *Hydrogeology, Aquifers, Florida, *St. Johns River Water Management.

This map presents the potentiometric surface of the Floridan aquifer in the St. Johns River Water Management District and vicinity for September 1977. The Floridan aquifer is the principal source of potable water in the area. Water-level measurements were made on approximately 900 wells and springs. The potentiometric surface is shown by 5-foot contours except in the Fernandina Beach area where 10- and 20-foot contours are used to show the deep cone of depression. This is the first map covering the entire St. Johns River Water Management District and vicinity for September, a high water-level period. The potentiometric surface ranged from 130 feet above mean sea level in Polk County to 131 feet below sea level in Nassau County. (Woodard-USGS)
W79-00275

SPECIES DIVERSITY INDICES OF THE FISH POPULATIONS OF STREAMS DRAINING SELECTED TEST AREAS ON EGLIN AIR FORCE BASE RESERVATION FLORIDA,
Air Force Armament Lab., Eglin AFB., FL.
R. C. Crews.

Available from the National Technical Information Service, Springfield, VA 22161 as ADA-035 592, Price codes: A03 in paper copy, A01 in microfiche. Report AFATL-TR-76-145, 50 p, December 1976. 25 fig, 2 tab, 6 ref, append.

Descriptors: *Darters, *Streams, Fish populations, Freshwater fish, Habitats, Aquatic environment, Aquatic populations, Statistical methods, Mathematic studies, On-site collections, Water pollution effects, *Diversity, *Species diversity, *Species diversity indices, Endangered species.

A baseline study of fishes was conducted in streams draining various test ranges currently used for testing and evaluation of conventional munitions. The purpose of the effort was to determine a species diversity index for each of the streams to be used for comparison data in future studies and for use in environmental documentation. Twenty-three species of fishes and one lamprey species were collected or observed. All specimens were preserved and catalogued for placement in the Air Force Armament Laboratory's fish reference collection. Many streams sampled serve as the habitat for an endangered species, the Okaloosa darter. One hundred and fifteen specimens of the Okaloosa darter were observed and released unharmed. (EIS-Deal)

COMPUTING TWO-DIMENSIONAL DAM-BREAK FLOOD WAVES,
California Univ., Davis. Dept. of Land, Air and Water Resources.
N. Katopodes, and T. Strelkoff.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY9, p 1269-1288, September 1978. 8 fig, 14 ref, 2 append.

Descriptors: *Dam failure, *Flood waves, *Mathematical models, *Unsteady flow, *Algorithms, Reservoirs, Hydraulics, Dams, Computers, Model studies, *Method of characteristics, Wave propagation, Inundation, Wave fronts.

A mathematical model of two-dimensional unsteady flow through a breached dam was developed. The numerical method of characteristics in three independent variables was used to construct an algorithm correct to second order with respect to time. The solution progresses at specified time intervals. At any time, the flow conditions are obtained by extending characteristic conoids back to a previously computed time plane and allowing information to propagate along the curvilinear rays of these conoids. Both the negative wave propagating into the reservoir and the jet emerging from the breach and eventually inundating the valley downstream of the dam were modeled in detail. Arbitrary dam geometry and channel topography can be taken into account. Propagation of the wave fronts was simulated by a computational grid moving with time. The exact computed resuls of the model were presented graphically as axonometric projects for the depth and as plan-view, two-dimensional vector fields for the flow velocities. (Singh-ISWS)
W79-00313

A MATHEMATICAL MODEL FOR SIMULATING WATER DEMAND-SUPPLY AND ENERGY USES FOR THE STATE OF PENNSYLVANIA,
Pennsylvania State Univ., University Park.
H. H. Martinez.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 154, Price codes: A07 in paper copy, A01 in microfiche. Master of Science thesis, March, 1978. 122 p, 10 fig, 32 tab, 22 ref, append. OWRT A-048-PA(2), 14-34-0001-7080.

Descriptors: *Energy, *Water resources, *Water policy, Pennsylvania, Planning, *Linear flow model, *Energy policy, *Energy crisis, *Water/energy demand, *Water/energy system, *Water/energy policy, Socio-economic development, Supply-demand, Energy production model.

The high level of socio-economic development of society has been accompanied by high increments in water/energy demand. Since the recent energy crisis and the realization that there are severe limitations on raw energy and water resources, there has been a change in the thrust of water/energy policy toward the development of new domestic energy sources and better use controls for water resources. A linear Flow Model, as a mathematical tool, can be used to simulate different situations of water/energy supply-demand response to energy demand changes in order to make easier the planning and control of energy production in some optimal mode. Preliminary models of water supply-demand in Pennsylvania were established using Linear Flow Model methodology and use of these models to depict the operation of the Pennsylvania water/energy system was illustrated. The models will also be used to explore water/energy policy alternatives through impact studies. (Sink-Penna)

WATER WELL DEVELOPMENT DECISIONS,
Texas A and I Univ., Kingsville. Dept. of Civil and Mechanical Engineering.
M. M. Truitt.
Public Works, Vol. 109, No. 8, p 83, August, 1978. 1 fig, 3 ref.

Descriptors: *Well development, *Gravel packs, *Well screens, *Well design, Specifications, Water wells, Design criteria.

Three important decisions in water well design and construction are: (1) Is a gravel pack needed; (2) If so, what size gradation should be specified; and (3) what size well screen is proper. A gravel pack is needed if the effective size or tenth percent of the water bearing sand is less than 0.01 inch. The gravel pack must have voids small enough to keep sand from passing through the well screen into the well yet have sufficiently permeability. The mea grain size of the gravel pack should be 4 or 5 tim the mean grain size of the formation (water sand and the uniformity coefficient or the ratio of th sixtieth percantile to the tenth percantile should b between 2.0 and 2.5. The slot size of the scre should retain between 85 and 100 percent of th filter material. (Purdin-NWWA)

REGIONAL GEOLOGY SERIES: PART VI THE COLORADO PLATEAU,
National Water Well Association, Worthingto OH.
H. W. Heiss.
Water Well Journal, Vol. 32, No. 10, p 53-64. 1 fi

Descriptors: *Groundwater, *Regional analys *Water wells, *Drilling, *Colorado Platea Geology, Climates, Aquifers, Water yield, Wat quality, Southwest U.S.

The Colorado Plateaus region is comprised of i dividual plateaus of faulted, deeply-eroded sed mentary rocks. Climate is arid to semiarid sin precipitation varies with topography. Altitud with sufficient precipitation are too cold for ra ing crops, and irrigation is necessary in warm areas. Ground water reservoirs are mostly san stone and limestone but a few wells top alluv sand deposits and basalt. Many wells must drilled through several hundred feet of unsat rated rock due to drainage of ground water in canyons and low permeability of sandstone. Gallup, New Mexico, domestic and municip wells 200-1000 ft. deep are drilled with cable-to rigs into sandstone at rates averaging 120-350 deep into sandstone which yield 25 to 40 gpm water containing moderate iron. In Camp Verd Arizona, domestic wells are drilled 60 to 300 fe through alluvium and cavernous limestor Boulder fields and caving sands are two problem encountered in this area. Acid ground water c curs in nearby Corville, Arizona. In Flagsta Arizona, large industrial wells 400 to 500 ft de yield at least 1000 gpm, and some yield 3500 gp of good quality water. (Purdin-NWWA)

NEW APPROACH GETS RESULTS IN UTA WELL,
Indian Health Service, Phoenix, AZ. Office of E vironmental Health.
R. E. Hatten.
Johnson Drillers Journal, Vol. 50, No. 4, p 5 July-August, 1978. 2 fig.

Descriptors: *Groundwater, *Water supp development, *Water wells, Infiltration galleri Caissons, Well screens, Well filters, Utah.

In an area near the borders of Arizona, New Me ico, and Utah most domestic water requirements obtained from ground water. A chronic problem

area is loss of production due to clogging of screens by sand and silt. To overcome this lem, the U. S. Public Health Service and the ajo Engineering and Construction Authority gned a radically different well. An 8-foot wide 6-foot long caisson was constructed and two ction galleries were dug from the caisson to a by river. A non-woven fabric, designed for an e-ground septic tank leach field, was used as ter medium for the collection galleries. En- ce velocity was reduced from one-tenth to less one-hundredth of a foot per second. A 6-inch well screen was selected and a 10-20 gravel used. The well produced 1000 gpm for 72 s, at which time drawdown had stabilized. indicated that the well would satisfy the com- ity's needs for at least the next 20 years. din-NWWA)

pen channel flow is usually three-dimen- l, consisting of the primary and secondary s. The primary flow was defined herein as the component in the longitudinal direction of the nel, while the secondary flow includes the ining flow components in the vertical and verse directions of the channel. In an alluvial nel, the channel cross sections and, thus, the -dimensional flow structure vary irregularly ndomly along the flow. A technique was loped and presented herein that can be used mpute secondary currents and, thus, the ir- ar three-dimensional structure of open chan- flow. The technique uses analytical, odynamic equations along with measured data annel geometry and primary flow velocity bution. Illustrative examples were presented results of practical applications of the nique, describing the variability of the tion and magnitude of secondary currents time, space, and discharge rate. ERICAL STUDY OF CONTINUOUS SAL- ION,
South Wales Univ., Kensington (Australia).
ol of Mechanical and Industrial Engineering.
Reizes.
al of the Hydraulics Division, American ty of Civil Engineers, Vol. 104, No. HY9, edings Paper 14030, p 1305-1321, September 12 fig, 15 ref.

riptors: *Bed load, *Saltation, *Numerical sis, Hydraulics, Hydrodynamics, Particle , Particle size, Sedimentation, Flow, Reynolds number, Mathematical studies, *Particle trajectories, Solids flow.

Continuous saltation is understood to occur when a particle in a horizontally flowing fluid rebounds repeatedly from the bed of a flume without being deposited. The motion of an isolated spherical particle near a bed of similar particles in an orderly horizontal array was simulated numerically. A three-dimensional model based on coefficients of restitution and friction was developed for the bed interaction with the moving particle. It was shown that the upward component of the drag force on a downward moving particle can be greater than the net gravitational force on that particle. For different values of the relative particle density, the results for average height of bounce, average particle horizontal velocity, and rate of solids transport cannot be reduced to a single well-ordered family of curves when the Shields entrainment function and the particle Reynolds number are used as independent parameters. The results can be correlated if these parameters are each multiplied by a factor containing the relative particle density. (Lee-ISWS)

AIR ENTRAINMENT IN RADIAL FLOW TOWARDS INTAKES,
Government Coll. of Engineering and Technology, Raipur (India). Dept. of Civil Engineering.
A. K. Jain, K. G. R. Raju, and R. J. Garde.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY9, Proceedings Paper 14038, p 1323-1329, September 1978. 3 fig, 3 ref.

Descriptors: *Air entrainment, *Intakes, *Flow, Intake structures, Froude number, Hydraulics, Hydraulic structures, Reservoirs, Viscosity, Water circulation, *Radial flows, Vertical pipe intakes.

The aim of this paper was to understand clearly the role of the different parameters on vortex formation. A study was made where the vanes for circulation are radial and thus the approach flow is free from circulation. Air entrainment in radial flow at intakes occurs when the submergence is greatly reduced, and the flow is of the gulping type with the liquid surface above the intake pulsating. It was shown by experimentation that the critical submergence is practically independent of the viscosity, as well as the surface tension of the liquid. In radial approach flow towards vertical pipe intakes, the safe submergence to prevent air entrainment always must be greater than the value predicted by the proposed equation for ranges of the Froude number between 1.1 and 20. PRESSURE FLUCTUATIONS BENEATH SUBMERGED JUMP,
University of Manchester Inst. of Science and Technology (England). Dept of Civil and Structural Engineering.
R. Narayanan.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY9, Proceedings Paper 14039, p 1331-1342, September 1978. 9 fig, 1 tab, 12 ref, 2 append.

Descriptors: *Hydraulic jump, *Submergence, *Flumes, *Pressure, *Fluctuations, Hydralics, Jets, Laboratory tests, Froude number, Non-uniform flow, Viscosity, Velocity, Stability, *Submerged jump, *Pressure fluctuations, Efflux depth, Unstable disturbances.

Wall pressure fluctuations were measured beneath a hydraulic jump that was completely submerged. Two effiux velocities, 3.3 m per s and 2.6 m per s, were used; the corresponding Froude numbers were 9.8 and 7.7, respectively. For a distance of 42 times the efflux depth, the intensity of the fluctuations si 4 to 7 times that beneath a turbulent boundary layer. It declines only slowly with downstream distance. Inertial scaling brings together the spectra for the velocities at higher frequencies. Evidence was presented for the contribution of the fluctuations due to the unsteadiness of the mass of water in which the jet spreads. The inviscid instability of the submerged hydraulic jump was investigated. There was agreement between the dominant frequency of pressure fluctuations beneath the submerged hydraulic jump and the frequency of the most unstable disturbances predicted by the theory. SEVEN PROBLEMS IN BUBBLE AND JET DROP RESEARCHERS,
State Univ. of New York at Albany. Atmospheric Sciences Research Center.
D. C. Blanchard, and L. D. Syzdek.
Limnology and Oceanography, Vol. 23, No. 3, p 389-400, May 1978. 2 fig, 1 tab, 30 ref.

Descriptors: *Air-water interfaces, *Bubbles, *Drops(Fluids), Laboratory tests, Analytical techniques, Bacteria, Jets, Equipment, Methodology, Physics, Water properties, Physical properties, Limnology, Oceanography, Laboratory techniques, Bubbles bursting, Jet drops.

Four of the problems deal with the mechanics of bubble production and bursting, and the collection and sizing of jet drops:; three concern the transfer of the bacterium Serratia marcescens from bursting bubbles to jet drops. The problem of producing bubbles of a specified size from glass capillary tips is overcome by paying careful attention to tip geometry. Problems associated with bubble bursting have not been solved, but it is believed that they are caused by small differences in the position of the bubble relative to the interface at the time of bursting. The collection and sizing of jet drops can cause problems, but suggestions were given to overcome them. Of the three problems involving bacteria, only the last appears to have a satisfactory solution. Experiments showed that the concentration of bacteria is always highest in the top jet drop of the jet and decreases progressively in the lower drops, being lowest in the bottom drop. This is in qualitative agreement with the hypothesis of jet drop formation advanced by MacIntyre. (Sims-ISWS)

EDDY PRODUCTION INSIDE WALL LAYERS,
Universidad Nacional Autonoma de Mexico, Mexico City. Dept. of Ingeniera.
E. Levi.
Journal of Hydraulic Research, Vol. 16, No. 2, p 107-122, 1978. 10 fig, 41 ref.

Descriptors: *Boundary layers, *Eddies, *Vortices, *Viscous flow, *Shear drag, Fluid mechanics, Flow, Reynolds, Turbulence, Water circulation, Wals, *Wake trails, Wall layers, Drag-reducing flows, Streamwise eddies.

Turbulent eddies created inside wall region are assumed to be wake trails shed by low-speed fluid tongues ejected out of viscous sublayer. The assumption is corroborated by experimental evidences. As a result, it was shown that there are 3 kinds of those eddies: streamwise eddies, undulated eddies, and annular eddies. Their properties were described. An application of those concepts to a comparison between the behavior of Newtonian and drag-reducing flows shows the usefulness of the proposed model for a deterministic approach to the forecasting of the structure of turbulent flows. MOMENTUM TRANSFER IN A COMPOUND CHANNEL,
Ulster Coll. Northern Ireland Polytechnic, Jordanstown.
W. R. C. Myers.
Journal of Hydraulic Research, Vol. 16, No. 2, p 139-150, 1978. 10 fig, 2 tab, 9 ref.

Descriptors: *Momentum, *Flood plains, *Natural streams, *Boundary processes, Flumes, Model studies, Hydraulics, Shear stress, Vortices, Channels, *Compound channel, Flood wall, Interacting condition.

A Preston tube was used to measure shear stress distributions around the periphery of a complex channel, consisting of a deep section and one flood plain. Measurements were made with full cross section flow and with flow confined to the deep, or channel, section. The results were used to quantify the momentum transfer due to interaction between the channel flow and that over its flood plain, demonstrating the danger of neglecting this phenomenon in complex channel analysis. Lateral momentum transfer throughout the channel and flood plain was compared under isolated and interacting conditions. (Singh-ISWS)

HYDRAULIC MODEL INVESTIGATION OF A TWO-WAY DROP INLET FOR FLOODWATER RETARDING STRUCTURE NO. 3, BANKLICK CREEK WATERSHED, BOONE AND KENTON COUNTIES, KENTUCKY,
Department of Agriculture, Minneapolis, MN. Science and Education Administration.
C. L. Anderson.
Report No. ARS-NC-63, August 1978. 24 p, 17 fig, 6 tab, 2 ref.

Descriptors: *Hydraulic models, *Laboratory tests, *Spillways, *Hydraulic structures, *Kentucky, Reservoirs, Flow control, Model studies, Discharge(Water), Pressure conduits, Measurement, Hydraulics, Data collections, Pressure, Performance, Spillway crests, Methodology, Weirs, Testing, Flow, Flow characteristics, *Banklick Creek(Ky), Drop inlet spillways.

This report described hydraulic model studies of a two-way drop inlet closed conduit spillway for a floodwater retarding structure. The proposed structure was unique. Although the crest of the drop inlet was 4 pipe diameters (4D) long, and the drop inlet was 2D long, requiring a contraction section between the crest section and the drop inlet shaft. The purposes of the model study were (1) to observe the performance, and (2) to determine the flow and pressure coefficients of the drop inlet. This report described the proposed prototype structure, and it presented the results of tests on the original design and several modifications of the spillway. The flow into the drop inlet was disturbed by the contraction between the 4D-long weir crests and the 2D-long drop inlet. The jets from the sloping endwalls in the contraction intersected the nappes falling from the crest. However, these disturbances did not noticeably affect the performance of the structure. The longitudinal splitter wall prevented lateral sloshing of the boil supported on the nappes as the weirs became submerged. When the longitudinal wall was removed, sloshing of the nappes occurred. STOCHASTIC PROCESSES IN WATER RESOURCES ENGINEERING.
Lund Inst. of Tech. (Sweden). Dept. of Water Resources Engineering.
Proceedings, Second International IAHR Symposium on Stochastic Hydraulics, Lund Institute of Technology/University of Lund, Sweden, August 1976. Water Resources Publications, Fort Collins, Colorado, 1977. 552 p, 184 fig, 59 tab, 328 ref. Gottschalk, L., Lindh, G., and de Mare, L., Eds.

Descriptors: *Stochastic processes, Water resources, *Engineering, *Simulation analysis, *Hydraulics, *Risk analysis, *Analytical techniques, Hydrology, Rivers, Reservoirs, Design, Mathematical models, Equations, Systems analysis.

Stochastic methods have long been applied to problems in certain fields of hydraulics, i.e., turbulence, sediment transport, and wave analysis. The First International Symposium on Stochastic Hydraulics was held in Pittsburg in 1971, showing a trend towards more sophisticated stochastic methods and their application to new areas of hydraulics. This trend becomes even more pronounced at the Second International Symposium held in Lund in 1976. Papers here show a wide spectrum of hydraulic problems approached by stochastic methods and the introduction of new statistical concepts such as Kalman-filtering and entropy. This Proceedings has been published in two separate books: (1) Stochastic Processes in Water Resources Engineering, and (2) Hydraulic Problems Solved by Stochastic Methods. The former is divided into 3 sections: analysis and simulation of stochastic hydraulic processes; risk analysis and water resources systems. Dealt with are such subjects as sediment storage modeling for reservoirs, the interpretation of surge wave attenuation by the Passage Theory; discounted flood risks in least-cost design of storm sewer networks; uncertainties on roughness for pipe design; stochastic models applied to reservoirs near the Alps; and a stochastic optimization model of the Lech River system. This book contains 25 of the 53 papers presented, representing authors from 17 countries. Detailed analytical techniques are applied throughout to solve a wide variety of problems in stochastic water resources engineering, including estimation theory, simulation analysis, dynamic programming, and trade-off analysis. Available from the National Technical Information Service, Springfield, VA 22161 as AD-A044 074, Price codes: A04 in paper copy, A01 in microfiche. Technical Paper No. 77-8, July 1977. 69 p, 32 fig, 8 tab, 15 ref.

Descriptors: *Inlets(Waterways), *Seiches, *Bays, *Great Lakes, *Hydraulics, Lakes, Velocity, Hydrographs, Continuity equation, Numerical analysis, *Inlet-harbor resonance, Inlet hydraulics, Reversing velocities.

A simple numerical model was developed to predict inlet velocities, discharge, and bay levels for Great Lakes inlets. The model was applied to several inlets. Examples were given using the model for typical design computations. Numerical modeling of selected inlets showed that head, temporal acceleration of inertia, convective acceleration, and friction may all be important in controlling the hydraulics of these inlets. Temporal acceleration may be specially important as it causes bay fluctuations to be amplified and out of phase with the forcing wave. Even a small-amplitude seiche may generate significant reversing inlet velocities if the wave period is near the inlet-bay Helmholtz period. Reversing velocities at most inlets are generally small. However, the velocities may be high if the inlet is located where the lake seiche amplitudes are relatively large and have a period approximately equal to the inlet-bay system Helmholtz period. VORTEX FORMATION AT VERTICAL PIPE INTAKES,
Government Coll. of Engineering and Technology, Raipur (India). Dept. of Civil Engineering.
A. K. Jain, K. G. Ranga Raju, and R. J. Garde.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY10, Proceedings Paper 14104, p 1429-1445, October 1978. 11 fig, 14 ref, 2 append.

Descriptors: *Entrainment, *Intakes, *Model studies, Dimensional analysis, Hydraulic models, Pipe flow, Vortices, Submergence, Pipes, Air entrainment, Froude number, Similarities, Circular vortex tanks, Guide vanes.

With the object of determining the similarity criterion, experimental studies on vortex formation at pipe intakes were carried out using two geometrically similar circular vortex tanks; circulation in approach flow was generated by means of adjustable guide vanes. Transparent pipe intakes of different sizes and liquids of different viscositites and surface tensions were used in a recirculating system. Based on the analysis of data, a method was proposed, according to which a geometrically similar model is operated at the same Froude number as in the prototype; and the observed critical submergence is corrected for distortion due to change in the model Reynolds number. A criterion to determine the type of vortex for known geometric and kinematic conditions also was proposed. (Lee-ISWS)

INTERNAL FRONTS IN TWO-LAYER FLO,
Technische Hogeschool, Delft (Netherlands). Dept. of Civil Engineering; and Technische Hogeschool, Delft (Netherlands). Lab. of Fluid Mechanics.
C. Kranenburg.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY10, Technical Note, p 1449-1453, October 1978. 5 fig, 8 ref, 1 append.

Descriptors: *Density currents, *Internal waves, *Theoretical analysis, *Flow, Analytical techniques, Mathematical studies, Fluid mechanics, Waves(Water), Equations, Underflow, Hydrodynamics, Shape, Profiles, Two-layer flow.

The intrusion of a fluid layer into a heavier or lighter fluid has received considerable attention in literature. Two extreme cases regarding the ratio between the depths of the intruding layer and the continuous layer have been examined, i.e., the flow of a relatively thin layer in deep water and exchange flow. Exchange flow arises when a vertical barrier separating two fluid layers of approximately equal depths and slightly different densities is removed. A notable progress in the theoretical description of fronts of intruding layers (or density currents) is due to Benjamin who showed that hydrodynamical energy will be conserved only if the depth of the advancing layer equals half the total depth H. If h is less than (1/2)H a loss of energy must occur in the continuous layer. Depths of the advancing layer greater than half the total depth would require a gain of energy, which is physically unrealistic. On the basis of energy considerations, it can be concluded that for real fronts h is equal to or less than (1/2)H. The technical note showed that a more restrictive condition for the existence of fronts than that given by this equation results from an analysis of the stability of a front in relation to internal wave disturbances. HOUSING PROJECT TO UTILIZE GROUND WATER.
Water Well Journal, Vol. 32, No. 10, p 58-59. 1 fig.

Descriptors: *Heat pumps, *Solar energy, *Heating, *Cooling, Water utilization, Energy conservation, Groundwater.

A residential development near Dayton, Ohio will be heated and cooled by a solar energy/water source heat pump system. During the heating cycle radiant energy from the sun is transferred to water stored in an underground tank. During the summer, heat is extracted from interior spaces and dissipated to the ground water by using an underground closed loop as a heat exchanger. Initial cost for the system include: a solar water heater; a special grate to absorb fireplace heat; a microprocessor which automatically selects the most economical form of heating and cooling; a clothes dryer; and a kitchen range. Electric power for the units will be supplied by a bioconversion plant, where methane gas from human waste will be used to run a turbine generator. This system is predicted to work in 90 percent of the United States. (Purdin-NWWA)

WELL POINT SYSTEMS.
Drilling News, Vol. 3, No. 2, p 12, Winter, 1978. 1 fig.

Descriptors: *Well points, *Pumps, Aquifers, Drawdown, Shallow wells, Water wells.

A well-point system is a series of shallow boreholes connected to a central pump to obtain large quantities of water economically. Three conditions are necessary for a well-point system: (1) the water table must be within a few meters of the land surface; (2) a good aquifer must be found at depths of 6-15 m; and (3) the wells themselves must be highly efficient. Locating the wells on the circumference of a circle gives the system greatest hydraulic efficiency. The maximum drawdown at which the wells can be operated is the difference between the suction head of the pump and the static water level. A pump that has good suction characteristics should be selected. All piping connections on the suction side of the pump must be absolutely air tight and the well screen must be set before the suction limit of the pump. Where this is not possible due to a thin aquifer, the pumping rate must be reduced. An alternative to this is the use of a drop tube inside the well screen which will permit the pumping level to drop below the top of the screen. (Purdin-NWWA)

STABILIZATION OF EARTH SUBSURFACE LAYERS,
Woodbine Corp., Fort Worth, TX. (Assignee).
G. Cain, J. D. Teague, and P. J. Wright.
U.S. Patent No. 4,084,381, 8 p, 2 fig, 1 tab, 8 ref; Official Gazette of the United States Patent Office, Vol 969, No. 3, p 835, April 18, 1978.

Descriptors: *Patents, *Soil stability, *Subsurface flow, Soil water movement, Soil strength, Groundwater movement, Stabilization, Fly ash, Lime.

A method of treating subsurface layers of the earth is provided to perform one of controlling movement of subsurface water and building strength of the subsurface layers. It is characterized by injecting at predetermined depth and at predetermined, spaced-apart locations a lime-fly ash slurry consisting essentially of water, particulate hydrated lime, particulate fly ash and surfactant. In the preferred embodiment, the paritculate lime and fly ash are present as particulate solids in a proportion within a range of 25-60% by weight of the water. The particulate solids comprise lime in a proportion of 25-50% by weight and fly ash in a proportion of 75-50% by weight. The invention relates to improving the subgrade for buildings, road beds, or the like. (OEIS-Sinha)

DEFLECTION OF P.V.C. PIPE UNDER BURIAL CONDITIONS,
Ontario Ministry of the Environment, Toronto.
M. B. Fielding.
Report No. R. P. S2045, May 1978. 16 p, 10 tab, 6 ref.

Descriptors: *Soil physical properties, *Piping systems, *Polyvinyl chloride, *Soil mechanics, Soil modulus, Passive resistivity, Spangler formula.

In designing flexible piping systems used for underground, nonpressurized flow, the resistance of the pipe to deflection is a function of both the stiffness of the pipe material and the lateral support provided by the surrounding soil. One type of plastic used for such piping is made of polyvinyl chloride (PVC). The design formula for flexible pipelines, first stated in 1941 by Spangler, took this concept into account and has become an accepted method of flexible conduit design. However, difficulties in obtaining values for some parameters, such as soil modulus of passive resistivity, has led to attempts to develop alternatives to the Spangler formula. Nevertheless, the modified Spangler approach remains theoretically sound and, with appropriate modifications, can achieve excellent results. One additional refinement is described: to incorporate measurable values of pipe stiffness isn place of 'EI' in the formula delta x = D.K.Wc. cu r/EI + 0.016E' cu r. THe soil modulus is essentially an unmeasurable quantity and is usually determined experimentally by measuring pipe deflection under a known load and calculating the value of E' which would limit deflection to the measured value. In this paper, the values used for E' were collected from several reference sources and are tabulated for several representative soil types. Sample computations are included and the resuls for maximum long term deflection of nine types of PVC pipe are tabulated for class I and II gravel, sand, clay, and peat. (Majtenyi-IPA)

USING ICE AS WATER-IMPERMEABLE ELEMENT IN ROCKFILL DAMS,
N. A. Tsytovich, V. A. Vesilov, and N. V. Styrova.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A047 539, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 661, November 1977. 8 p, 2 fig, 3 ref. Translated from Trudy Koordinatsionnykh Soveschanii Po Gidrotekhnike, Vol. 10, p 132-136, 1964.

Descriptors: *Rockfill dams, *Cold weather construction, *Model studies, Mathematical models, Ice, Freezing, Thawing, Permeability, Cold regions, Earth dams, Dams, Structures, Hydraulic structures, Temperature, Heat transfer, Ice cores.

At the present time, rockfill dams are used extensively in the Soviet Union and abroad. It is known that the antifiltration elements in them are cores or screens made of water-impermeable materials. After analyzing planning materials and experience in construction of structures under harsh climatic conditions, constructing rockfill dams with ice cores in areas where permafrost soil occurs was suggested in 1961. The natural conditions in the proposed construction regions are characterized by harsh and prolonged winters, with a considerable thickness of permafrost, which is a positive factor for construction and operation of these dams. The principal difficulty in building such a dam under conditions where permafrost soils occur involves the changes in the temperature regime of the body of the dam and its foundation over the course of time. A method was developed to calculate the nonstationary temperature field of a frozen rockfill dam and a foundation under any given boundary conditions, determined by the natural data of the region. As a result of the studies, it was found that the version of the rockfill dam with an ice core can have sufficient thermal and statistical stability. These studies are continuing, but the results already obtained indicate that such a dam is competitive with other structural varieties. (Sims-ISWS)

ALLOWING FOR THE WATER PERMEABILITY OF FROZEN GROUND SCREENS DURING THEIR FORMATION,
A. I. Pekhovich.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 899, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 591, February 1977. 8 p, 4 fig, 5 ref. Translated from Izvestiya Vsesoyuznogo Nancho-Issledovatel'skogo Instituta Gidrotekhniki imeni B.Ye. Vedeneyev, Vol. 54, p 208-213, 1955.

Descriptors: *Cofferdams, *Frozen ground, *Permeability, Cold regions, Cold weather construction, Dams, Freezing, Infiltration, Model studies, Mathematical models, Structures, Hydraulic structures, Soil water, Soil water movement, Soil science, Earth dams.

Creation of water-impermeable cofferdams is an important and sometimes extremely complex problem which builders, in particular those who construct hydraulic facilities, are frequently called upon to solve. One of the most widely used methods of constructing water-impermeable dams is the method of artificially freezing ground. Artificially freezing ground, consists of the following: Freezing columns are implanted in the dam with a certain distance between them. Brine is circulated in the columns and is cooled by a refrigeration device. Initially, individual frozen ground cylinders are formed around each column, and these cylinders then join into a single water-impermeable mass. It is obvious that between the beginning of freezing and the complete interconnection of the frozen ground cylinders, the rate of the filtration flow through the cofferdam changes. The question of how large the filtration flow is during this period is not only of theoretical but also of considerable practical interest--for instance in determining the value of the heat flow from the nonfrozen ground to the frozen ground cylinders (in calculating the freezing speed), in determining the possible value of the filtration flow rate through the cofferdam when the frozen ground cylinders do not join completely (the problems of drainage from the excavation), etc. Unfortunately, no appropriate calculation method has yet been devised. This article was designed to fill this gap. (Sims-ISWS)

Journal of the Engineering Mechanics Division, American Socity of Civil Engineers, Vol. 104, No. EM5, Proceedings Paper 14058, p 1099-1111, October 1978. 3 fig, 3 tab, 17 ref, 2 append.

Descriptors: *Dams, *Seepage, *Model studies, *Mathematical models, Earth dams, Equations, Mathematics, Flow, Groundwater movement, Drainage, Computer models. Analytical techniques, Civil engineering, Variance analysis, Dam underseepage, Inequalities.

The flow problem of seepage through a homogeneous dam on an impervious foundation with a toe drain was solved numerically using the Baiocchi method. The numerical scheme reduces to an algorithm that is computationally efficient, accurate, and fast, and requires only a fraction of the preprocessing effort time that the other numerical algorithms do. The results compared well with other numerical and analytical results. The problem also was reduced to a variational inequality that was shown to have at most one solution from which it follows that the original problem has at most one solution. (Sims-ISWS)

LOW TOXIC CORROSION INHIBITORS FOR ALUMINUM IN FRESH WATER,
National Aeronautics and Space Administration Huntsville, AL. George C. Marshall Space Fligh Center.
T. S. Humphries.
Available from the National Technical Informa tion Service, Springfield, VA 22161 as N7828226 Price codes: A02 in paper copy, A01 in microfiche Report No. NASA TP-1279, July 1978. 16 p, 3 tab.

Descriptors: *Corrosion control, *Aluminum *Chemical reaction, Sodium chromate, Borates Nitrates, Phosphates, Silicates, Sodium mercap tobenzothiazole, Hydrogen ion concentration Water injury, Inhibitors, Inorganic compounds Nitrites, Sodium compounds.

The effectiveness of using combinations of chemi cals to inhibit the corrosive action of water on alu minum was evaluated. Since use of chromate in hibitors was restricted, there is a need for new low toxicity inhibitors. Combinations of several in organic chemicals, such as borates, nitrates nitrites, phosphates, and silicates, as well as sodi um mercaptobenzothiazole were evaluated at vari ous concentrations and conditions, including tem perature and pH. Combinations were use because, individually, these compounds are onl partially effective as inhibitors of corrosion. Of 5 mixtures tested, 8 showed excellent corrosion in hibition on 2219-T87 aluminum compared to sodium chromate standard. (Majtenyi-IPA)

WATER ANALYTICAL DATA AS A TOOL IN DRILLING AND PRODUCTION ECONOMICS,
W. C. Martin.
Journal of Petroleum Technology, Vol. 30, No. 9 p 1342-1346, September, 1978. 4 tab.

Descriptors: *Water analysis, *Water chemistry *Oil reservoirs, *Drilling, *Water sources, Wate pollution, Injection, Compatibility, Corrosion Scaling, Water sampling.

A detailed summary is provided of the applicatio of water analytical data in drilling and producin oil and gas. Basic requirements for sampling an analysis of water are tabulated. It is important t examine each constituent and its relationship t other constituents in determining the origin of an water. Various sources of water are: casing leaks injection breakthrough; connate water; acid treat ment water; drilling brine; produced water; irriga tion water; sewage effluent; and other wast water. The compatibility of two or more water must be determined before they are combined Several common incompatible combinations ar listed. The potential corrosiveness of any wate must be evaluated. Hydrogen sulfide, carbon diox ide, oxygen, pH, temperature and undersaturatio are the principle parameters. The presence o aerobic bacteria and coloration of the water in dicates air contamination which may aggravat corrosion. It is possible to predict whether a wate will deposit scale. Four common scaling com ponents: calcium carbonate, calcium sulfate, bari um sulfate, and strontium sulfate are discussed Water analytical data such as filterable solids abrasives, suspended oil, and bacteria are useful i injection water studies. NDWATER PUMPING TECHNIQUES
XCAVATIONS AND OTHER WORKS,
Cashman.
g News, Vol. 3, No. 2, p 7-11, Winter, 1978.

ptors: *Dewatering, *Excavation,
ment(Structural), Well-points, Bored-filter
Freezing, Electro-osmosis, Aquifers,
, Soil mechanics, Artificial recharge.

d-water control during excavation can be
ed by pumping or forming an impermeable
. What technique should be used depends
type and strata of soil, foundation specifica-
nd groundwater encountered. The most
nly used methods of groundwater lowering
nventional sump pumping, well-pointing,
red filter wells. Lowering of the phreatic
increases the effective load on the soil and
use settlement, especially in a confined
. In some cases it may be necessary to em-
round water recharge to reduce potential
ent. Freezing and electro-osmosis form an
neable barrier under appropriate conditions.
ng can be used in all types of saturated soils
s. Liquid nitrogen provides a faster rate of
than brine. Electro-osmosis can be used in
very soft cohesive soils to reduce moisture
and increase shear strength. (Purdin-
A)
0185

IONS AND PROPERTIES OF DRILLING

News, Vol. 3, No. 3, p 6-12, Spring 1978.

tors: *Drilling fluids, *Colloids, *Wells,
, Rotary drilling, Technology(Wells), His-

story of the development of drilling mud
ogy is summarized. Various functions of
mud are discussed, such as: cooling the bit;
ng cuttings from the hole; preventing cav-
ntrolling of gas, oil, or water pressure in the
on penetrated; lubricating drill pipe, wall of
e, casing, slush pumps and bit bearings;
g corrosion; holding all solids in suspen-
the portion of the drilling mud in the hole,
arly during interruptions in drilling;
ing all sand and cuttings in the ditch or set-
; and facilitating the movement of drill pipe
ing. The ability of a drilling mud to fulfill all
ve functions, except those involving unit
is largely due to the concentration of col-
aterial in the mud. Other characteristics of
fluids that aid in performance of functions
edom from grit or abrasive particles; high
or unit weight; correct pH; and low con-
ons of salt and other electrolytes. A drilling
ust not deposit a thick filter cake on the
the hole nor allow a high volume of filtrate
e the formation. (Purdin-NWWA)

STAMINA TUNNEL TESTS ON HATCHERY-REARED ATLANTIC SALMON,
Maine Cooperative Fishery Research Unit, Orono.
J. D. McNeish, and R. W. Hatch.
The Progressive Fish Culturist, 1978, Vol. 40(3), July 1978, p 116-117. 1 tab, 5 ref.

Descriptors: *Atlantic salmon, *Methodology, Laboratory tests, Laboratory equipment, *Fish physiology, *Fish diets, Aquaculture, Fish hatcheries, Maine, Juvenile fish, *Hatchery-reared Atlantic salmon, *Fish stamina, Stamina tunnel tests.

Authors describe a stamina tunnel for evaluating the stamina of hatchery-reared Atlantic salmon and to evaluate the effects on stamina of different diets and different fish establishments. They conclude that variables other than those to be tested were present and the apparatus could not be used. (EIS-Katz)
W79-00075

REARING OF CHINOOK SALMON IN TRIBUTARIES OF THE SOUTH FORK SALMON RIVER, IDAHO,
Intermountain Forest and Range Experiment Station, Ogden, UT.
W. S. Platts, and F. E. Partridge.
Department of Agriculture, Forest Service, Research Paper INT-205, 15 p, May, 1978. 3 fig, 12 ref, 4 tab.

Descriptors: *Chinook salmon, *Habitats, *Idaho, Fisheries, Stream fisheries, Fish management, Tributaries, Salmon, Aquatic habitats, Cutthroat trout, Aquatic animals, Aquatic life, Fish, Salmon River(Idaho), Trout.

Fish populations in 23 tributaries of the South Fork Salmon River (Idaho) were samples in 1971, 1972, and 1974. Juvenile chinook salmon were found in one secondary and 11 primary tributaries. The first 400 m reach of stream adjacent to the river was the most important area for rearing and supported 58% of the total tributary chinook salmon population. Only three tributaries had chinook salmon more than 1.6 km from the river. The tributary chinook salmon standing crop ranged from 0.01 to 0.38/sq m and averaged 0.06/sq m for all streams. Cutthroat trout and chinook salmon were not found together. Chinook salmon preferred the larger lower gradient, grassy-banked streams having deep pools. (Witt-IPC) al trophic balance. (Sinha-OEIS)

ATMOSPHERIC WATER-VAPOR RESOURCES FOR RAINFALL AS THEY ARE RELATED TO WATER SYNTHESIS IN PLANT LIFE, ANNOTATED BIBLIOGRAPHY.
Manuscript, Los Angeles, CA, August 1978, 46 p, Compiled by Michael Aron Weinberg.

Descriptors: *Bibliographies, *Rainfall, *Water vapor, *Atmosphere, *Plant physiology, Water balance, Water resources.

This bibliography contains 359 annotated entries, listed in chronological order, pertaining to atmospheric water vapor resources for rainfall and their relationship with water synthesis in plant life. Scientific and other periodicals, books, and plays are included, and each entry is coded as to subject, such as climate, chemistry, fiction, plants and plant physiology, and weather and meteorology. In addition, there is a list of authors by year giving keyword subjects, and an alphabetical list of authors. (Majtenyi-IPA)

SUMMARIES OF PHYSICAL RESEARCH IN THE GEOSCIENCES.
Department of Energy, Washington, DC. Div. of Basic Energy Sciences.
Report No. DOE/ER-0016, September 1978. 52 p.

Descriptors: *Geophysics, *Geothermal studies, *Remote sensing, Projects, *Department of Energy research, Aeronomy, Seismology, Geology, Hydrology, Geochemistry, Petrology, Energy, Meteorology, Sediments, Brines, Kinetics, Aqueous solutions.

Research supported by the Department of Energy is aimed at providing basic knowledge in the fields of earth, atmospheric, and solar/terrestrial sciences. This series of summaries prepared by the investigators describes work performed during 1977, the scope of work to be done in 1978, and some information on research planned for 1979. Included under the heading of on-site geosciences are programs on geoscience, remote sensing, aeronomy, geothermal energy, thermodynamics of silicates, seismology, magma energy research, and physical chemistry of geothermal solutions. Under the heading off-site geoscience, are such areas of research as seismology, meteorology, magnetic field annihilation process in the magnetosphere, isotopic studies of rare gases in terrestrial samples, and organic geochemistry of outer continental margin and deep ocean sediments. Among the programs related to water research are projects on geothermal energy, thermodynamics of high temperature brines, and kinetics and transport of aqueous solutions. (Majtenyi-IPA)

BACTERIA
Biocenosis of a High Mountain Stream Under the Influence of Tourism. 2. Bacteria as an Index of Water Pollution on the Rybi Potok Stream,
W79-00219 5C

Microbial Degradation of DDT,
W79-00278 5C

Control of Nuisance Odors from Ponds by the Use of Bacteria Cultures,
W79-00374 5D

Influence of Methodological Factors on Plate Counting of Aquatic Bacteria: I. Statistical Analysis of the Incidence of Time Lasting from Sample collection Up to Commencement of Counting, (In Spanish),
W79-00385 5A

Denitrifying Bacteria Can be Enumerated in Nitrite Broth,
W79-00498 2G

BANKLICK CREEK (KY)
Hydraulic Model Investigation of a Two-Way Drop Inlet for Floodwater Retarding Structure No. 3, Banklick Creek Watershed, Boone and Kenton Counties, Kentucky,
W79-00341 8B

BARIUM
Geologic Studies to Identify the Source for High Levels of Radium and Barium in Illinois Ground-Water Supplies: A Preliminary Report,
W79-00003 5A

BARK
Collecting Bark Burner Ash with Electrostatic Precipitators,
W79-00163 5D

BARROW STRAIT
Icebreaking Capability of CCGS 'Labrador' in Western Barrow Strait, October 23-28, 1973,
W79-00090 2C

BASE FLOW
Influence of Strip Mines on Regional Ground-Water Flow,
W79-00118 5G

BASEFLOW
Factors Controlling Variations in River Water Quality in Kansas,
W79-00006 5B

BASINS
Simulation of Flows in Ungaged Basins,
W79-00331 2E

BATHYMETRY
Bathymetry as an Indicator of Net Circulation in Well Mixed Estuaries,
W79-00488 2L

BAY OF BOURGNEUF (FR)
First Ecological Data on the Oyster Ponds in the Bay of Bourgneuf (In French),
W79-00295 2L

BAY OF FUNDY (CANADA)
Bedforms and Their Hydraulic Stability Relationships in a Tidal Environment, Bay of Fundy, Canada,
W79-00336 2L

BAYS
Hydraulics of Great Lakes Inlets,
W79-00469 8B

BED LOAD
Mechanical Characteristics of Debris Flow,
W79-00117 2J

Scour of Bed Material in Very Rough Channels,
W79-00122 2J

Measurements of Bed Load in Oscillatory Flow,
W79-00141 2J

BED LOAD

Numerical Study of Continuous Saltation,
W79-00314 8B

BEDS

Bedforms and Their Hydraulic Stability Relationships in a Tidal Environment, Bay of Fundy, Canada,
W79-00336 2L

BEDS UNDER WATER

Bedforms and Their Hydraulic Stability Relationships in a Tidal Environment, Bay of Fundy, Canada,
W79-00336 2L

BEHAVIOR

A Water Quality Model for the South Platte River Basin, Documentation Report,
W79-00398 5B

BELLMAN'S PRINCIPLE

Dynamic Programming and the Principle of Optimality: A Systematic Approach,
W79-00396 6A

BENTHIC FAUNA

Diversity and Environments of Benthic Invertebrate Communities in South Swedish Streams,
W79-00209 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 4. The Bottom Fauna of the Stream Rybi Potok (The High Tatra Mts),
W79-00221 5C

BENTHIC FLORA

Benthic Algae in a Pond After the Accumulation of Beet-Sugar Factory Wastes,
W79-00216 5C

BENTHOS

Artificial Substrate Sampler for Benthic Invertebrates in Ponds, Small Lakes, and Reservoirs,
W79-00074 7B

BIBLIOGRAPHIES

Atmospheric Water-Vapor Resources for Rainfall as They are Related to Water Synthesis in Plant Life, Annotated Bibliography.
W79-00106 10C

Asbestos - A Bibliography,
W79-00225 5A

Summary of U.S. Geological Survey Investigations and Hydrologic Conditions in the Southwest Florida Water Management District for 1977,
W79-00272 4A

PCB in Water, A Bibliography, Volume 3.
W79-00305 5A

Ozone in Water and Waste Water Treatment, A Bibliography, Volume 2.
W79-00306 5D

Irrigation Efficiency, A Bibliography, Volume 3.
W79-00307 3F

Agricultural and Hydrological Applications of Radar: Final Report,
W79-00464 7B

BIGHEAD

Nutrition and Growth of the Bighead Aristichthys Nobilis (Rich.) In Bodies of Water of the Dagestan ASSR,
W79-00320 2H

BIOACCUMULATION

Criteria Document for DDT.
W79-00276 5A

Criteria Document for Toxaphene.
W79-00281 5A

Criteria Documents for Aldrin/Dieldrin.
W79-00282 5A

A First Order Mass Balance Model for the Sources Distribution and Fate of PCBs in the Environment,
W79-00289 5B

Multimedia Levels--Mercury,
W79-00291 5B

BIOASSAY

Development of a Manometric Fish Bioassay Technique for Water Pollution,
W79-00008 5A

Continuous Standard Water Delivery System for Bioassays with Aquatic Organisms,
W79-00073 5A

Bioassay Results of Kraft Mill Effluent at Artificially Elevated Levels of Biosolids,
W79-00406 5C

Musculium Transversum in the Illinois River and an Acute Potassium Bioassay Method for the Species,
W79-00443 5C

BIOASSAY TECHNIQUES

Development of a Manometric Fish Bioassay Technique for Water Pollution,
W79-00008 5A

A Comparative In Vitro Study of the Effects of Various Balanced Saline Solutions on Respiration Rates of Liver Tissues of Three Fish Species,
W79-00454 5C

BIOASSAYS

Simple Venturi Device for Mixing Freshwater and Seawater in an Estuarine Culture System,
W79-00071 7B

BIOCHEMICAL OXYGEN DEMAND

Investigation of Factors Affecting BOD Measurement and Experience with the 1-Day BOD Test,
W79-00405 5A

BIOCIDES

Toxicity of Sodium Pentachlorophenate (NA-PCP) to the Grass Shrimp, Palaemonetes Pugio, at Different Stages of the Molt Cycle,
W79-00078 5C

BIOCONTROL

Control of Aquatic Weed by Moth Larvae,
W79-00197 4A

BIODEGRADATION

Uptake and FAte of DI-2-Ethylhexyl Phthalate in Aquatic Organisms and in a Model Ecosystem,
W79-00061 5B

BIOINDICATORS

Nitrate Reductase Activity of Soybeans in Relation to other Indicators of Water Stress,
W79-00149 2I

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 2. Bacteria as an Index of Water Pollution on the Rybi Potok Stream,
W79-00219 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 3. Attached Algae Communities in the Stream Rybi Potok (The High Tatra Mts, Poland) Polluted with Domestic Sewage,
W79-00220 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 4. The Bottom Fauna of the Stream Rybi Potok (The High Tatra Mts),
W79-00221 5C

The Phosphagens of Some Protozoa as Ecological Indicators (In French),
W79-00423 5A

BIOLOGICAL COMMUNITIES

Studies on the Pathways and Effects of Cadmium in Controlled Ecosystem Enclosures,
W79-00066 5B

Forms of Trace Elements in Soils, Sediments, and Associated Waters: An Overview of Their Determination and Biological Availability,
W79-00271 5B

BIOLOGICAL TREATMENT

Oxygen Activated Sludge Considerations for Industrial Applications,
W79-00354 5D

Control of Nuisance Odors from Ponds by the Use of Bacteria Cultures,
W79-00374 5D

Process Design Investigations for Alaska Pulp Mill Wastewater Treatment Facilities,
W79-00412 5D

BIOMAGNIFICATION

Uptake and FAte of DI-2-Ethylhexyl Phthalate in Aquatic Organisms and in a Model Ecosystem,
W79-00061 5B

BIOMASS

Growth, Mortality, and Biomass Partitioning in Freshwater Tidal Wetland Populations of Wild Rice (Zizania Aquatica Var. Aquatica),
W79-00214 5C

BIOTA

Forms of Trace Elements in Soils, Sediments, and Associated Waters: An Overview of Their Determination and Biological Availability,
W79-00271 5B

BLACKFOOT RIVER (IDAHO)

Hydrochemical Influences on the Fishery Within the Phosphate Mining Area of Eastern Idaho,
W79-00427 5C

BLEACHING WASTES

Textile Waste Waters: Treatment and Environmental Effects,
W79-00166 3E

Process for Purifying Aqueous Industrial Effluents.
W79-00399 5D

Biologically Active Substances in Pulping Waste Liquors. I. Substances Active Against Termites, Coptotermes Formosanus Shiraki, in Kraft Pulping and Bleaching Wastes,
W79-00404 5D

On the Removal of Lignosulfonates and Carbohydrates from Sulfite Pulp Wash Waters with Activated Carbon (Zur Entfernung von

Ligninsulfonaten und Kohlenhydraten aus Sulfitzellstoff-Waschwaessern mittels Aktivkohle),
W79-00410 5D

Characterization of Spent Bleaching Liquors. Part 1. Ultrafiltration of Effluents from Conventional and Oxygen Bleaching Sequences,
W79-00419 5D

BOG
The Productivity of a Range of Blanket Bog Vegetation Types in the Northern Pennines,
W79-00202 2I

BOILERS
Water Treatment: Iron, Boiler Water and Water Analysis.
W79-00176 5F

BORES
Mechanical Characteristics of Debris Flow,
W79-00117 2J

BOSTON (MA)
The Demand for Clean Water: The Case of the Charles River,
W79-00234 6B

BOTTOM SEDIMENTS
Laboratory Study of the Release of Pesticide and PCB Materials to the Wate Column During Dredging and Disposal Operations,
W79-00286 5A

BOULDERS
Origin and Transport of Large Boulders in Mountain Streams,
W79-00490 2J

BOUNDARY LAYERS
Eddy Production Inside Wall Layers,
W79-00333 8B

BOUNDARY PROCESSES
Momentum Transfer in a Compound Channel,
W79-00334 8B

BRACKISH WATE
Development of Low Cost Membrane Cleaning Agents,
W79-00304 3A

BRACKISH WATER
Increased Product Water Recovery by Reverse Osmosis Using Interstage Ion Exchange Softing and a Spiractor,
W79-00301 3A

BRINE SHIRMP
A Procaryotic Intracellular Symbiont of the Great Salt Lake Brine Shrimp Artemia Salina (L.),
W79-00298 2H

BRITISH COLUMBIA
Regional Response to Forcing in Southern Strait of Georgia,
W79-00324 2L

Mass Balance Model for Calculation of Ionic Input Loads in Atmospheric Fallout and Discharge from a Mountainous Basin,
W79-00332 5B

BROOK TROUT
Acute and Chronic Oral Toxicity of Chlroinated Dibenzofurans to Salmonid Fishes,
W79-00062 5C

Genetic and Environmental Factors Involved in Increased Resistance of Brook Trout to Sulfuric Acid Solutions and Mine Acid Polluted Waters,
W79-00458 5C

BROWN TROUT
Growth and Diets of Trout from Contrasting Environments in a Geothermally Heated Stream: The Firehole River of Yellowstone National Park,
W79-00082 5C

BRUSHLANDS
Brushland Watershed Fire Management Policy in Southern California: Biosocial Considerations,
W79-00449 6B

BUBBLES
Seven Problems in Bubble and Jet Drop Researchers,
W79-00319 8B

BUTADIENE
Biological Effects and Environmental Aspects of 1,3-Butadiene,
W79-00292 5C

CADDIS-FLY
Effect of Environmental Factors on the Distribution of Caddis Fly Larvae in Small Rivers (In Russian),
W79-00147 2I

CADMIUM
The Source of American Falls Reservoir Pollutants,
W79-00004 5B

Studies on the Pathways and Effects of Cadmium in Controlled Ecosystem Enclosures,
W79-00066 5B

Adsorption of Some Toxic Substances by Waste Components,
W79-00152 5B

CALCAREOUS SOILS
Water and Physical Properties of the Sod-Calcareous Soils of the Crimean Foothills (In Russian),
W79-00269 2G

CALCRETE
Hydrogeochemistry of a Calcrete-Containing Aquifer Near Lake Way, Western Australia,
W79-00323 2F

CALIFORNIA (SOUTHERN)
Brushland Watershed Fire Management Policy in Southern California: Biosocial Considerations,
W79-00449 6B

CAMBODIA
Hydrogeologic Reconnaissance of the Mekong Delta in South Vietnam and Cambodia,
W79-00255 7C

CAMBRIDGE BAY (N W T)
Mixing in an Arctic Fjord,
W79-00487 2L

CANADA
Regional Response to Forcing in Southern Strait of Georgia,
W79-00324 2L

Mass Balance Model for Calculation of Ionic Input Loads in Atmospheric Fallout and Discharge from a Mountainous Basin,
W79-00332 5B

Bedforms and Their Hydraulic Stability Relationships in a Tidal Environment, Bay of Fundy, Canada,
W79-00336 2L

An Analysis of Criticisms of International Fishery Organizations with Reference to Three Agencies Associated with the Canadian West Coast Fishery,
W79-00394 6E

Hydrogeology of the Grande Prairie Area, Alberta,
W79-00470 2F

Mixing in an Arctic Fjord,
W79-00487 2L

CAPILLARY WATER CAPACITY
Relationships Among Some Physical Properties of Soil (In Slovenian),
W79-00451 2G

CAPTAN
Toxicity of the Fungicide Captan to the Dungeness Crab Cancer Magister,
W79-00065 5C

CARBON DIOXIDE
pH Control Systems Using Carbon Dioxide,
W79-00365 5D

CARBON RADIOISOTOPES
Photosynthesis and Carbon Metabolism in Marine and Freshwater Diatoms,
W79-00208 5C

CARCINOGENESIS
Is Chrysotile Asbestos Released from Asbestos-Cement Pipe into Drinking Water.,
W79-00013 5A

Determination of Chrysotile Asbestos in Rainwater,
W79-00014 5A

CARCINOGENS
Criteria Document for DDT.
W79-00276 5A

Criteria Documents for Aldrin/Dieldrin.
W79-00282 5A

Preliminary Study of Selected Potential Environmental Contaminants - Optical Brighteners, Methyl Chloroform, Tri-Chloroethylene, Tetrachloroethylene and ion Exchange Resins,
W79-00283 5A

CARDIOVASCULAR MORTALITY
Water Hardness and Cardiovascular Mortality,
W79-00171 5C

CARP
Survival and Oxygen Consumption of Young Kura Carp Under Various Keeping Conditions (In Russian),
W79-00180 2H

CATION EXCHANGE
Studies of Ion Exchange and Chelation Compounds Adsorbed on Granular Graphite,
W79-00431 5D

CATIONS
Evaluation of Donnan Dialysis for the Enrichment of Cations,
W79-00434 5A

CATTAILS
Cattails (Typha Spp.)--Weed Problem or Potential Crop.,
W79-00198 2I

CENSUS
Wetlands as a Naval Environmental Concern,
W79-00201 6G

CENTRAL AFRICAN PLATEAU
A Storm Rainfal Pattern Above the Central African Plateau,
W79-00126 2B

CHANNELIZATION
Transport Characteristics of Phosphorus in Channelized and Meandering Streams,
W79-00391 5B

CHARLES (MA)
The Demand for Clean Water: The Case of tne Charles River,
W79-00234 6B

CHELATION
Employing Methylene Phosphonates of Oxyalkylated Polyalkylene Polyamines in Chelation and/or Scale Inhibition,
W79-00052 5F

Studies of Ion Exchange and Chelation Compounds Adsorbed on Granular Graphite,
W79-00431 5D

CHEMICAL ANALYSIS
The Determination of Quantity and Quality of Great Lakes United States Shoreline Eroded Material,
W79-00249 5B

Groundwater Quality Atlas of Nebraska,
W79-00252 7C

Automated Determination of Selenium in Water,
W79-00261 5A

Preliminary Study of Selected Potential Environmental Contaminants - Optical Brighteners, Methyl Chloroform, Tri-Chloroethylene, Tetrachloroethylene and ion Exchange Resins,
W79-00283 5A

Manual of Analytical Quality Control for Pesticides and Related Compounds in Human and Environmental Samples,
W79-00287 5A

CHEMICAL DEGRADATION
Degradation of Aqueous Phenol Solution by Gamma Irradiation,
W79-00153 5D

CHEMICAL FEED PUMPS
Water Treatment: Iron, Boiler Water and Water Analysis.
W79-00176 5F

CHEMICAL INHIBITORS (PLANTS)
Chemical Inhibitors of Plant Transpiration: IV. Action of Alar-85, (In French),
W79-00247 2D

CHEMICAL PRECIPITATION
Removal of Complex Copper-Ammonia Ions from Aqueous Wastes with Fly Ash,
W79-00155 5D

Recovery of Tin from Electroplating Solutions and Rinse Waters,
W79-00157 5D

Hydrolysis of Iron from Acidic Liquors,
W79-00228 5D

Dewatering of Sludges from Oil Fried Electric Power Generating Plants,
W79-00360 5D

CHEMICAL PROPERTIES
Geologic Studies to Identify the Source for High Levels of Radium and Barium in Illinois Ground-Water Supplies: A Preliminary Report,
W79-00003 5A

The Environmental Effects of Chromium in Tannery Effluents,
W79-00156 5C

Biological Effects and Environmental Aspects of 1,3-Butadiene,
W79-00292 5C

CHEMICAL REACTION
Low Toxic Corrosion Inhibitors for Aluminum in Fresh Water,
W79-00091 8G

CHEMICAL REACTIONS
Evaluation of Donnan Dialysis for the Enrichment of Cations,
W79-00434 5A

Investigations of the Molecular Weight, Free Radical and Metal Interactions of Isolated Aquatic and Soil Fulvic Acid,
W79-00436 1B

CHEMICAL WASTES
Sea-Water Neutralization of Effluents from the Industrial Processing of Phosphorite. A Case Study in the Practical Use of Basic Knowledge in Analytical and Marine Chemistry,
W79-00151 5G

Degradation of Aqueous Phenol Solution by Gamma Irradiation,
W79-00153 5D

UNOX Wastewater Treatment System Performance Silicone Chemical Complex,
W79-00349 5D

CHEMICALS
The Biological Effects of Toxic Material Spills,
W79-00344 5C

CHEMOTAXIS
Studies in Microbial Chemotactic Behavior in Seawater,
W79-00293 5C

CHERNOZEMS
Reclamation of Meadow-Chernozem Solonetzes of the Kustanai Oblast, (In Russian),
W79-00395 2G

CHESAPEAKE BAY
Annual Subsurface Transport of a Red Tide Dinoflagellate to its Bloom Area: Water Circulation Patterns and Organism Distributions in the Chesapeake Bay,
W79-00317 5C

A Comparison by Size Class and Volume of Detritus Versus Phytoplankton in Chesapeake Bay,
W79-00494 2L

CHICAGO (ILL)
Tunnel Component of the Tunnel and Reservoir Plan Proposed by the Metropolitan Sanitary District of Greater Chicago, Lower Des Plaines Tunnel System.
W79-00465 5D

CHINOOK SALMON
Rearing of Chinook Salmon in Tributaries of the South Fork Salmon River, Idaho,
W79-00428 8I

CHLORIDES
On-Site Generation of Hypochlorite Solutions by Electrolysis of Seawater,
W79-00372 5F

CHLORINATED HYDROCARBON PESTICIDES
Toxicity of Sodium Pentachlorophenate (NA-PCP) to the Grass Shrimp, Palaemonetes Pugio, at Different Stages of the Molt Cycle,
W79-00078 5C

Identification of Kepone Alteration Products in Soil and Mullet,
W79-00080 5A

Criteria Document for DDT.
W79-00276 5A

Criteria Document for Toxaphene.
W79-00281 5A

Criteria Documents for Aldrin/Dieldrin.
W79-00282 5A

PCB in Water, A Bibliography, Volume 3.
W79-00305 5A

CHLOROFLUOROCARBON
Chlorofluorocarbons as Hydrologic Tracers A New Technology,
W79-00461 5A

CHLOROPHYLL
Biocenosis of a High Mountain Stream Under the Influence of Tourism. 1. Chemism of the Rybi Potok Waters and the Chlorophyll Content in Attached Algae and Seston in Relation to the Pollution,
W79-00218 5C

CHOWAN RIVER BASIN (NC)
Nature and Impact of Rural Stream Inputs on Water Quality,
W79-00483 5C

CHROMIUM
Controls Drive Platers to Materials Recovery,
W79-00154 5D

The Environmental Effects of Chromium in Tannery Effluents,
W79-00156 5C

CHRYSOTILE
Is Chrysotile Asbestos Released from Asbestos-Cement Pipe into Drinking Water.,
W79-00013 5A

Determination of Chrysotile Asbestos in Rainwater,
W79-00014 5A

Characterization of the Release of Chrysotile Asbestos from Asbestos-Cement Drinking Water Pipe,
W79-00435 5B

Investigation of Rainwater for the Presence of Asbestos,
W79-00437 5A

CITIES
Relation Between the St. Louis Urban Precipitation Anomaly and Synoptic Weather Factors,
W79-00328 2B

Residential Water Conservation,
W79-00440 3D

CLADOSPORIUM
Report of a Dematiaceous Hyphomycete from the Great Salt Lake, Utah,
W79-00297 2H

CLAMS
Musculium Transversum in the Illinois River and an Acute Potassium Bioassay Method for the Species,
W79-00443 5C

CLARIFIERS
Clarifier With Suspended Layer of Sediment (Osvetlitel' so vzveshennym sloem osadka),
W79-00421 5D

CLASSIFICATION
Optical Classification of Natural Waters,
W79-00318 2L

CLAYEY
Rational Determination of Underdrainage System from the Hydraulic Point of View: Studies on Underdrainage of Clayey Paddy Soil: III. (In Japanese),
W79-00199 2G

CLAYS
Water Relations of Fritted Clays,
W79-00476 2G

Seepage Control by Particle Size Selection,
W79-00484 4A

CLIMATOLOGY
Climatology of Instantaneous Rainfall Rates,
W79-00327 2B

CLOCK-HOURLY PRECIPITATION
A Technique for Estimating Clock Two-Hourly Precipitation Rate Distributions,
W79-00089 2B

CLOCK TWO-HOURLY PRECIPITATION
A Technique for Estimating Clock Two-Hourly Precipitation Rate Distributions,
W79-00089 2B

CLOSED-CYCLE COOLING
Wet Cooling Tower Backfitting Economics,
W79-00233 5G

CLOUD PHYSICS
Simulation of Cold Cloud Precipitation in a Three Dimensional Mesoscale Model,
W79-00468 2B

COAGULATION
Waste Water Treatment and Re-use within the Textile Industry,
W79-00165 5D

Final Report on Field Test Evaluation and Operation and Maintenance of Seawater Reverse Osmosis and Electrodialysis Pilot Plants at Wrightsville Beach Test Facility, November 1976,
W79-00302 3A

COAL POWERPLANTS
Sampling and Modeling of Non-Point Sources at a Coal-Fired Utility,
W79-00279 5B

COALS
Analysis of Radioactive Contaminants in By-Products from Coal-Fired Power Plant Operations,
W79-00227 5A

Sampling and Modeling of Non-Point Sources at a Coal-Fired Utility,
W79-00279 5B

Treatment of Liquid Wastes from Fossil Fuel Power Plants,
W79-00355 5D

COASTS
Inertial Currents Over the Inner Shelf Near 30 Degree N,
W79-00133 2L

A Study of Coastal Pollution and Agency Interface,
W79-00389 5G

COFFERDAMS
Allowing for the Water Permeability of Frozen Ground Screens During their Formation,
W79-00467 8D

COLD WEATHER CONSTRUCTION
Using Ice as Water-Impermeable Element in Rockfill Dams,
W79-00466 8D

COLIFORMS
Recovery of Sanitary-Indicator Bacteria from Streams Containing Acid Mine Water,
W79-00444 5A

COLLOIDS
Functions and Properties of Drilling Mud.
W79-00186 8G

COLOR
Waste Water Treatment and Re-use within the Textile Industry,
W79-00165 5D

Process for Purifying Aqueous Industrial Effluents.
W79-00399 5D

COLORADO
Grazing and Logging Effects on Soil Surface Changes in Central Colorado's Ponderosa Pine Type,
W79-00140 4C

Water-Resources Appraisal of the Wet Mountain Valley, in Parts of Custer and Fremont Counties, Colorado,
W79-00274 4B

COLORADO PLATEAU
Regional Geology Series: Part VII, The Colorado Plateau,
W79-00177 8B

COLORADO RIVER
A Periphytic Microflora Analysis of the Colorado River and Major Tributaries in Grand Canyon and Vicinity,
W79-00285 5A

COLORADO RIVER BASIN
Reject Stream Replacement Study.
W79-00092 3A

COLORADO RIVER STORAGE
Water and Land Resource Accomplishments 1975, Statistical Appendix III--Project Data.
W79-00194 3F

COMMERCIAL FISHING
Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion,
W79-00231 6B

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion (Anderson),
W79-00235 6E

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management,
W79-00240 6E

COMMUNITY DEVELOPMENT
A Comparative Study of Community Response to Water Related Problems,
W79-00010 6B

COMMUNITY POWER
A Comparative Study of Community Response to Water Related Problems,
W79-00010 6B

COMPARATIVE BENEFITS
Critical Analysis of Flotation Performance,
W79-00376 5D

COMPOSITE MEMBRANES
Laboratory Studies on Advanced Composite H F Modules for Seawater Reverse Osmosis,
W79-00300 3A

COMPOUND CHANNEL
Momentum Transfer in a Compound Channel,
W79-00334 8B

COMPUTER MODELS
Literature Review for Explore-I: A River Basin Water Quality Model. Appendix A,
W79-00188 5B

User's Manual for EXPLORE-I: A River Basin Water Quality Model. Appendix B,
W79-00189 5B

Programmer's Manual for EXPLORE-I: A River Basin Water Quality. Appendix C,
W79-00190 5B

Ground-Water Availability in the Hitchcock-Red Willow, Frenchman Valley, and Meeker-Driftwood Irrigation Districts, Southwest Nebraska,
W79-00260 4B

A Digital Model of Part of the Rio Tempisque Alluvial Aquifer, Costa Rica,
W79-00311 2F

A Water Quality Model for the South Platte River Basin, Documentation Report,
W79-00398 5B

CONDENSATES
Steam Stripping Reduces Condensate at Weyco Mill,
W79-00409 3E

CONDENSATION
Nekoosa Cleans Condensates with Steam Distillation,
W79-00162 5D

CONFERENCES
Research to Anticipate Environmental Impacts of Changing Resource Usage.
W79-00085 6G

CONJUNCTIVE USE
Conjunctive Use of Ground and Surface Water,
W79-00170 4B

CONNATE WATER
Changes in Interstitial Water Salinity of a Mississippi Tidal Marsh,
W79-00338 2L

CONNECTICUT
The Effect of Reduced Wetlands and Storage Basins on the Size, Stability and Productivity of the Watershed Mixing Zone,
W79-00441 2L

CONSERVATION
Protection of Outdoor Recreation Values of Rivers.
W79-00093 6B

Residential Water Conservation,
W79-00440 3D

CONSTRUCTION COSTS
Water and Land Resource Accomplishments 1975, Statistical Appendix II-Finances and Physical Features.
W79-00193 3F

Economic Analysis of Selected Features of Municipal Wastewater Construction Grant Legislation,
W79-00246 5G

Cost Estimates for Construction of Publicly-Owned Treatment Facilities, 1974 'Needs' Survey, Final Report to the Congress.
W79-00248 5G

CONSUMPTIVE USE
Progress and Problems in the Study of Plant-Water Interrelations (In Bulgarian),
W79-00187 2I

CONTAMINATION (AIR)
Wastewater Odor Problem Solving -- Process Modification Versus Air Treatment,
W79-00373 5D

CONTINENTAL SHELF
Inertial Currents Over the Inner Shelf Near 30 Degree N,
W79-00133 2L

CONTROL
Management Plan for Control and Treatment of Toxic Substances,
W79-00346 5G

CONTROL SYSTEMS
Simple Sampler Activation and Recording System,
W79-00480 7B

CONTROLS
Instrumentation and Controls for Philadelphia Electric Company Eddystone Generating Station Wastewater Treatment System,
W79-00357 5D

COOLING
Direct Cooling with Ground Water,
W79-00173 8C

Housing Project to Utilize Ground Water.
W79-00178 8C

COOLING TOWERS
Wet Cooling Tower Backfitting Economics,
W79-00233 5G

COPPER
Removal of Complex Copper-Ammonia Ions from Aqueous Wastes with Fly Ash,
W79-00155 5D

Aquatic Inhabitants of a Mine Waste Stream in Arizona,
W79-00426 5C

CORN (FIELD)
Stomatal and Nonstomatal Regulation of Water Use in Cotton, Corn and Sorghum,
W79-00016 2I

Profile Accumulation of Fertilizer-Derived Nitrate and Total Nitrogen Recovery in Two Long-Term Nitrogen-Rate Experiments with Corn,
W79-00500 2G

CORROSION CONTROL
Low Toxic Corrosion Inhibitors for Aluminum in Fresh Water,
W79-00091 8G

COST-BENEFIT ANALYSIS
Conceptual and Statistical Issues in Developing Environmental Measures - Recent U.S. Experience,
W79-00232 6G

COST REPAYMENT
Water and Land Resource Accomplishments 1975, Statistical Appendix II-Finances and Physical Features.
W79-00193 3F

Water and Land Resource Accomplishments 1975, Statistical Appendix III--Project Data.
W79-00194 3F

COSTA RICA
A Digital Model of Part of the Rio Tempisque Alluvial Aquifer, Costa Rica,
W79-00311 2F

COSTS
Conceptual and Statistical Issues in Developing Environmental Measures - Recent U.S. Experience,
W79-00232 6G

Wet Cooling Tower Backfitting Economics,
W79-00233 5G

Residential Water Conservation,
W79-00440 3D

COTTON
Stomatal and Nonstomatal Regulation of Water Use in Cotton, Corn and Sorghum,
W79-00016 2I

CRABS
Toxicity of the Fungicide Captan to the Dungeness Crab Cancer Magister,
W79-00065 5C

CRITICISMS
An Analysis of Criticisms of International Fishery Organizations with Reference to Three Agencies Associated with the Canadian West Coast Fishery,
W79-00394 6E

CROP PRODUCTION
Effect of Soil-Injected Ethylene on Sugarbeet (Beta Vulgaris L.) Yield Parameters,
W79-00296 3F

CROP RESPONSE
Water and Land Resource Accomplishments 1975. Summary Report.
W79-00191 3F

Effect of Whey Application on Chemical Properties of Soils and Crops,
W79-00363 5E

Profile Accumulation of Fertilizer-Derived Nitrate and Total Nitrogen Recovery in Two Long-Term Nitrogen-Rate Experiments with Corn,
W79-00500 2G

CROP VALUE
Water and Land Resource Accomplishments 1975, Statistical Appendix I.
W79-00192 3F

CRYSTALLIZATION
Hydrolysis of Iron from Acidic Liquors,
W79-00228 5D

CTENOPHARYNGODON IDELLA
Overgrowing of the Kara Kum Canal and Some Aftereffects of Introducing the White Amur into Water Bodies, (In Russian),
W79-00207 4A

CULTIVATED LANDS
Water and Land Resource Accomplishments 1975, Statistical Appendix I.
W79-00192 3F

CURRENTS (WATER)
Inertial Currents Over the Inner Shelf Near 30 Degree N,
W79-00133 2L

Regional Response to Forcing in Southern Strait of Georgia,
W79-00324 2L

CURVES
Type-Curve Analysis of Time-Drawdown Data for Partially Penetrating Wells in Unconfined Anisotropic Aquifers,
W79-00136 2F

DAM FAILURE
Analysis of Flood Resulting from the Toccoa Falls, Georgia, Dam Break,
W79-00262 2E

Model of the Flooding Caused by the Failure of the Laurel Run Reservoir Dam, July 19-20, 1977, near Johnstown, Pennsylvania,
W79-00263 2E

Computing Two-Dimensional Dam-Break Flood Waves,
W79-00313 8A

DAMINOZIDE
Chemical Inhibitors of Plant Transpiration: IV. Action of Alar-85, (In French),
W79-00247 2D

DAMS
Free-Surface Seepage Problem,
W79-00496 8D

DARKNESS
Photosynthesis and Carbon Metabolism in Marine and Freshwater Diatoms,
W79-00208 5C

DARTERS
Species Diversity Indices of the Fish Populations of Streams Draining Selected Test Areas on Eglin Air Force Base Reservation Florida,
W79-00277 7C

DATA COLLECTIONS
Data Base System for State Water Quality Management Information System.
W79-00222 5G

DBH
Microbial Degradation of DDT,
W79-00278 5C

DBP
Microbial Degradation of DDT,
W79-00278 5C

DDA
Microbial Degradation of DDT,
W79-00278 5C

DDM
Microbial Degradation of DDT,
W79-00278 5C

DDT
Criteria Document for DDT.
W79-00276 5A

Microbial Degradation of DDT,
W79-00278 5C

DEBRIS FLOW
Mechanical Characteristics of Debris Flow,
W79-00117 2J

DECISION-MAKING
A Comparative Study of Community Response to Water Related Problems,
W79-00010 6B

The Development of the Electrical Power System in the Pacific Northwest, A Public Policy Perspective,
W79-00143 6E

Modeling for Organizational Decision-Making: Profits vs. Social Values in Resource Management,
W79-00243 6A

DEGRADATION (DECOMPOSITION)
Identification of Kepone Alteration Products in Soil and Mullet,
W79-00080 5A

Phytoplankton Extracellular Release and Its Relation to the Seasonal Cycle of Dissolved Organic Carbon in a Eutrophic Lake,
W79-00213 5C

DELAWARE RIVER BASIN
Water Resources Data for Pennsylvania, Water Year 1977--Volume 1. Delaware River Basin.
W79-00266 7C

DEMAND
Residential Water Conservation,
W79-00440 3D

DEMINERALIZATION
Treatment of Water or Aqueous Systems,
W79-00039 5F

Desalination Process Using Thermally Regenerable Resins,
W79-00057 3A

DENITRIFICATION
Denitrifying Bacteria Can be Enumerated in Nitrite Broth,
W79-00498 2G

DENSITY CURRENTS
Internal Fronts in Two-Layer Flo,
W79-00486 8B

DEPARTMENT OF ENERGY RESEARCH
Summaries of Physical Research in the Geosciences.
W79-00101 10F

DESALINATION
Vapor Compression Energy Reduction by Vertical Tube Foam Evaporation of Seawater,
W79-00015 3A

Process for the Treatment of Water Solution by Ion Exchange,
W79-00054 5F

Desalination Process Using Thermally Regenerable Resins,
W79-00057 3A

Reject Stream Replacement Study.
W79-00092 3A

Laboratory Studies on Advanced Composite H F Modules for Seawater Reverse Osmosis,
W79-00300 3A

Increased Product Water Recovery by Reverse Osmosis Using Interstage Ion Exchange Softing and a Spiractor,
W79-00301 3A

High Temperature Elctrodialysis-Phase VI,
W79-00303 3A

Development of Low Cost Membrane Cleaning Agents,
W79-00304 3A

DESALINATION PLANTS
Vapor Compression Energy Reduction by Vertical Tube Foam Evaporation of Seawater,
W79-00015 3A

Final Report on Field Test Evaluation and Operation and Maintenance of Seawater Reverse Osmosis and Electrodialysis Pilot Plants at Wrightsville Beach Test Facility, November 1976,
W79-00302 3A

DESALINATION PROCESSES
Increased Product Water Recovery by Reverse Osmosis Using Interstage Ion Exchange Softing and a Spiractor,
W79-00301 3A

Development of Low Cost Membrane Cleaning Agents,
W79-00304 3A

DESIGN
Design Considerations for Wastewater Treatment Systems at Existing Fossil Power Plants,
W79-00358 5D

DETERMINISTIC MODELING
Stormwater Modeling,
W79-00381 5B

DETRITUS
A Comparison by Size Class and Volume of Detritus Versus Phytoplankton in Chesapeake Bay,
W79-00494 2L

DEWATERING
Groundwater Pumping Techniques for Excavations and Other Works,
W79-00185 8G

Case History: Ash Disposal from an Oil Fried Central Station,
W79-00361 5E

Sludge Treatment by Supersonic Jet-Flame,
W79-00403 5E

DIALYSIS
Evaluation of Donnan Dialysis for the Enrichment of Cations,
W79-00434 5A

DIATOMS
Photosynthesis and Carbon Metabolism in Marine and Freshwater Diatoms,
W79-00208 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 3. Attached Algae Communities in the Stream Rybi Potok (The High Tatra Mts, Poland) Polluted with Domestic Sewage,
W79-00220 5C

Continuous Culture of Marine Diatoms Under Silicon Limitation. 3. A Model of Si-Limited Diatom Growth,
W79-00229 5C

First Ecological Data on the Oyster Ponds in the Bay of Bourgneuf (In French),
W79-00295 2L

DIBENZOFURANS
Acute and Chronic Oral Toxicity of Chlroinated Dibenzofurans to Salmonid Fishes,
W79-00062 5C

DIEL CYCLES
Diel Cycles of Inorganic Nitrogen Uptake in a Natural Phytoplankton Population Dominated by Gonyaulax Polyedra,
W79-00210 5C

DIEL MIGRATION
Diel Cycles of Inorganic Nitrogen Uptake in a Natural Phytoplankton Population Dominated by Gonyaulax Polyedra,
W79-00210 5C

DIELDRIN
Criteria Documents for Aldrin/Dieldrin.
W79-00282 5A

DIFFUSION
Pollution of Groundwater Through Nonlinear Diffusion,
W79-00110 5B

DINOFLAGELLATES
Annual Subsurface Transport of a Red Tide Dinoflagellate to its Bloom Area: Water Circulation Patterns and Organism Distributions in the Chesapeake Bay,
W79-00317 5C

DISCHARGE (WATER)
A Novel Method of Estimating the Discharge of Water from Mound Springs of the Great Artesian Basin, Central Australia,
W79-00112 2F

Field Investigation of Selective Withdrawal,
W79-00119 4A

An Estimate of Annual Runoff from England and Wales, 1728-1976,
W79-00124 2E

On Geostrophic Adjustment in Sea Straits and Wide Estuaries. Part I: One-Layer System,
W79-00131 2L

DISCOUNT RATES
Land Prices Substantially Underestimate the Value of Environmental Quality,
W79-00244 6C

DISINFECTANT
On-Site Generation of Hypochlorite Solutions by Electrolysis of Seawater,
W79-00372 5F

DISINFECTION
New Technology: Ozone/UV Chemical Oxidation Wastewater Process for Metal Complexes, Organic Species and Disinfection,
W79-00369 5D

DISPERSION
Longitudinal Dispersion of Fluid Particles in Mountain Streams: I. Theory and Field Evidence,
W79-00308 5B

Longitudinal Dispersion of Fluid Particles in Mountain Streams: 2. Similarity of the Mean Motion and Its Application,
W79-00309 5B

DISSOLVED ORGANIC CARBON
Phytoplankton Extracellular Release and Its Relation to the Seasonal Cycle of Dissolved Organic Carbon in a Eutrophic Lake,
W79-00213 5C

DISSOLVED OXYGEN
Study of the Fishes of the Lagoon of Alvarado, Veracruz, Mexico (In Spanish),
W79-00079 2L

Effects of Dissolved Oxygen in the Oxygenation Activated Sludge Process,
W79-00351 5D

DISTILLATION
Vapor Compression Energy Reduction by Vertical Tube Foam Evaporation of Seawater,
W79-00015 3A

Water Distiller with Cone Shaped Condenser,
W79-00045 5F

Nekoosa Cleans Condensates with Steam Distillation,
W79-00162 5D

DISTRIBUTION
Effect of Environmental Factors on the Distribution of Caddis Fly Larvae in Small Rivers (In Russian),
W79-00147 2I

Distributional Implications of the Extended Economic Zone: Some Policy and Research Issues in the Fishery,
W79-00236 6E

Distributional Implications of Extended Fisheries Jurisdiction: Some Research and Policy Issues: Discussion,
W79-00237 6E

Distributional Implications of the Extended Economic Zone: Some Policy and Research Issues in the Fishery: Discussion,
W79-00238 6E

DIVERSITY
Species Diversity Indices of the Fish Populations of Streams Draining Selected Test Areas on Eglin Air Force Base Reservation Florida,
W79-00277 7C

DOMINANT ORGANISMS
Phytophilous Fauna in Ponds Fertilized with Sugar Factory Wastes,
W79-00217 5C

DOOR COUNTY
Geology and Ground Water in Door County, Wisconsin, with Emphasis on Contamination Potential in the Silurian Dolomite,
W79-00256 5B

DRAINAGE
Rational Determination of Underdrainage System from the Hydraulic Point of View: Studies on Underdrainage of Clayey Paddy Soil: III. (In Japanese),
W79-00199 2G

DRAWDOWN
Type-Curve Analysis of Time-Drawdown Data for Partially Penetrating Wells in Unconfined Anisotropic Aquifers,
W79-00136 2F

DREDGE SPOIL
Vegetative Stabilization of Dredge Spoil in North Florida,
W79-00337 5G

DREDGING
Laboratory Study of the Release of Pesticide and PCB Materials to the Wate Column During Dredging and Disposal Operations,
W79-00286 5A

Vegetative Stabilization of Dredge Spoil in North Florida,
W79-00337 5G

DREISSENA
Ecology of Dreissena Polymorpha (Pall.) (Dreissenidae, Bivalvia) in Lakes Receiving Heated Water Discharges,
W79-00068 5C

DRILLING
Water Analytical Data as a Tool in Drilling and Production Economics,
W79-00168 8G

Regional Geology Series: Part VII, The Colorado Plateau,
W79-00177 8B

DRILLING FLUIDS
Functions and Properties of Drilling Mud.
W79-00186 8G

DRIP IRRIGATION
Drip Irrigation System,
W79-00038 3F

DROPS (FLUIDS)
Seven Problems in Bubble and Jet Drop Researchers,
W79-00319 8B

DROUGHT RESISTANCE
Stomatal and Nonstomatal Regulation of Water Use in Cotton, Corn and Sorghum,
W79-00016 2I

Water Relations and Physiological Activity of Potatoes,
W79-00017 2I

DROUGHT TOLERANCE
Stomatal and Nonstomatal Regulation of Water Use in Cotton, Corn and Sorghum,
W79-00016 2I

Water Relations and Physiological Activity of Potatoes,
W79-00017 2I

DRY MATTER
Growth Aspects of Green Ash Seedlings in Years Varying in Moisture (In Russian),
W79-00018 2I

DUNES
An Investigation of Primary Production and Ecosystem Metabolism in a Lake Michigan Dune Pond,
W79-00205 5C

DURATION CURVES
Rainfall Frequencies for the Persian Gulf Coast of Iran,
W79-00123 2B

DUSTS
Collecting Bark Burner Ash with Electrostatic Precipitators,
W79-00163 5D

DYES
Method for Clarifying Aqueous Waste Liquids Containing Acid Dyes,
W79-00053 5D

Textile Waste Waters: Treatment and Environmental Effects,
W79-00166 3E

DYNAMIC PROGRAMMING
Dynamic Programming and the Principle of Optimality: A Systematic Approach,
W79-00396 6A

EARTHWORMS
Effects of Municipal Sewage Effluent Irrigation on the Trace Metal Content of Earthworms,
W79-00009 5C

ECOLOGY
Research to Anticipate Environmental Impacts of Changing Resource Usage.
W79-00085 6G

Fish and Wildlife Inventory of the Seven-County Region Included in the Central Florida Phosphate Industry Area-Wide Environmental Impact Study. Volumes I and II,
W79-00100 5C

ECONOMIC EFFICIENCY
Economic Analysis of Selected Features of Municipal Wastewater Construction Grant Legislation,
W79-00246 5G

ECONOMIC IMPACT
Economic Impacts of Pulp and Paper Industry Compliance with Environmental Regulations. Volume I. Summary and Aggregate Industry Impact Analyses.
W79-00430 6E

A Model for Evaluating Alternative Land Developments Around Lakes,
W79-00460 4C

ECONOMICS
Heat Pump Accessories Can Save You Money,
W79-00174 8C

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion,
W79-00231 6B

Wet Cooling Tower Backfitting Economics,
W79-00233 5G

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion (Anderson),
W79-00235 6E

Distributional Implications of the Extended Economic Zone: Some Policy and Research Issues in the Fishery,
W79-00236 6E

Distributional Implications of Extended Fisheries Jurisdiction: Some Research and Policy Issues: Discussion,
W79-00237 6E

Distributional Implications of the Extended Economic Zone: Some Policy and Research Issues in the Fishery: Discussion,
W79-00238 6E

The Optimal Pricing of Undepletable Externalities,
W79-00239 6C

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management,
W79-00240 6E

Property Rules, Liability Rules, and Environmental Economics,
W79-00241 6E

Natural Resource Economics: The Upsetting Discipline,
W79-00242 6B

COSYSTEMS
The Biological Effects of Toxic Material Spills,
W79-00344 5C

DDIES
Eddy Production Inside Wall Layers,
W79-00333 8B

FFECTS
Lake Superior Regulation Effects,
W79-00388 4C

Tunnel Component of the Tunnel and Reservoir Plan Proposed by the Metropolitan Sanitary District of Greater Chicago, Lower Des Plaines Tunnel System.
W79-00465 5D

FFLUENTS
A Socio-Economic Approach to Water Pollution Law Enforcement in England and Wales,
W79-00245 5G

Modeling and Monitoring of Toxic Spills and Toxic Effluents,
W79-00343 5B

LECTRIC POWERPLANTS
Analysis of Radioactive Contaminants in By-Products from Coal-Fired Power Plant Operations,
W79-00227 5A

LECTRICAL CONDUCTANCE
Electrical-Resistivity Surveys for Groundwater in the Deccan Trap Country of Sangli District, Maharashtra,
W79-00107 4B

LECTRICAL POWER SYSTEM
The Development of the Electrical Power System in the Pacific Northwest, A Public Policy Perspective,
W79-00143 6E

LECTROCHEMISTRY
Continuous Electrochemical Synthesis Using a Packed Granular Electrode,
W79-00432 5D

LECTRODES
Collecting Bark Burner Ash with Electrostatic Precipitators,
W79-00163 5D

Ion Selective Electrodes in Water Quality Analysis,
W79-00223 5A

Studies of Ion Exchange and Chelation Compounds Adsorbed on Granular Graphite,
W79-00431 5D

Continuous Electrochemical Synthesis Using a Packed Granular Electrode,
W79-00432 5D

LECTRODIALYSIS
Controls Drive Platers to Materials Recovery,
W79-00154 5D

Final Report on Field Test Evaluation and Operation and Maintenance of Seawater Reverse Osmosis and Electrodialysis Pilot Plants at Wrightsville Beach Test Facility, November 1976,
W79-00302 3A

High Temperature Elctrodialysis-Phase VI,
W79-00303 3A

Energy Consumption for Electrodialysis of Spent Sulfite Liquors (Energozatraty na elektrodializ otrabotannogo shcheloka sul'fitnotsellyuloznogo proizvodstva),
W79-00416 5D

Electric Resistance of the Cation-Selective MK-40 Membrane During Electrodialysis of Spend Sulfite Liquor (Elektrosoprotivlenie kationoselektivnoy membrany MK-40 pri elektrodialze otrabotannogo sul'fitnogo shcheloka),
W79-00417 5A

ELECTROFISHING
Nonmetallic Electrofishing Booms and Accessory Tackle,
W79-00069 7B

ELECTROLYSIS
Battery Operated Water Purification System,
W79-00043 5F

On-Site Generation of Hypochlorite Solutions by Electrolysis of Seawater,
W79-00372 5F

ELECTRON MICROSCOPY
Is Chrysotile Asbestos Released from Asbestos-Cement Pipe into Drinking Water.,
W79-00013 5A

Determination of Chrysotile Asbestos in Rainwater,
W79-00014 5A

ELY
Energy Consumption of Advanced Wastewater Treatment at Ely, Minnesota,
W79-00102 5D

EMISSION STANDARDS
The Optimal Pricing of Undepletable Externalities,
W79-00239 6C

EMULSIONS
Oil/Water Separation Technology: The Options Available - Part 2,
W79-00158 5G

Removal of Ammonium Sulfide from Wastewater by Liquid Membrane Process,
W79-00161 5D

ENERGY
Energy Conservation and Outdoor Recreation,
W79-00096 6G

Looking at the Positive Side of Energy Regulation,
W79-00411 3E

Energy Consumption for Electrodialysis of Spent Sulfite Liquors (Energozatraty na elektrodializ otrabotannogo shcheloka sul'fitnotsellyuloznogo proizvodstva),
W79-00416 5D

A Mathematical Model for Simulating Water Demand-Supply and Energy Uses for the State of Pennsylvania,
W79-00442 8A

Resource Analysis: Water and Energy as Linked Resources,
W79-00453 6D

ENERGY CONSERVATION
Energy Conservation and Outdoor Recreation,
W79-00096 6G

How to Utilize Steam from Thermorefiners. (Hur utnyttja anga fran termoraffinoerer),

Property Rules, Liability Rules, and Environmental Economics,
W79-00241 6E

FALLOUT
Mass Balance Model for Calculation of Ionic Input Loads in Atmospheric Fallout and Discharge from a Mountainous Basin,
W79-00332 5B

FEDERAL CONSTRUCTION GRANT PROGRAM
Economic Analysis of Selected Features of Municipal Wastewater Construction Grant Legislation,
W79-00246 5G

FEDERAL FUNDS
Water and Land Resource Accomplishments 1975, Statistical Appendix II-Finances and Physical Features.
W79-00193 3F

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972
Economic Analysis of Selected Features of Municipal Wastewater Construction Grant Legislation,
W79-00246 5G

Cost Estimates for Construction of Publicly-Owned Treatment Facilities, 1974 'Needs' Survey, Final Report to the Congress.
W79-00248 5G

FERRIC OXIDE
Hydrolysis of Iron from Acidic Liquors,
W79-00228 5D

ERTILIZATION
Profile Accumulation of Fertilizer-Derived Nitrate and Total Nitrogen Recovery in Two Long-Term Nitrogen-Rate Experiments with Corn,
W79-00500 2G

ERTILIZERS
Use of Hydrolysis Lignin for Purification of Effluents from Ammonia Production and the Preparation of Complex Fertilizers (Primenenie gidroliznogo lignina dlya ochistki stochnykh vod ammiachnogo proizvodstva i polucheniya slozhnykh udobrenii),
W79-00402 5D

Profile Accumulation of Fertilizer-Derived Nitrate and Total Nitrogen Recovery in Two Long-Term Nitrogen-Rate Experiments with Corn,
W79-00500 2G

LTRATION
Water -- 1977.
W79-00342 5D

New Developments in Oil Interception by Filtration,
W79-00364 5D

Molecular Fractionation by Staged Ultrafiltration,
W79-00367 5D

Characterization of Performance of Full-Scale Tertiary Wastewater Granular Media Filters,
W79-00371 5D

EPA's Goal for Suspended Solids is Not Met with Media Filtration,
W79-00414 5D

INITE DIFFERENCE ANALYSIS
Comparison of Finite-Element and Finite-Difference Schemes. Part II: Two-Dimensional Gravity Wave Motion,
W79-00130 2L

INITE DIFFERNCE ANALYSIS
Comparison of Finite-Element and Finite-Difference Schemes. Part I: One-Dimensional Gravity Wave Motion,
W79-00129 2L

INITE ELEMENT ANALYSIS
Comparison of Finite-Element and Finite-Difference Schemes. Part I: One-Dimensional Gravity Wave Motion,
W79-00129 2L

Comparison of Finite-Element and Finite-Difference Schemes. Part II: Two-Dimensional Gravity Wave Motion,
W79-00130 2L

A New Finite Element Technique for the Solution of Two-Phase Flow Through Porous Media,
W79-00135 2F

INITE ELEMENT MODEL
A Model for Evaluating the Effect of Land Uses on Flood Flows,
W79-00450 4C

ISH
Fish and Wildlife Inventory of the Seven-County Region Included in the Central Florida Phosphate Industry Area-Wide Environmental Impact Study. Volumes I and II,
W79-00100 5C

Bioassay Results of Kraft Mill Effluent at Artificially Elevated Levels of Biosolids,
W79-00406 5C

Hydrochemical Influences on the Fishery Within the Phosphate Mining Area of Eastern Idaho,
W79-00427 5C

FISH DIETS
Stamina Tunnel Tests on Hatchery-Reared Atlantic Salmon,
W79-00075 8I

Nutrition and Growth of the Bighead Aristichthys Nobilis (Rich.) In Bodies of Water of the Dagestan ASSR,
W79-00320 2H

FISH DISEASES
A Pilot Plant Trial for Ozone Sterilization of Fish Hatchery Water,
W79-00455 5G

FISH HATCHERIES
A Pilot Plant Trial for Ozone Sterilization of Fish Hatchery Water,
W79-00455 5G

FISH MANAGEMENT
Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion,
W79-00231 6B

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion (Anderson),
W79-00235 6E

Distributional Implications of the Extended Economic Zone: Some Policy and Research Issues in the Fishery,
W79-00236 6E

Distributional Implications of Extended Fisheries Jurisdiction: Some Research and Policy Issues: Discussion,
W79-00237 6E

Distributional Implications of the Extended Economic Zone: Some Policy and Research Issues in the Fishery: Discussion,
W79-00238 6E

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management,
W79-00240 6E

FISH PHYSIOLOGY
Stamina Tunnel Tests on Hatchery-Reared Atlantic Salmon,
W79-00075 8I

Growth and Diets of Trout from Contrasting Environments in a Geothermally Heated Stream: The Firehole River of Yellowstone National Park,
W79-00082 5C

FISH POPULATIONS
Collection Bucket for Use with Tow Nets for Larval Fish,
W79-00070 7B

FISH STAMINA
Stamina Tunnel Tests on Hatchery-Reared Atlantic Salmon,
W79-00075 8I

FISH TISSUE RESPIRATION
A Comparative In Vitro Study of the Effects of Various Balanced Saline Solutions on Respiration Rates of Liver Tissues of Three Fish Species,
W79-00454 5C

FISHERIES
Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion,
W79-00231 6B

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion (Anderson),
W79-00235 6E

Distributional Implications of the Extended Economic Zone: Some Policy and Research Issues in the Fishery,
W79-00236 6E

Distributional Implications of Extended Fisheries Jurisdiction: Some Research and Policy Issues: Discussion,
W79-00237 6E

Distributional Implications of the Extended Economic Zone: Some Policy and Research Issues in the Fishery: Discussion,
W79-00238 6E

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management,
W79-00240 6E

An Analysis of Criticisms of International Fishery Organizations with Reference to Three Agencies Associated with the Canadian West Coast Fishery,
W79-00394 6E

FISHES
Study of the Fishes of the Lagoon of Alvarado, Veracruz, Mexico (In Spanish),
W79-00079 2L

FISSURES (GEOLOGIC)
Maps Showing Water-Level Declines, Land Subsidence, and Earth Fissures in South-Central Arizona,
W79-00251 7C

FJORDS
Mixing in an Arctic Fjord,
W79-00487 2L

FLAME PHOTOMETRY
Flame-Photometric Method for the Determination of Magnesium in Spent Liquors of Sulfite Pulp Mills (Plamennofotometricheskii method opredeleniya magniya v shchelokakh sul'fitnotsellyuloznogo proizvodstva),
W79-00415 5A

FLASH FLOODS
Model of the Flooding Caused by the Failure of the Laurel Run Reservoir Dam, July 19-20, 1977, near Johnstown, Pennsylvania,
W79-00263 2E

FLOCCULATION
Waste Water Treatment and Re-use within the Textile Industry,
W79-00165 5D

FLOOD CONTROL
Water and Land Resource Accomplishments 1975. Summary Report.
W79-00191 3F

Lake Level Control and Management--A Case Study,
W79-00390 4A

FLOOD CONTROL

Optimal Operation of Shelbyville and Carlyle Lakes,
W79-00392 4A

FLOOD DATA

Analysis of Flood Resulting from the Toccoa Falls, Georgia, Dam Break,
W79-00262 2E

FLOOD DISCHARGE

Analysis of Flood Resulting from the Toccoa Falls, Georgia, Dam Break,
W79-00262 2E

FLOOD PLAINS

Flood Regions in Jamaica,
W79-00330 2E

Momentum Transfer in a Compound Channel,
W79-00334 8B

FLOOD REGIONS

Flood Regions in Jamaica,
W79-00330 2E

FLOOD WAVES

Computing Two-Dimensional Dam-Break Flood Waves,
W79-00313 8A

FLOODS

Analysis of Flood Resulting from the Toccoa Falls, Georgia, Dam Break,
W79-00262 2E

Flood Regions in Jamaica,
W79-00330 2E

FLOODWATER

Model of the Flooding Caused by the Failure of the Laurel Run Reservoir Dam, July 19-20, 1977, near Johnstown, Pennsylvania,
W79-00263 2E

FLORIDA

Fish and Wildlife Inventory of the Seven-County Region Included in the Central Florida Phosphate Industry Area-Wide Environmental Impact Study. Volumes I and II,
W79-00100 5C

Use of Dummy Variables in Water Resources Studies,
W79-00114 2G

Vegetation of Southeastern Florida -- Parts II - V,
W79-00196 2I

Summary of U.S. Geological Survey Investigations and Hydrologic Conditions in the Southwest Florida Water Management District for 1977,
W79-00272 4A

Vegetative Stabilization of Dredge Spoil in North Florida,
W79-00337 5G

FLOTATION

Oil/Water Separation Technology: The Options Available - Part 2,
W79-00158 5G

Waste Water Treatment and Re-use within the Textile Industry,
W79-00165 5D

Factors Influencing Induced Air Flotation,
W79-00375 5D

Critical Analysis of Flotation Performance,
W79-00376 5D

Removal of Fluoborate from Plating Wastewater: Technique and Mecahnism,
W79-00378 5D

FLOW

Measurements of Bed Load in Oscillatory Flow,
W79-00141 2J

Air Entrainment in Radial Flow Towards Intakes,
W79-00315 8B

Internal Fronts in Two-Layer Flo,
W79-00486 8B

On Geostrophic Adjustment in Sea Straits and Wide Estuaries: Theory and Laboratory Experiments. Part II - Two-Layer System,
W79-00497 2L

FLOW CONTROL

Flow Reducing Devices Particularly Useful as Drip Emitters for Drip Irrigation,
W79-00031 3F

Drip Irrigation System,
W79-00038 3F

FLOW DURATION

Low-Flow Characteristics of Streams on the Olympic Peninsula, Washington,
W79-00258 2E

FLOW MEASUREMENT

The Vertical Planar Motion Mechanism; A Dynamic Test Apparatus for Evaluating Current Meters and Other Marine Instrumentation,
W79-00224 7B

Shunt Meters with Segmental Orifices,
W79-00335 3F

FLOW RATES

Low-Flow Characteristics of Oklahoma Streams,
W79-00257 2E

FLOWMETERS

The Vertical Planar Motion Mechanism; A Dynamic Test Apparatus for Evaluating Current Meters and Other Marine Instrumentation,
W79-00224 7B

FLUCTUATIONS

Pressure Fluctuations Beneath Submerged Jump,
W79-00316 8B

FLUMES

Pressure Fluctuations Beneath Submerged Jump,
W79-00316 8B

FLUOBORATE

Removal of Fluoborate from Plating Wastewater: Technique and Mecahnism,
W79-00378 5D

FLUORIDES

Sea-Water Neutralization of Effluents from the Industrial Processing of Phosphorite. A Case Study in the Practical Use of Basic Knowledge in Analytical and Marine Chemistry,
W79-00151 5G

FLUSHING RATE

Nutrient Loading/Lake Trophic Condition Relationships with Special Reference to the Influence of Flushing Rate,
W79-00001 5C

FLY ASH

Removal of Complex Copper-Ammonia Ions from Aqueous Wastes with Fly Ash,
W79-00155 5D

FOREIGN COUNTRIES

Rainfall Frequencies for the Persian Gulf Coast of Iran,
W79-00123 2B

FOREST FIRES

Brushland Watershed Fire Management Policy in Southern California: Biosocial Considerations,
W79-00449 6B

FOREST MANAGEMENT

Our Reclamation Future: The Missing Bet on Trees,
W79-00086 4C

Modeling for Organizational Decision-Making: Profits vs. Social Values in Resource Management,
W79-00243 6A

FOREST SOILS

Grazing and Logging Effects on Soil Surface Changes in Central Colorado's Ponderosa Pine Type,
W79-00140 4C

Changes in Water Regime of Brown Forest Soils of the Georgian SSR Under the Effect of Silvicultural Practices, (In Russian),
W79-00401 4C

FOREST WATERSHEDS

Influence of Nitrogen Fertilization on the Quality and Quantity of Streamflow from a Forested Watershed,
W79-00448 5B

FORESTRY

Our Reclamation Future: The Missing Bet on Trees,
W79-00086 4C

FORESTS

Summary of Study Findings, Phase I Report: Ecological Effects of Highway Construction Upon Michigan Woodlots and Wetlands,
W79-00195 4C

FOSSIL FUELS

Treatment of Liquid Wastes from Fossil Fuel Power Plants,
W79-00355 5D

Use of Wastewater Treatment Ponds at TVA Fossil Fueled Power Plants,
W79-00356 5D

Design Considerations for Wastewater Treatment Systems at Existing Fossil Power Plants,
W79-00358 5D

FRAINS LAKES (MI)

Phytoplankton Extracellular Release and Its Relation to the Seasonal Cycle of Dissolved Organic Carbon in a Eutrophic Lake,
W79-00213 5C

FRAZIL ICE

Frazil Ice Formation: A Review,
W79-00120 2C

FREE RADICAL

Investigations of the Molecular Weight, Free Radical and Metal Interactions of Isolated Aquatic and Soil Fulvic Acid,
W79-00436 1B

FREQUENCY ANALYSIS
High-Flow Frequencies for Selected Streams in Oklahoma,
W79-00273 2E

FREQUENCY CURVES
Climatology of Instantaneous Rainfall Rates,
W79-00327 2B

FRESHWATER FISH
Nonmetallic Electrofishing Booms and Accessory Tackle,
W79-00069 7B

Collection Bucket for Use with Tow Nets for Larval Fish,
W79-00070 7B

Quantitative Comparison of Seining and Underwater Observation for Stream Fishery Surveys,
W79-00072 7B

FRITTED CLAY
Water Relations of Fritted Clays,
W79-00476 2G

FROTH FLOTATION
Water -- 1977.
W79-00342 5D

Critical Analysis of Flotation Performance,
W79-00376 5D

FROZEN GROUND
Allowing for the Water Permeability of Frozen Ground Screens During their Formation,
W79-00467 8D

FULVIC ACIDS
Investigations of the Molecular Weight, Free Radical and Metal Interactions of Isolated Aquatic and Soil Fulvic Acid,
W79-00436 1B

FUNGI
Microbial Degradation of DDT,
W79-00278 5C

FUNGICIDES
The Toxicity of Manganese Ethylenebisdithiccarbamate to the Adult Newt, Triturus Cristatus,
W79-00064 5C

Toxicity of the Fungicide Captan to the Dungeness Crab Cancer Magister,
W79-00065 5C

FURROW IRRIGATION
Control of Furrow Infiltration by Compaction,
W79-00481 3F

FURROWS
Control of Furrow Infiltration by Compaction,
W79-00481 3F

GALVESTON
Point Source Analysis. Inventory, Water Demands, and Problem Area Identification. (Areawide Waste Treatment Plan for the Greater Houston Area. Section 208, PL 92-500.
W79-00104 6D

GAMMA RAYS
Degradation of Aqueous Phenol Solution by Gamma Irradiation,
W79-00153 5D

The Radiation-Induced Degradation of Lignin in Aqueous Solutions,
W79-00164 5D

GAS CHROMATOGRAPHY
Tracing Sewage Effluent Recharge - Tucson, Arizona,
W79-00299 5A

Chlorofluorocarbons as Hydrologic Tracers A New Technology,
W79-00461 5A

GASES
Transfer of Gases at Natural Air-Water Interfaces,
W79-00127 2L

Laboratory Studies of Gas Tracers for Reaeration,
W79-00270 5A

GASTROPODS
Effects of Feeding and of Chemical Stimulation on the Oxygen Uptake of Nassarius Reticulatus (Gastropoda: Prosobranchia),
W79-00083 5C

GENERAL RECLAMATION STATISTICS
Water and Land Resource Accomplishments 1975, Statistical Appendix II-Finances and Physical Features.
W79-00193 3F

GEOCHEMISTRY
The Isotope Hydrology of the Mereenie Sandstone Aquifer, Alice Springs, Northern Territory, Australia,
W79-00322 2F

Hydrogeochemistry of a Calcrete-Containing Aquifer Near Lake Way, Western Australia,
W79-00323 2F

GEOPHYSICS
Summaries of Physical Research in the Geosciences.
W79-00101 10F

GEOTHERMAL STUDIES
Energy Conversion System,
W79-00037 4B

Process and System for Recovery of Energy from Geothermal Brines and Other Water Containing Sources by Direct Contact with a Working Fluid Below the Critical Pressure,
W79-00049 4B

Growth and Diets of Trout from Contrasting Environments in a Geothermally Heated Stream: The Firehole River of Yellowstone National Park,
W79-00082 5C

Summaries of Physical Research in the Geosciences.
W79-00101 10F

Digging for New Sources of Energy.
W79-00175 8B

GOAL PROGRAMMING
Modeling for Organizational Decision-Making: Profits vs. Social Values in Resource Management,
W79-00243 6A

GONYAULAX POLYEDRA
Diel Cycles of Inorganic Nitrogen Uptake in a Natural Phytoplankton Population Dominated by Gonyaulax Polyedra,
W79-00210 5C

GRAPHICAL ANALYSIS
Type-Curve Analysis of Time-Drawdown Data for Partially Penetrating Wells in Unconfined Anisotropic Aquifers,
W79-00136 2F

GRASSES
Vegetative Stabilization of Dredge Spoil in North Florida,
W79-00337 5G

GRAVEL PACKS
Water Well Development Decisions,
W79-00167 8B

GRAVELS
Seepage Control by Particle Size Selection,
W79-00484 4A

GRAVITY WAVES
Comparison of Finite-Element and Finite-Difference Schemes. Part I: One-Dimensional Gravity Wave Motion,
W79-00129 2L

Comparison of Finite-Element and Finite-Difference Schemes. Part II: Two-Dimensional Gravity Wave Motion,
W79-00130 2L

GREAT LAKES
Environmental Management Strategy for the Great Lakes System.
W79-00084 5G

Generation and Propagation of Downwelling Fronts,
W79-00128 2H

Numerical Computation of Three-Dimensional Circulation in Lake Erie: A Comparison of a Free-Surface Model and a Rigid-Lid Model,
W79-00132 2H

The Determination of Quantity and Quality of Great Lakes United States Shoreline Eroded Material,
W79-00249 5B

A First Order Mass Balance Model for the Sources Distribution and Fate of PCBs in the Environment,
W79-00289 5B

Isotopic Composition of Sulfur in Precipitation Within the Great Lakes Basin,
W79-00339 5A

Lake Superior Regulation Effects,
W79-00388 4C

Hydraulics of Great Lakes Inlets,
W79-00469 8B

GREAT LAKES BASIN
Isotopic Composition of Sulfur in Precipitation Within the Great Lakes Basin,
W79-00339 5A

GREAT LAKES REGION
Isotopic Composition of Sulfur in Precipitation Within the Great Lakes Basin,
W79-00339 5A

GREAT PLAINS
Influence of Strip Mines on Regional Ground-Water Flow,
W79-00118 5G

GREAT SALT LAKE
The Historic Level of Great Salt Lake, Utah,
W79-00264 2H

GREAT SALT LAKE (UTAH)
Report of a Dematiaceous Hyphomycete from the Great Salt Lake, Utah,
W79-00297 2H

GREEN ASH
Growth Aspects of Green Ash Seedlings in Years Varying in Moisture (In Russian),
W79-00018 2I

GREEN RIVER BASIN (KY)
Operating Model for the Green River Basin Reservoir System,
W79-00452 4A

GROUNDWATER
Geologic Studies to Identify the Source for High Levels of Radium and Barium in Illinois Ground-Water Supplies: A Preliminary Report,
W79-00003 5A

Electrical-Resistivity Surveys for Groundwater in the Deccan Trap Country of Sangli District, Maharashtra,
W79-00107 4B

Pollution of Groundwater Through Nonlinear Diffusion,
W79-00110 5B

Digital Model Studies of Unsteady-State Radial Flow to Partially Penetrating Wells in Unconfined Anisotropic Aquifers,
W79-00111 2F

Influence of Strip Mines on Regional Ground-Water Flow,
W79-00118 5G

Kriging in the Hydrosciences,
W79-00134 2F

Direct Cooling with Ground Water,
W79-00173 8C

Regional Geology Series: Part VII, The Colorado Plateau,
W79-00177 8B

New Approach Gets Results in Utah Well,
W79-00181 8B

Maps Showing Water-Level Declines, Land Subsidence, and Earth Fissures in South-Central Arizona,
W79-00251 7C

Groundwater Quality Atlas of Nebraska,
W79-00252 7C

Ground-Water Levels in Wyoming, 1977,
W79-00259 7C

Water Resources Data for Pennsylvania, Water Year 1977--Volume 2. Susquehanna and Potomac River Basins.
W79-00265 7C

Water Resources Data for Pennsylvania, Water Year 1977--Volume 1. Delaware River Basin.
W79-00266 7C

Water Resources Data for Wisconsin, Water Year 1977.
W79-00267 7C

Water Resources Data for Pennsylvania, Water Year 1977--Volume 3. Ohio River and St. Lawrence River Basins.
W79-00268 7C

Potentiometric Surface Map of the Floridan Aquifer in the St. Johns River Water Management District and Vicinity, Florida, September, 1977,
W79-00275 7C

Hydrogeochemistry of a Calcrete-Containing Aquifer Near Lake Way, Western Australia,
W79-00323 2F

Formation of a Vermiculite Mineral from Ground Water Components (In Russian),
W79-00382 2K

Hydrogeology of the Grande Prairie Area, Alberta,
W79-00470 2F

GROUNDWATER AVAILABILITY
Ground-Water Availability in the Hitchcock-Red Willow, Frenchman Valley, and Meeker-Driftwood Irrigation Districts, Southwest Nebraska,
W79-00260 4B

Water-Resources Appraisal of the Wet Mountain Valley, in Parts of Custer and Fremont Counties, Colorado,
W79-00274 4B

GROUNDWATER CONTAMINATION
Oil-Troubled Water,
W79-00169 5B

GROUNDWATER MOVEMENT
On the Two-Dimensional Groundwater Movement,
W79-00108 2F

A New Finite Element Technique for the Solution of Two-Phase Flow Through Porous Media,
W79-00135 2F

Oil-Troubled Water,
W79-00169 5B

Relationship of Rainfall and Lake Groundwater Seepage,
W79-00489 5B

GROUNDWATER RESOURCES
Ground-Water Data, 1974-76, Indian Wells Valley, Kern, Inyo, and San Bernardino Counties, California,
W79-00253 7C

Hydrogeologic Reconnaissance of the Mekong Delta in South Vietnam and Cambodia,
W79-00255 7C

Geology and Ground Water in Door County, Wisconsin, with Emphasis on Contamination Potential in the Silurian Dolomite,
W79-00256 5B

Water-Resources Appraisal of the Wet Mountain Valley, in Parts of Custer and Fremont Counties, Colorado,
W79-00274 4B

GROUNDWOOD MILLS
How Kind to the Resources is the Grinding Process. (Hvor ressursvennlig er slipeprosessen),
W79-00408 3E

GROWTH RATE
A Note on Effects of Sewage Effluent Irrigation on Specific Gravity and Growth Rate of White and Red Oaks,
W79-00425 5E

GROWTH RATES
Growth Aspects of Green Ash Seedlings in Years Varying in Moisture (In Russian),
W79-00018 2I

Growth and Diets of Trout from Contrasting Environments in a Geothermally Heated Stream: The Firehole River of Yellowstone National Park,
W79-00082 5C

A Method of Measuring Bacterial Growth in Aquatic Environments Using Dialysis Culture,
W79-00109 5A

GULF OF MEXICO
Inertial Currents Over the Inner Shelf Near 30 Degree N,
W79-00133 2L

GYMNODINIUM
The Toxicity of Phthalates to the Marine Dinoflagellate Gymnodinium Breve,
W79-00063 5C

HABITATS
Rearing of Chinook Salmon in Tributaries of the South Fork Salmon River, Idaho,
W79-00428 8I

HAIL
Hailstone Size inferred from Dents in Cold-Rolled Aluminum Sheet,
W79-00139 7B

HALOPHILES
Report of a Dematiaceous Hyphomycete from the Great Salt Lake, Utah,
W79-00297 2H

HAMILTON MARSHES (NJ)
Growth, Mortality, and Biomass Partitioning in Freshwater Tidal Wetland Populations of Wild Rice (Zizania Aquatica Var. Aquatica),
W79-00214 5C

HARDNESS
Water Hardness and Cardiovascular Mortality,
W79-00171 5C

HATCHERY-REARED ATLANTIC SALMON
Stamina Tunnel Tests on Hatchery-Reared Atlantic Salmon,
W79-00075 8I

HEAT PUMPS
Heat Pump Accessories Can Save You Money,
W79-00174 8C

Housing Project to Utilize Ground Water.
W79-00178 8C

HEAT TRANSFER
Energy Conversion System,
W79-00037 4B

Process and System for Recovery of Energy from Geothermal Brines and Other Water Containing Sources by Direct Contact with a Working Fluid Below the Critical Pressure,
W79-00049 4B

HEAT TREATMENT
Sludge Treatment by Supersonic Jet-Flame,
W79-00403 5E

HEATED WATER
Process and System for Recovery of Energy from Geothermal Brines and Other Water Containing Sources by Direct Contact with a Working Fluid Below the Critical Pressure,
W79-00049 4B

ology of Dreissena Polymorpha (Pall.) reissenidae, Bivalvia) in Lakes Receiving ated Water Discharges,
79-00068 5C

TING
at Pump Accessories Can Save You Money,
79-00174 8C

using Project to Utilize Ground Water.
79-00178 8C

VY METALS
e Effects of Heavy Metals on Algae Popula-ns in a South Central Reservoir,
79-00011 5C

aluation of Donnan Dialysis for the En-nment of Cations,
79-00434 5A

aching Characteristics of Various Heavy tals, Non-Heavy Metals and Anions from nicipal Sewage Sludge Ash,
79-00459 5B

H FLOW
gh-Flow Frequencies for Selected Streams in lahoma,
79-00273 2E

HWAY EFFECTS
mmary of Study Findings, Phase I Report: ological Effects of Highway Construction on Michigan Woodlots and Wetlands,
79-00195 4C

STON
int Source Analysis. Inventory, Water De-nds, and Problem Area Identification. reawide Waste Treatment Plan for the eater Houston Area. Section 208, PL 92-500.
79-00104 6D

AN PATHOLOGY
ological Effects and Environmental Aspects 1,3-Butadiene,
79-00292 5C

IC ACIDS
vestigations of the Molecular Weight, Free dical and Metal Interactions of Isolated uatic and Soil Fulvic Acid,
79-00436 1B

RID RESINS
salination Process Using Thermally generable Resins,
79-00057 3A

RAULIC DESIGN
e Vertical Planar Motion Mechanism; A namic Test Apparatus for Evaluating Cur-t Meters and Other Marine Instrumentation,
79-00224 7B

RAULIC JUMP
ssure Fluctuations Beneath Submerged np,
79-00316 8B

RAULIC MODELS
e Vertical Planar Motion Mechanism; A namic Test Apparatus for Evaluating Cur-t Meters and Other Marine Instrumentation,
79-00224 7B

draulic Model Investigation of a Two-Way op Inlet for Floodwater Retarding Structure . 3, Banklick Creek Watershed, Boone and nton Counties, Kentucky,
79-00341 8B

HYDRAULIC STRUCTURES
Hydraulic Model Investigation of a Two-Way Drop Inlet for Floodwater Retarding Structure No. 3, Banklick Creek Watershed, Boone and Kenton Counties, Kentucky,
W79-00341 8B

HYDRAULICS
Three-Dimensional Open Channel Flow,
W79-00312 8B

Stochastic Processes in Water Resources Engineering.
W79-00380 8B

Hydraulics of Great Lakes Inlets,
W79-00469 8B

HYDROELECTRIC POWER
Water and Land Resource Accomplishments 1975, Statistical Appendix II-Finances and Physical Features.

IRON
Water Treatment: Iron, Boiler Water and Water Analysis.
W79-00176 5F

IRON OXIDES
Hydrolysis of Iron from Acidic Liquors,
W79-00228 5D

IRON REMOVAL
Hydrolysis of Iron from Acidic Liquors,
W79-00228 5D

IRRADIATION
Degradation of Aqueous Phenol Solution by Gamma Irradiation,
W79-00153 5D

The Radiation-Induced Degradation of Lignin in Aqueous Solutions,
W79-00164 5D

IRRIGABLE LAND
Water and Land Resource Accomplishments 1975. Summary Report.
W79-00191 3F

IRRIGATED SOILS
Irrigated Soils of the Milskaya Plain (In Russian),
W79-00060 2G

IRRIGATION
Angularity Sensor Means for Center Pivot Irrigation System,
W79-00023 3F

Flow Reducing Devices Particularly Useful as Drip Emitters for Drip Irrigation,
W79-00031 3F

Two-Step Roll Ahead Irrigation System,
W79-00032 3F

Drip Irrigation System,
W79-00038 3F

Aboveground Sprinkling Device for Sprinkling System,
W79-00059 3F

Correlation Between the Salt Content in the Hard Phase and Soil Solutions of the Murghab Oasis Desert-Meadow Soils of Ancient Irrigation, (In Russian),
W79-00203 2G

Shunt Meters with Segmental Orifices,
W79-00335 3F

Survival and Early Growth of Selected Trees on Waste Water Application Sites,
W79-00422 5E

IRRIGATION DESIGN
Pipe Sizes from Modified Moody Diagram,
W79-00499 3F

IRRIGATION EFFECTS
A Note on Effects of Sewage Effluent Irrigation on Specific Gravity and Growth Rate of White and Red Oaks,
W79-00425 5E

IRRIGATION EFFICIENCY
Angularity Sensor Means for Center Pivot Irrigation System,
W79-00023 3F

Flow Reducing Devices Particularly Useful as Drip Emitters for Drip Irrigation,
W79-00031 3F

Two-Step Roll Ahead Irrigation System,
W79-00032 3F

Drip Irrigation System,
W79-00038 3F

Irrigation Efficiency, A Bibliography, Volume 3.
W79-00307 3F

IRRIGATION PRACTICES
Flow Reducing Devices Particularly Useful as Drip Emitters for Drip Irrigation,
W79-00031 3F

IRRIGATION PROGRAMS
Water and Land Resource Accomplishments 1975. Summary Report.
W79-00191 3F

Water and Land Resource Accomplishments 1975, Statistical Appendix I.
W79-00192 3F

Water and Land Resource Accomplishments 1975, Statistical Appendix II-Finances and Physical Features.

Aboveground Sprinkling Device for Sprinkling System,
W79-00059 3F

ISOTOPE STUDIES
The Isotope Hydrology of the Mereenie Sandstone Aquifer, Alice Springs, Northern Territory, Australia,
W79-00322 2F

JAMAICA
Flood Regions in Jamaica,
W79-00330 2E

JOHNSTOWN AREA
Model of the Flooding Caused by the Failure of the Laurel Run Reservoir Dam, July 19-20, 1977, near Johnstown, Pennsylvania,
W79-00263 2E

JURISDICTION
Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion,
W79-00231 6B

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management: Discussion (Anderson),
W79-00235 6E

Constraints to Welfare Gains Under Extended Jurisdiction Fisheries Management,
W79-00240 6E

KALMAN FILTER
Stream Temperature Estimation Using Kalman Filter,
W79-00121 5B

KARA-KUM CANAL
Overgrowing of the Kara Kum Canal and Some Aftereffects of Introducing the White Amur into Water Bodies, (In Russian),
W79-00207 4A

KENTUCKY
Organized Resistance to an Imposed Environmental Change. A Reservoir in Eastern Kentucky,
W79-00142 6B

Hydraulic Model Investigation of a Two-Way Drop Inlet for Floodwater Retarding Structure No. 3, Banklick Creek Watershed, Boone and Kenton Counties, Kentucky,
W79-00341 8B

Operating Model for the Green River Basin Reservoir System,
W79-00452 4A

KEPONE
Identification of Kepone Alteration Products in Soil and Mullet,
W79-00080 5A

KERN COUNTY
Ground-Water Data, 1974-76, Indian Wells Valley, Kern, Inyo, and San Bernardino Counties, California,
W79-00253 7C

KINETICS
Stormwater Modeling,
W79-00381 5B

KISSIMMEE RIVER BASIN (FLA)
Transport Characteristics of Phosphorus in Channelized and Meandering Streams,
W79-00391 5B

LABORATORY EQUIPMENT
Simple Venturi Device for Mixing Freshwater and Seawater in an Estuarine Culture System,
W79-00071 7B

LABORATORY TESTS
Scour of Bed Material in Very Rough Channels,
W79-00122 2J

Measurements of Bed Load in Oscillatory Flow,
W79-00141 2J

Automated Determination of Selenium in Water,
W79-00261 5A

A Comparison of Ceramic and Teflon in Situ Samplers for Pore Water Determinations,
W79-00325 5A

Hydraulic Model Investigation of a Two-Way Drop Inlet for Floodwater Retarding Structure No. 3, Banklick Creek Watershed, Boone and Kenton Counties, Kentucky,
W79-00341 8B

LAGOON OF ALVARADO (MEX)
Study of the Fishes of the Lagoon of Alvarado, Veracruz, Mexico (In Spanish),
W79-00079 2L

LAGOONS
Study of the Fishes of the Lagoon of Alvarado, Veracruz, Mexico (In Spanish),
W79-00079 2L

Leaching Characteristics of Various Heavy Metals, Non-Heavy Metals and Anions from Municipal Sewage Sludge Ash,
W79-00459 5B

LAKE ALICE (FL)
Waterhyacinth (Eichhornia Crassipes) Nutrient Uptake and Metabolism in a North Central Florida Marsh,
W79-00206 5C

LAKE ERIE
Numerical Computation of Three-Dimensional Circulation in Lake Erie: A Comparison of a Free-Surface Model and a Rigid-Lid Model,
W79-00132 2H

LAKE EVAPORATION
A Simple Model for Shallow Lake Evaporation,
W79-00326 2D

LAKE FAYETTEVILLE (ARK)
The Effects of Heavy Metals on Algae Populations in a South Central Reservoir,
W79-00011 5C

LAKE MANAGEMENT
Lake Level Control and Management--A Case Study,
W79-00390 4A

LAKE MICHIGAN
Is Chrysotile Asbestos Released from Asbestos-Cement Pipe into Drinking Water.,
W79-00013 5A

A First Order Mass Balance Model for the Sources Distribution and Fate of PCBs in the Environment,
W79-00289 5B

LAKE OF ZURICH
On the Vertical Distribution and Seasonal Development of the Density of Dreissena Polymorpha Larvae in the Pelagic Zone of the Lake of Zurich (In German),
W79-00280 5F

LAKE ONTARIO
Generation and Propagation of Downwelling Fronts,
W79-00128 2H

LAKE SUPERIOR
Lake Superior Regulation Effects,
W79-00388 4C

LAKE WASHINGTON (WA)
Seasonal Changes in Respiratory Enzyme Activity and Productivity in Lake Washington Microplankton,
W79-00212 5C

LAKE WATER CHEMISTRY
Arcadia Lake Water-Quality Evaluation,
W79-00463 5C

LAKES
Chemistry of Small Norwegian Lakes, with Special Reference to Acid Precipitation,
W79-00321 5A

A Simple Model for Shallow Lake Evaporation,
W79-00326 2D

Relationship of Rainfall and Lake Groundwater Seepage,
W79-00489 5B

LAND AND WATER CONSERVATION FUND (LWCF)
Federal Outdoor Recreation Land Acquisition-LWCF.
W79-00095 6E

LAND DEVELOPMENT
Federal Outdoor Recreation Land Acquisition-LWCF.
W79-00095 6E

LAND DRAINAGE
Environmental Management Strategy for the Great Lakes System.
W79-00084 5G

LAND MANAGEMENT
Our Reclamation Future: The Missing Bet on Trees,
W79-00086 4C

Federal Outdoor Recreation Land Acquisition-LWCF.
W79-00095 6E

Roles/Functions of Federal, State and Local Public Agencies.
W79-00098 6E

LAND RECLAMATION
Our Reclamation Future: The Missing Bet on Trees,
W79-00086 4C

Water and Land Resource Accomplishments 1975. Summary Report.
W79-00191 3F

Water and Land Resource Accomplishments 1975, Statistical Appendix I.
W79-00192 3F

Remote Monitoring of Coal Strip Mine Rehabilitation,
W79-00226 5G

LAND RESOURCES
Land Prices Substantially Underestimate the Value of Environmental Quality,
W79-00244 6C

LAND SUBSIDENCE
Use of Dummy Variables in Water Resources Studies,
W79-00114 2G

Maps Showing Water-Level Declines, Land Subsidence, and Earth Fissures in South-Central Arizona,
W79-00251 7C

LAND USE
Soil, Water and Air Sciences Research.
W79-00105 2G

The Application of Linear Programming to Run-Off Management,
W79-00393 4A

LAND-USE MODEL
A Model for Evaluating the Effect of Land Uses on Flood Flows,
W79-00450 4C

LANDFILLS
Leaching Characteristics of Various Heavy Metals, Non-Heavy Metals and Anions from Municipal Sewage Sludge Ash,
W79-00459 5B

ANDSAT
Applications of Remote Sensing to Hydrologic Planning,
W79-00099 7B

ANDSAT I IMAGERY
Determination of Terrestrial Albedo from LANDSAT I Satellite Imagery in Photographic Form,
W79-00012 7B

ARVAE
Effect of Environmental Factors on the Distribution of Caddis Fly Larvae in Small Rivers (In Russian),
W79-00147 2I

Control of Aquatic Weed by Moth Larvae,
W79-00197 4A

ARVAL GROWTH STAGES
Collection Bucket for Use with Tow Nets for Larval Fish,
W79-00070 7B

ATERITES
Rural Water Supplies from Laterite Runoff,
W79-00387 5F

AUREL RUN RESERVOIR DAM
Model of the Flooding Caused by the Failure of the Laurel Run Reservoir Dam, July 19-20, 1977, near Johnstown, Pennsylvania,
W79-00263 2E

AW ENFORCEMENT
A Socio-Economic Approach to Water Pollution Law Enforcement in England and Wales,
W79-00245 5G

EACHATE
Adsorption of Some Toxic Substances by Waste Components,
W79-00152 5B

Sampling and Modeling of Non-Point Sources at a Coal-Fired Utility,
W79-00279 5B

EACHATES
Sorption Capabilities of Various Materials for Leachate Treatment,
W79-00377 5D

EACHING
A Lysimetric Study of Waters in an Irrigated Pasture (In Russian),
W79-00284 2G

Leaching Characteristics of Various Heavy Metals, Non-Heavy Metals and Anions from Municipal Sewage Sludge Ash,
W79-00459 5B

EACHING CHARACTERISTICS
Leaching Characteristics of Various Heavy Metals, Non-Heavy Metals and Anions from Municipal Sewage Sludge Ash,
W79-00459 5B

EAD
Environmental Effects of Schuylkill Oil Spill I, June 1972.
W79-00294 5C

EGISLATION
Roles/Functions of Federal, State and Local Public Agencies.
W79-00098 6E

Water Administration in England and Wales Impacts of Reorganization,
W79-00384 6E

Looking at the Positive Side of Energy Regulation,
W79-00411 3E

LETHAL LIMIT
Development of a Manometric Fish Bioassay Technique for Water Pollution,
W79-00008 5A

LIABILITY
Property Rules, Liability Rules, and Environmental Economics,
W79-00241 6E

LIGNINS
The Radiation-Induced Degradation of Lignin in Aqueous Solutions,
W79-00164 5D

Use of Hydrolysis Lignin for Purification of Effluents from Ammonia Production and the Preparation of Complex Fertilizers (Primenenie gidroliznogo lignina dlya ochistki stochnykh vod ammiachnogo proizvodstva i polucheniya slozhnykh udobrenii),
W79-00402 5D

LIMITING FACTORS
Effects of N:P Atomic Ratios and Nitrate Limitation on Algal Growth, Cell Composition, and Nitrate Uptake,
W79-00211 5C

Morphometric Changes in Asterionella Formosa Colonies Under Phosphate and Silicate Limitation,
W79-00215 5C

Continuous Culture of Marine Diatoms Under Silicon Limitation. 3. A Model of Si-Limited Diatom Growth,
W79-00229 5C

LINEAR FLOW MODEL
Water/Energy Management and Evaluation Model for Pennsylvania,
W79-00007 6D

A Mathematical Model for Simulating Water Demand-Supply and Energy Uses for the State of Pennsylvania,
W79-00442 8A

LINEAR PROGRAMMING
The Application of Linear Programming to Run-Off Management,
W79-00393 4A

LININGS
Seepage Control by Particle Size Selection,
W79-00484 4A

LIQUID WASTES
Transpiration and Evaporation of Sewage Effluent,
W79-00088 5D

Treatment of Liquid Wastes from Fossil Fuel Power Plants,
W79-00355 5D

LITTLE PORT WALTER (ALA)
Simple Venturi Device for Mixing Freshwater and Seawater in an Estuarine Culture System,
W79-00071 7B

LOAM
Field Observations of the Moisture Regime of a Yellow-Grey Earth (Otokia Silt Loam) in Eastern Otago,
W79-00310 2G

LOCAL GOVERNMENT
Roles/Functions of Federal, State and Local Public Agencies.
W79-00098 6E

LOTIC ENVIRONMENT
Diversity and Environments of Benthic Invertebrate Communities in South Swedish Streams,
W79-00209 5C

LOUISIANA
Inertial Currents Over the Inner Shelf Near 30 Degree N,
W79-00133 2L

LOW FLOW
Low-Flow Characteristics of Oklahoma Streams,
W79-00257 2E

Low-Flow Characteristics of Streams on the Olympic Peninsula, Washington,
W79-00258 2E

LUMBERING
Grazing and Logging Effects on Soil Surface Changes in Central Colorado's Ponderosa Pine Type,
W79-00140 4C

Changes in Water Regime of Brown Forest Soils of the Georgian SSR Under the Effect of Silvicultural Practices, (In Russian),
W79-00401 4C

LYSIMETER STUDIES
Leaching Characteristics of Various Heavy Metals, Non-Heavy Metals and Anions from Municipal Sewage Sludge Ash,
W79-00459 5B

LYSIMETRY
A Lysimetric Study of Waters in an Irrigated Pasture (In Russian),
W79-00284 2G

MACROPHYTES
An Investigation of Primary Production and Ecosystem Metabolism in a Lake Michigan Dune Pond,
W79-00205 5C

MAGNESIUM
Flame-Photometric Method for the Determination of Magnesium in Spent Liquors of Sulfite Pulp Mills (Plamennofotometricheskii method opredeleniya magniya v shchelokakh sul'fitnotsellyuloznogo proizvodstva),
W79-00415 5A

MAINTENANCE COSTS
Water and Land Resource Accomplishments 1975, Statistical Appendix III--Project Data.
W79-00194 3F

MANAGEMENT
Management Plan for Control and Treatment of Toxic Substances,
W79-00346 5G

An Analysis of Criticisms of International Fishery Organizations with Reference to Three Agencies Associated with the Canadian West Coast Fishery,
W79-00394 6E

MANGANESE
Water Treatment: Iron, Boiler Water and Water Analysis.
W79-00176 5F

MANGROVE SWAMPS
The Photosynthetic and Respiratory Rates and Tolerances of Benthic Algae from a Mangrove and Salt Marsh Estuary: A Comparative Study,
W79-00204 5C

MAPPING
Remote Monitoring of Coal Strip Mine Rehabilitation,
W79-00226 5G

Methodical Problems in the Evaluation and Mapping of Erosion-Endangered Lands (In Russian),
W79-00462 2J

MAPS
Groundwater Quality Atlas of Nebraska,
W79-00252 7C

Potentiometric Surface Map of the Floridan Aquifer in the St. Johns River Water Management District and Vicinity, Florida, September, 1977,
W79-00275 7C

MARINE MICROORGANISMS
Studies in Microbial Chemotactic Behavior in Seawater,
W79-00293 5C

MARSHES
Waterhyacinth (Eichhornia Crassipes) Nutrient Uptake and Metabolism in a North Central Florida Marsh,
W79-00206 5C

MASS TRANSFER
Transfer of Gases at Natural Air-Water Interfaces,
W79-00127 2L

MATERIALS
Water Relations of Fritted Clays,
W79-00476 2G

MATHEMATICAL MODELS
WASOPT Users Manual: An Integer Programming Methodology for Municipal/Regional Water Supply Planning,
W79-00002 6A

On the Two-Dimensional Groundwater Movement,
W79-00108 2F

Comparison of Finite-Element and Finite-Difference Schemes. Part I: One-Dimensional Gravity Wave Motion,
W79-00129 2L

Comparison of Finite-Element and Finite-Difference Schemes. Part II: Two-Dimensional Gravity Wave Motion,
W79-00130 2L

Kriging in the Hydrosciences,
W79-00134 2F

Model of the Flooding Caused by the Failure of the Laurel Run Reservoir Dam, July 19-20, 1977, near Johnstown, Pennsylvania,
W79-00263 2E

Sampling and Modeling of Non-Point Sources at a Coal-Fired Utility,
W79-00279 5B

A First Order Mass Balance Model for the Sources Distribution and Fate of PCBs in the Environment,
W79-00289 5B

Computing Two-Dimensional Dam-Break Flood Waves,
W79-00313 8A

Dynamics and Control of Suspended Solids in a Two-Step Activated Sludge Plant,
W79-00352 5D

Application of Ion Exchange/Adsorption Models to Virus Transport in Percolating Beds,
W79-00353 5D

Modelling the Water Quality of the Hydrological Cycle.
W79-00379 5B

Lake Superior Regulation Effects,
W79-00388 4C

Transport Characteristics of Phosphorus in Channelized and Meandering Streams,
W79-00391 5B

Arcadia Lake Water-Quality Evaluation,
W79-00463 5C

Steady Infiltration from Single and Periodic Strip Sources,
W79-00471 2G

Simple Model for Ocean Outfall Plumes,
W79-00479 5B

Potential and Limitations of Rainfall-Runoff Models for Prediction on Ungauged Catchments: A Case Study from the Papua New Guinea Highlands,
W79-00491 2A

Climate Change: Detection and Its Impact on Hydrologic Design,
W79-00492 2E

Free-Surface Seepage Problem,
W79-00496 8D

MAYFLIES
Adaptations and Resistance to Anoxia in Cloeon Dipterum (Ephemeroptera) and Nemoura Cinerea (Plecoptera),
W79-00076 5G

MEADOWS
Wet Meadows in Southern Sweden: Vegetation, Succession and Management (In Swedish),
W79-00288 2I

MEANDERING STREAMS
Transport Characteristics of Phosphorus in Channelized and Meandering Streams,
W79-00391 5B

MEASUREMENT
A Novel Method of Estimating the Discharge of Water from Mound Springs of the Great Artesian Basin, Central Australia,
W79-00112 2F

Hailstone Size inferred from Dents in Cold-Rolled Aluminum Sheet,
W79-00139 7B

MEKONG DELTA
Hydrogeologic Reconnaissance of the Mekong Delta in South Vietnam and Cambodia,
W79-00255 7C

MEMBRANE ADSORPTION PROCEDURE
Membrane Concentration of Infectious Bovine Rhinotracheitis Virus from Water,
W79-00148 5C

MEMBRANE PROCESSES
Uptake of Americum-241 by Algae and Bacteria,
W79-00067 5B

Membrane Concentration of Infectious Bovine Rhinotracheitis Virus from Water,
W79-00148 5C

Laboratory Studies on Advanced Composite H F Modules for Seawater Reverse Osmosis,
W79-00300 3A

Increased Product Water Recovery by Reverse Osmosis Using Interstage Ion Exchange Softing and a Spiractor,
W79-00301 3A

Final Report on Field Test Evaluation and Operation and Maintenance of Seawater Reverse Osmosis and Electrodialysis Pilot Plants at Wrightsville Beach Test Facility, November 1976,
W79-00302 3A

High Temperature Elctrodialysis-Phase VI,
W79-00303 3A

Development of Low Cost Membrane Cleaning Agents,
W79-00304 3A

Molecular Fractionation by Staged Ultrafiltration,
W79-00367 5D

MEMBRANES
Electric Resistance of the Cation-Selective MK-40 Membrane During Electrodialysis of Spend Sulfite Liquor (Elektrosoprotivlenie kationoselektivnoy membrany MK-40 pri elektrodialze otrabotannogo sul'fitnogo shcheloka),
W79-00417 5A

MERCURY
The Source of American Falls Reservoir Pollutants,
W79-00004 5B

Process for Removing Mercury and Mercury Salts from Liquid Effluents,
W79-00056 5D

Multimedia Levels--Mercury,
W79-00291 5B

METABOLISM
An Investigation of Primary Production and Ecosystem Metabolism in a Lake Michigan Dune Pond,
W79-00205 5C

Waterhyacinth (Eichhornia Crassipes) Nutrient Uptake and Metabolism in a North Central Florida Marsh,
W79-00206 5C

Photosynthesis and Carbon Metabolism in Marine and Freshwater Diatoms,
W79-00208 5C

METHOD OF CHARACTERISTICS
Computing Two-Dimensional Dam-Break Flood Waves,
W79-00313 8A

METHODOLOGY
WASOPT Users Manual: An Integer Programming Methodology for Municipal/Regional Water Supply Planning,
W79-00002 6A

Stamina Tunnel Tests on Hatchery-Reared Atlantic Salmon,
W79-00075 8I

On the Environmental Efficiency of Economic Systems,
W79-00230 6G

Conceptual and Statistical Issues in Developing Environmental Measures - Recent U.S. Experience,
W79-00232 6G

Methodical Problems in the Evaluation and Mapping of Erosion-Endangered Lands (In Russian),
W79-00462 2J

ETOROLOGY
A Technique for Estimating Clock Two-Hourly Precipitation Rate Distributions,
W79-00089 2B

EXICAN WATER TREATY
Reject Stream Replacement Study.
W79-00092 3A

EXICO
Study of the Fishes of the Lagoon of Alvarado, Veracruz, Mexico (In Spanish),
W79-00079 2L

CROBIAL DEGRADATION
Method for Depolluting Fresh and Sea Water from Petroleum Products,
W79-00058 5G

Microbial Degradation of DDT,
W79-00278 5C

CROCYSTIS AERUGINOSA
Overgrowing of the Kara Kum Canal and Some Aftereffects of Introducing the White Amur into Water Bodies, (In Russian),
W79-00207 4A

LITARY RESERVATIONS
Wetlands as a Naval Environmental Concern,
W79-00201 6G

LSKAYA PLAIN (USSR)
rrigated Soils of the Milskaya Plain (In Russian),
W79-00060 2G

NE WASTES
ish and Wildlife Inventory of the Seven-County Region Included in the Central Florida hosphate Industry Area-Wide Environmental mpact Study. Volumes I and II,
W79-00100 5C

quatic Inhabitants of a Mine Waste Stream in rizona,
W79-00426 5C

ydrochemical Influences on the Fishery ithin the Phosphate Mining Area of Eastern aho,
W79-00427 5C

IMAL SPANNING TREE
ortest Path Problems in Hydrogeology,
W79-00137 6A

SISSIPPI
anges in Interstitial Water Salinity of a Mississippi Tidal Marsh,
W79-00338 2L

MISSOURI RIVER
Yellowstone National Park Survey May-August 1970, Includes Soda Butte Survey, May-October 1969.
W79-00250 5A

MIXING
Mixing in an Arctic Fjord,
W79-00487 2L

MIXING ZONES
The Effect of Reduced Wetlands and Storage Basins on the Size, Stability and Productivity of the Watershed Mixing Zone,
W79-00441 2L

MODEL STUDIES
Nutrient Loading/Lake Trophic Condition Relationships with Special Reference to the Influence of Flushing Rate,
W79-00001 5C

Water/Energy Management and Evaluation Model for Pennsylvania,
W79-00007 6D

On the Two-Dimensional Groundwater Movement,
W79-00108 2F

Digital Model Studies of Unsteady-State Radial Flow to Partially Penetrating Wells in Unconfined Anisotropic Aquifers,
W79-00111 2F

Influence of Strip Mines on Regional Ground-Water Flow,
W79-00118 5G

Stream Temperature Estimation Using Kalman Filter,
W79-00121 5B

Transfer of Gases at Natural Air-Water Interfaces,
W79-00127 2L

Generation and Propagation of Downwelling Fronts,
W79-00128 2H

Comparison of Finite-Element and Finite-Difference Schemes. Part I: One-Dimensional Gravity Wave Motion,
W79-00129 2L

Comparison of Finite-Element and Finite-Difference Schemes. Part II: Two-Dimensional Gravity Wave Motion,
W79-00130 2L

On Geostrophic Adjustment in Sea Straits and Wide Estuaries. Part I: One-Layer System,
W79-00131 2L

Numerical Computation of Three-Dimensional Circulation in Lake Erie: A Comparison of a Free-Surface Model and a Rigid-Lid Model,
W79-00132 2H

Kriging in the Hydrosciences,
W79-00134 2F

A New Finite Element Technique for the Solution of Two-Phase Flow Through Porous Media,
W79-00135 2F

Continuous Culture of Marine Diatoms Under Silicon Limitation. 3. A Model of Si-Limited Diatom Growth,
W79-00229 5C

Modeling for Organizational Decision-Making: Profits vs. Social Values in Resource Management,
W79-00243 6A

Model of the Flooding Caused by the Failure of the Laurel Run Reservoir Dam, July 19-20, 1977, near Johnstown, Pennsylvania,
W79-00263 2E

A Simple Model for Shallow Lake Evaporation,
W79-00326 2D

Simulation of Flows in Ungaged Basins,
W79-00331 2E

Mass Balance Model for Calculation of Ionic Input Loads in Atmospheric Fallout and Discharge from a Mountainous Basin,
W79-00332 5B

Modeling and Monitoring of Toxic Spills and Toxic Effluents,
W79-00343 5B

Dynamics and Control of Suspended Solids in a Two-Step Activated Sludge Plant,
W79-00352 5D

Stormwater Modeling,
W79-00381 5B

Optimal Solution to the Timing, Sequencing, and Sizing of Multiple Reservoir Surface Water Supply Facilities When Demand Depends on Price,
W79-00438 6A

A Model for Evaluating the Effect of Land Uses on Flood Flows,
W79-00450 4C

Using Ice as Water-Impermeable Element in Rockfill Dams,
W79-00466 8D

Simulation of Cold Cloud Precipitation in a Three Dimensional Mesoscale Model,
W79-00468 2B

A Soil Moisture Budget Model Accounting for Shallow Water Table Influences,
W79-00473 2G

River Temperature Variation with Freezing and Storage,
W79-00477 2E

Total Phosphorus Transport During Storm Events,
W79-00478 5B

Control of Water Residence Time in Small Reservoirs,
W79-00482 4A

Vortex Formation at Vertical Pipe Intakes,
W79-00485 8B

Potential and Limitations of Rainfall-Runoff Models for Prediction on Ungauged Catchments: A Case Study from the Papua New Guinea Highlands,
W79-00491 2A

Climate Change: Detection and Its Impact on Hydrologic Design,
W79-00492 2E

Continuous Simulation of Nonpoint Pollution,
W79-00493 5B

MODEL STUDIES

Free-Surface Seepage Problem,
W79-00496 8D

On Geostrophic Adjustment in Sea Straits and Wide Estuaries: Theory and Laboratory Experiments. Part II - Two-Layer System,
W79-00497 2L

MOISTURE
Growth Aspects of Green Ash Seedlings in Years Varying in Moisture (In Russian),
W79-00018 2I

MOISTURE AVAILABILITY
Water Relations and Physiological Activity of Potatoes,
W79-00017 2I

MOISTURE BLOCKS
Field Observations of the Moisture Regime of a Yellow-Grey Earth (Otokia Silt Loam) in Eastern Otago,
W79-00310 2G

MOISTURE DEFICIT
Changes in Water Regime of Brown Forest Soils of the Georgian SSR Under the Effect of Silvicultural Practices, (In Russian),
W79-00401 4C

MOISTURE STRESS
Stomatal and Nonstomatal Regulation of Water Use in Cotton, Corn and Sorghum,
W79-00016 2I

Water Relations and Physiological Activity of Potatoes,
W79-00017 2I

MOLECULAR FRACTIONATION
Molecular Fractionation by Staged Ultrafiltration,
W79-00367 5D

MOLECULAR WEIGHT
Investigations of the Molecular Weight, Free Radical and Metal Interactions of Isolated Aquatic and Soil Fulvic Acid,
W79-00436 1B

MOLLUSKS
Ecology of Dreissena Polymorpha (Pall.) (Dreissenidae, Bivalvia) in Lakes Receiving Heated Water Discharges,
W79-00068 5C

MOLTING
Toxicity of Sodium Pentachlorophenate (NA-PCP) to the Grass Shrimp, Palaemonetes Pugio, at Different Stages of the Molt Cycle,
W79-00078 5C

MOMENTUM
Momentum Transfer in a Compound Channel,
W79-00334 8B

MONITORING
Aquatic Biotal Monitor,
W79-00033 5A

Remote Water Monitoring System,
W79-00047 7B

Automatic System Cleaner for Remote Monitor,
W79-00051 5A

Collection Bucket for Use with Tow Nets for Larval Fish,
W79-00070 7B

Modeling and Monitoring of Toxic Spills and Toxic Effluents,
W79-00343 5B

MOODY RESISTANCE DIAGRAM
Pipe Sizes from Modified Moody Diagram,
W79-00499 3F

MORTALITY
Acute and Chronic Oral Toxicity of Chlroinated Dibenzofurans to Salmonid Fishes,
W79-00062 5C

The Effect of Naphthalene on Survival and Activity of the Amphipod Parhyale,
W79-00081 5C

MOUND SPRINGS
A Novel Method of Estimating the Discharge of Water from Mound Springs of the Great Artesian Basin, Central Australia,
W79-00112 2F

MOUNTAINS
Longitudinal Dispersion of Fluid Particles in Mountain Streams: I. Theory and Field Evidence,
W79-00308 5B

Longitudinal Dispersion of Fluid Particles in Mountain Streams: 2. Similarity of the Mean Motion and Its Application,
W79-00309 5B

Origin and Transport of Large Boulders in Mountain Streams,
W79-00490 2J

MULLETS
Identification of Kepone Alteration Products in Soil and Mullet,
W79-00080 5A

MULTIMEDIA DEEP BED FILTRATION (MMDB)
New Developments in Oil Interception by Filtration,
W79-00364 5D

MULTIPLE PURPOSE
Modeling for Organizational Decision-Making: Profits vs. Social Values in Resource Management,
W79-00243 6A

MULTIPLE-PURPOSE RESERVOIRS
Optimal Operation of Shelbyville and Carlyle Lakes,
W79-00392 4A

MUNICIPAL SEWAGE SLUDGE INCINERATOR ASH
Leaching Characteristics of Various Heavy Metals, Non-Heavy Metals and Anions from Municipal Sewage Sludge Ash,
W79-00459 5B

MUNICIPAL SEWAGE TREATMENT
Resource Analysis: Water and Energy as Linked Resources,
W79-00453 6D

MUNICIPAL WASTE
Instrumentation and Controls for Philadelphia Electric Company Eddystone Generating Station Wastewater Treatment System,
W79-00357 5D

MUNICIPAL WASTES
Characterization of Performance of Full-Scale Tertiary Wastewater Granular Media Filters,
W79-00371 5D

Leaching Characteristics of Various Heavy Metals, Non-Heavy Metals and Anions from Municipal Sewage Sludge Ash,
W79-00459 5B

MUNICIPAL WATER
Water and Land Resource Accomplishments 1975, Statistical Appendix II-Finances and Physical Features.
W79-00193 3F

Resource Analysis: Water and Energy as Linked Resources,
W79-00453 6D

MUSSELS
On the Vertical Distribution and Seasona Development of the Density of Dreissena Polymorpha Larvae in the Pelagic Zone of the Lake of Zurich (In German),
W79-00280 5I

MUTAGENS
Preliminary Study of Selected Potential En vironmental Contaminants - Optica Brighteners, Methyl Chloroform, Tri Chloroethylene, Tetrachloroethylene and ion Exchange Resins,
W79-00283 5A

NAPHTHALENES
The Effect of Naphthalene on Survival and Ac tivity of the Amphipod Parhyale,
W79-00081 5C

NATIONAL PARKS
Water Quality in the Ozark National Scenic Riverways, Missouri,
W79-00254 5I

NATIONAL WATER COMMISSION
The National Water Commission Revisited Per spective on National Water Policy Studies with some Implications for Changes in Futur Water Policy,
W79-00383 6I

NATURAL RESOURCE ECONOMICS
Natural Resource Economics: The Upsettin Discipline,
W79-00242 6I

NATURAL RESOURCES
Soil, Water and Air Sciences Research.
W79-00105 2C

NATURAL STREAMS
Momentum Transfer in a Compound Channel,
W79-00334 8I

NEBRASKA
Groundwater Quality Atlas of Nebraska,
W79-00252 7C

Ground-Water Availability in the Hitchcock Red Willow, Frenchman Valley, and Meeker Driftwood Irrigation Districts, Southwes Nebraska,
W79-00260 4I

NEUTRALIZATION
Sea-Water Neutralization of Effluents from th Industrial Processing of Phosphorite. A Cas Study in the Practical Use of Basic Knowledg in Analytical and Marine Chemistry,
W79-00151 5C

NEW ENGLAND
The Feasibility of Using Forest Lands fo Recycling Sludge Nutrients in Northern Nev England,
W79-00446 5I

NEW HAMPSHIRE
The Feasibility of Using Forest Lands fo Recycling Sludge Nutrients in Northern Nev England,
W79-00446 5I

EW ZEALAND
Field Observations of the Moisture Regime of a Yellow-Grey Earth (Otokia Silt Loam) in Eastern Otago,
W79-00310 2G

EWTS
The Toxicity of Manganese Ethylenebisdithiocarbamate to the Adult Newt, Triturus Cristatus,
W79-00064 5C

ICKEL
Controls Drive Platers to Materials Recovery,
W79-00154 5D

IGERIA
Rural Water Supplies from Laterite Runoff,
W79-00387 5F

TRATE NITROGEN FLUX
Influence of Nitrogen Fertilization on the Quality and Quantity of Streamflow from a Forested Watershed,
W79-00448 5B

TRATE REDUCTASE
Nitrate Reductase Activity of Soybeans in Relation to other Indicators of Water Stress,
W79-00149 2I

TRATES
Diel Cycles of Inorganic Nitrogen Uptake in a Natural Phytoplankton Population Dominated by Gonyaulax Polyedra,
W79-00210 5C

Effects of N:P Atomic Ratios and Nitrate Limitation on Algal Growth, Cell Composition, and Nitrate Uptake,
W79-00211 5C

Profile Accumulation of Fertilizer-Derived Nitrate and Total Nitrogen Recovery in Two Long-Term Nitrogen-Rate Experiments with Corn,
W79-00500 2G

TRIFICATION
Distribution of Heterotrophic and Nitrifying Bacteria Within the Aerobic-Media Trickling Filter,
W79-00433 5D

Aerobic Media Trickling Filter Applied to Nitrogen Control,
W79-00445 5D

TRITES
Denitrifying Bacteria Can be Enumerated in Nitrite Broth,
W79-00498 2G

TROGEN
Effects of N:P Atomic Ratios and Nitrate Limitation on Algal Growth, Cell Composition, and Nitrate Uptake,
W79-00211 5C

N-POINT POLLUTION SOURCES
The Source of American Falls Reservoir Pollutants,
W79-00004 5B

NAGRICULTURAL LANDS
Water and Land Resource Accomplishments 1975, Statistical Appendix II-Finances and Physical Features.
W79-00193 3F

NPOINT POLLUTION
Continuous Simulation of Nonpoint Pollution,
W79-00493 5B

NORTH CAROLINA
Nature and Impact of Rural Stream Inputs on Water Quality,
W79-00483 5C

NUCLEAR WASTES
Transuranic Nuclides in Plaice (Pleuronectes Platessa) from the North-Eastern Irish Sea,
W79-00077 5B

NUMERICAL ANALYSIS
Numerical Study of Continuous Saltation,
W79-00314 8B

NUTRIENT CYCLING
Influence of Nitrogen Fertilization on the Quality and Quantity of Streamflow from a Forested Watershed,
W79-00448 5B

NUTRIENT LOADING
Nutrient Loading/Lake Trophic Condition Relationships with Special Reference to the Influence of Flushing Rate,
W79-00001 5C

NUTRIENT REMOVAL
Waterhyacinth (Eichhornia Crassipes) Nutrient Uptake and Metabolism in a North Central Florida Marsh,
W79-00206 5C

NUTRIENT REQUIREMENTS
Nutrition and Growth of the Bighead Aristichthys Nobilis (Rich.) In Bodies of Water of the Dagestan ASSR,
W79-00320 2H

NUTRIENTS
Waterhyacinth (Eichhornia Crassipes) Nutrient Uptake and Metabolism in a North Central Florida Marsh,
W79-00206 5C

A Lysimetric Study of Waters in an Irrigated Pasture (In Russian),
W79-00284 2G

Transport Characteristics of Phosphorus in Channelized and Meandering Streams,
W79-00391 5B

Arcadia Lake Water-Quality Evaluation,
W79-00463 5C

OAK TREES
A Note on Effects of Sewage Effluent Irrigation on Specific Gravity and Growth Rate of White and Red Oaks,
W79-00425 5E

OBSERVATION WELLS
Ground-Water Levels in Wyoming, 1977,
W79-00259 7C

OCEANS
Optical Classification of Natural Waters,
W79-00318 2L

Simple Model for Ocean Outfall Plumes,
W79-00479 5B

ODOR
Water -- 1977.
W79-00342 5D

Wastewater Odor Problem Solving -- Process Modification Versus Air Treatment,
W79-00373 5D

Control of Nuisance Odors from Ponds by the Use of Bacteria Cultures,
W79-00374 5D

OGALLAL FORMATION
Ground-Water Availability in the Hitchcock-Red Willow, Frenchman Valley, and Meeker-Driftwood Irrigation Districts, Southwest Nebraska,
W79-00260 4B

OHIO
Determination of Spoil-Bank Erosion Rates in Ohio by Using Interbank Sediment Accumulations,
W79-00495 2J

OHIO RIVER BASIN
Water Resources Data for Pennsylvania, Water Year 1977--Volume 3. Ohio River and St. Lawrence River Basins.
W79-00268 7C

OIL
The Effect of Naphthalene on Survival and Activity of the Amphipod Parhyale,
W79-00081 5C

Environmental Effects of Schuylkill Oil Spill II, June 1972.
W79-00294 5C

OIL INDUSTRY
The Effect of Cyclohexane Derivatives on Selection of Bacterial Groups Forming Activated Sludge Microflora,
W79-00159 5D

Controlling and Monitoring Activated-Sludge Units,
W79-00160 5D

OIL POLLUTION
Method of Disposing of Waste Water Containing Emulsified Oil,
W79-00020 5D

Oil Fence,
W79-00036 5G

Belt Type Oil Removal Unit,
W79-00040 5G

Process and Apparatus for Separating Oil From Water Contaminated with Oil,
W79-00050 5G

Method for Depolluting Fresh and Sea Water from Petroleum Products,
W79-00058 5G

No Water-Source Damage Found in Oil States.
W79-00172 5G

Environmental Effects of Schuylkill Oil Spill II, June 1972.
W79-00294 5C

OIL RESERVOIRS
Water Analytical Data as a Tool in Drilling and Production Economics,
W79-00168 8G

OIL SPILLS
Apparatus for Deploying and Taking Up an Oil Fence,
W79-00048 5G

Oil-Troubled Water,
W79-00169 5B

Environmental Effects of Schuylkill Oil Spill II, June 1972.
W79-00294 5C

OIL WASTES
Oil/Water Separation Technology: The Options Available - Part 2,
W79-00158 5G

The Effect of Cyclohexane Derivatives on Selection of Bacterial Groups Forming Activated Sludge Microflora,
W79-00159 5D

Controlling and Monitoring Activated-Sludge Units,
W79-00160 5D

OILY WASTE
New Developments in Oil Interception by Filtration,
W79-00364 5D

OILY WASTES
Factors Influencing Induced Air Flotation,
W79-00375 5D

OILY WATER
Removal of Ammonium Sulfide from Wastewater by Liquid Membrane Process,
W79-00161 5D

OKLAHOMA
Low-Flow Characteristics of Oklahoma Streams,
W79-00257 2E

High-Flow Frequencies for Selected Streams in Oklahoma,
W79-00273 2E

OLIGOTRAPHY
A Periphytic Microflora Analysis of the Colorado River and Major Tributaries in Grand Canyon and Vicinity,
W79-00285 5A

OLYMPIC PENINSULA (WASH)
Low-Flow Characteristics of Streams on the Olympic Peninsula, Washington,
W79-00258 2E

ON-SITE DATA COLLECTIONS
Field Observations of the Moisture Regime of a Yellow-Grey Earth (Otokia Silt Loam) in Eastern Otago,
W79-00310 2G

ON-SITE INVESTIGATIONS
Aquatic Biotal Monitor,
W79-00033 5A

Quantitative Comparison of Seining and Underwater Observation for Stream Fishery Surveys,
W79-00072 7B

Artificial Substrate Sampler for Benthic Invertebrates in Ponds, Small Lakes, and Reservoirs,
W79-00074 7B

A Field Evaluation of Subsurface and Surface Runoff, II. Runoff Processes,
W79-00116 2E

Field Investigation of Selective Withdrawal,
W79-00119 4A

Changes in Interstitial Water Salinity of a Mississippi Tidal Marsh,
W79-00338 2L

ON-SITE LABORATORIES
Ion Selective Electrodes in Water Quality Analysis,
W79-00223 5A

OPEN CHANNEL FLOW
Three-Dimensional Open Channel Flow,
W79-00312 8B

OPEN CHANNELS
Three-Dimensional Open Channel Flow,
W79-00312 8B

OPERATING COSTS
Water and Land Resource Accomplishments 1975, Statistical Appendix III--Project Data.
W79-00194 3F

OPERATING RULES
Optimal Operation of Shelbyville and Carlyle Lakes,
W79-00392 4A

OPTICAL BRIGHTENERS
Preliminary Study of Selected Potential Environmental Contaminants - Optical Brighteners, Methyl Chloroform, Tri-Chloroethylene, Tetrachloroethylene and ion Exchange Resins,
W79-00283 5A

OPTICAL PROPERTIES
The Radiation-Induced Degradation of Lignin in Aqueous Solutions,
W79-00164 5D

Optical Classification of Natural Waters,
W79-00318 2L

OPTIMIZATION
Water/Energy Management and Evaluation Model for Pennsylvania,
W79-00007 6D

Shortest Path Problems in Hydrogeology,
W79-00137 6A

The Optimal Pricing of Undepletable Externalities,
W79-00239 6C

Modelling the Water Quality of the Hydrological Cycle.
W79-00379 5B

Optimal Operation of Shelbyville and Carlyle Lakes,
W79-00392 4A

Dynamic Programming and the Principle of Optimality: A Systematic Approach,
W79-00396 6A

OPTIMUM DEVELOPMENT PLANS
Optimal Solution to the Timing, Sequencing, and Sizing of Multiple Reservoir Surface Water Supply Facilities When Demand Depends on Price,
W79-00438 6A

ORGANIC LOADING
Controlling and Monitoring Activated-Sludge Units,
W79-00160 5D

ORGANIC MATTER
Phytoplankton Extracellular Release and Its Relation to the Seasonal Cycle of Dissolved Organic Carbon in a Eutrophic Lake,
W79-00213 5C

ORGANIC WASTES
What's in the Water, A Look at the Proposed EPA Regulations for Organic Chemicals in Public Water Supplies,
W79-00179 5F

Designing and Operating an Oxygen Activate Sludge System Including Tertiary Alum-Mu Precipitation,
W79-00350 5

ORTHOPHOSPHATE
Transport Characteristics of Phosphorus i Channelized and Meandering Streams,
W79-00391 5

OUTFALL PLUMES
Simple Model for Ocean Outfall Plumes,
W79-00479 5

OUTFALL SEWERS
Simple Model for Ocean Outfall Plumes,
W79-00479 5

OVERDRAFT
Maps Showing Water-Level Declines, Lan Subsidence, and Earth Fissures in South-Ce tral Arizona,
W79-00251 7

OXIDATION
Biological Oxidation and Flotation Apparatu and Method,
W79-00030 5

Pretreatment of Industrial Wastes with Ozone
W79-00368 5

OXYGEN
Effects of Feeding and of Chemical Stimulatio on the Oxygen Uptake of Nassarius Reticulatu (Gastropoda: Prosobranchia),
W79-00083 5

Effects of Dissolved Oxygen in the Oxygen tion Activated Sludge Process,
W79-00351 5

OXYGEN CONSUMPTION (CARP)
Survival and Oxygen Consumption of Youn Kura Carp Under Various Keeping Condition (In Russian),
W79-00180 2

OXYGEN REQUIREMENTS
Adaptations and Resistance to Anoxia i Cloeon Dipterum (Ephemeroptera) and Nemou ra Cinerea (Plecoptera),
W79-00076 5

OXYGENATION
Degradation of Aqueous Phenol Solution b Gamma Irradiation,
W79-00153 5

The UNOX Process: Effective Wastewate Treatment Practice,
W79-00347 5

Comparison of Complete Mixed Activate Sludge and UNOX Treatment of Brewer Wastes,
W79-00348 5

Effects of Dissolved Oxygen in the Oxygena tion Activated Sludge Process,
W79-00351 5

Oxygen Activated Sludge Considerations fo Industrial Applications,
W79-00354 5

Distribution of Heterotrophic and Nitrifying Bacteria Within the Aerobic-Media Trickling Filter,
W79-00433 5

Aerobic Media Trickling Filter Applied t Nitrogen Control,
W79-00445 5

A Study for Improving the Aerobic-Media Trickling Filter,
W79-00457 5D

OYSTER PONDS
First Ecological Data on the Oyster Ponds in the Bay of Bourgneuf (In French),
W79-00295 2L

OYSTERS
First Ecological Data on the Oyster Ponds in the Bay of Bourgneuf (In French),
W79-00295 2L

OZARK NATIONAL SCENIC RIVERWAYS
Water Quality in the Ozark National Scenic Riverways, Missouri,
W79-00254 5B

OZONE
Ozone in Water and Waste Water Treatment, A Bibliography, Volume 2.
W79-00306 5D

Water -- 1977.
W79-00342 5D

Pretreatment of Industrial Wastes with Ozone,
W79-00368 5D

New Technology: Ozone/UV Chemical Oxidation Wastewater Process for Metal Complexes, Organic Species and Disinfection,
W79-00369 5D

A Pilot Plant Trial for Ozone Sterilization of Fish Hatchery Water,
W79-00455 5G

PACIFIC NORTHWEST
The Development of the Electrical Power System in the Pacific Northwest, A Public Policy Perspective,
W79-00143 6E

Regional Electric Energy Planning: A Case Study in the Politics of Scarce Resources,
W79-00144 6E

PAPUA NEW GUINEA
Potential and Limitations of Rainfall-Runoff Models for Prediction on Ungauged Catchments: A Case Study from the Papua New Guinea Highlands,
W79-00491 2A

PAPUA NEW GUINEA HIGHLANDS
Potential and Limitations of Rainfall-Runoff Models for Prediction on Ungauged Catchments: A Case Study from the Papua New Guinea Highlands,
W79-00491 2A

PARAMETRIC HYDROLOGY
Stormwater Modeling,
W79-00381 5B

PARTIAL PENETRATION
Type-Curve Analysis of Time-Drawdown Data for Partially Penetrating Wells in Unconfined Anisotropic Aquifers,
W79-00136 2F

PARTICLE SIZE
Hailstone Size inferred from Dents in Cold-Rolled Aluminum Sheet,
W79-00139 7B

PARTICLE TRAJECTORIES
Numerical Study of Continuous Saltation,
W79-00314 8B

PASTURES
A Lysimetric Study of Waters in an Irrigated Pasture (In Russian),
W79-00284 2G

PATENTS
Water Filtering and Dispensing Apparatus,
W79-00019 5F

Method of Disposing of Waste Water Containing Emulsified Oil,
W79-00020 5D

Ecological System and Method,
W79-00021 5G

Treatment of Solids-Liquid-Gas Mixtures,
W79-00022 5D

Angularity Sensor Means for Center Pivot Irrigation System,
W79-00023 3F

Treatment of Effluent,
W79-00024 5D

Skimming Apparatus,
W79-00025 5G

Treatment of Lime-Sulfide Tannery Unhairing Waste,
W79-00026 5D

Low Molecular Weight Hydrolyzed Polyacrylamide Used as a Scale Inhibitor in Water Systems,
W79-00027 5F

Carbon Contact Column,
W79-00028 5D

Solid-Fluid Contacting Process,
W79-00029 5G

Biological Oxidation and Flotation Apparatus and Method,
W79-00030 5D

Flow Reducing Devices Particularly Useful as Drip Emitters for Drip Irrigation,
W79-00031 3F

Two-Step Roll Ahead Irrigation System,
W79-00032 3F

Aquatic Biotal Monitor,
W79-00033 5A

Method and Composition for Preventing Water Contaminated with Industrial Waste Seeping Through Soil Containing Said Water,
W79-00034 5G

Stabilization of Earth Subsurface Layers,
W79-00035 8D

Oil Fence,
W79-00036 5G

Energy Conversion System,
W79-00037 4B

Drip Irrigation System,
W79-00038 3F

Treatment of Water or Aqueous Systems,
W79-00039 5F

Belt Type Oil Removal Unit,
W79-00040 5G

Clarification Process,
W79-00041 5D

Color Removal Process,
W79-00042 5D

Battery Operated Water Purification System,
W79-00043 5F

Method for Treating Sewage,
W79-00044 5D

Water Distiller with Cone Shaped Condenser,
W79-00045 5F

Apparatus for Producing High-Purity Water,
W79-00046 5F

Remote Water Monitoring System,
W79-00047 7B

Apparatus for Deploying and Taking Up an Oil Fence,
W79-00048 5G

Process and System for Recovery of Energy from Geothermal Brines and Other Water Containing Sources by Direct Contact with a Working Fluid Below the Critical Pressure,
W79-00049 4B

Process and Apparatus for Separating Oil From Water Contaminated with Oil,
W79-00050 5G

Automatic System Cleaner for Remote Monitor,
W79-00051 5A

Employing Methylene Phosphonates of Oxyalkylated Polyalkylene Polyamines in Chelation and/or Scale Inhibition,
W79-00052 5F

Method for Clarifying Aqueous Waste Liquids Containing Acid Dyes,
W79-00053 5D

Process for the Treatment of Water Solution by Ion Exchange,
W79-00054 5F

Activated Sludge System with Staggered Partition Basin,
W79-00055 5D

Process for Removing Mercury and Mercury Salts from Liquid Effluents,
W79-00056 5D

Desalination Process Using Thermally Regenerable Resins,
W79-00057 3A

Method for Depolluting Fresh and Sea Water from Petroleum Products,
W79-00058 5G

Aboveground Sprinkling Device for Sprinkling System,
W79-00059 3F

Process for Purifying Aqueous Industrial Effluents.
W79-00399 5D

PATH OF POLLUTANTS
Waterhyacinth (Eichhornia Crassipes) Nutrient Uptake and Metabolism in a North Central Florida Marsh,
W79-00206 5C

Geology and Ground Water in Door County, Wisconsin, with Emphasis on Contamination Potential in the Silurian Dolomite,
W79-00256 5B

PEA
Effect of Sulfur Deficiency on Water Regime and Intensity of Pea and Wheat Photosynthesis, (In Russian),
W79-00200 2I

PEAK DISCHARGE
Analysis of Flood Resulting from the Toccoa Falls, Georgia, Dam Break,
W79-00262 2E

PENNSYLVANIA
Water/Energy Management and Evaluation Model for Pennsylvania,
W79-00007 6D

Data Base System for State Water Quality Management Information System.
W79-00222 5G

Water Resources Data for Pennsylvania, Water Year 1977--Volume 2. Susquehanna and Potomac River Basins.
W79-00265 7C

Water Resources Data for Pennsylvania, Water Year 1977--Volume 1. Delaware River Basin.
W79-00266 7C

Water Resources Data for Pennsylvania, Water Year 1977--Volume 3. Ohio River and St. Lawrence River Basins.
W79-00268 7C

PENTACHLORPHENOL
Toxicity of Sodium Pentachlorophenate (NA-PCP) to the Grass Shrimp, Palaemonetes Pugio, at Different Stages of the Molt Cycle,
W79-00078 5C

PERCOLATION
Application of Ion Exchange/Adsorption Models to Virus Transport in Percolating Beds,
W79-00353 5D

PERIPHYTON
A Periphytic Microflora Analysis of the Colorado River and Major Tributaries in Grand Canyon and Vicinity,
W79-00285 5A

PERMEABILITY
Removal of Ammonium Sulfide from Wastewater by Liquid Membrane Process,
W79-00161 5D

Allowing for the Water Permeability of Frozen Ground Screens During their Formation,
W79-00467 8D

PERSIAN GULF (IRAN)
Rainfall Frequencies for the Persian Gulf Coast of Iran,
W79-00123 2B

PESTICIDE KINETICS
Criteria Document for DDT.
W79-00276 5A

Criteria Document for Toxaphene.
W79-00281 5A

Criteria Documents for Aldrin/Dieldrin.
W79-00282 5A

Manual of Analytical Quality Control for Pesticides and Related Compounds in Human and Environmental Samples,
W79-00287 5A

PESTICIDE RESIDUES
Identification of Kepone Alteration Products in Soil and Mullet,
W79-00080 5A

Criteria Documents for Aldrin/Dieldrin.
W79-00282 5A

Laboratory Study of the Release of Pesticide and PCB Materials to the Wate Column During Dredging and Disposal Operations,
W79-00286 5A

PESTICIDE TOXICITY
Toxicity of the Fungicide Captan to the Dungeness Crab Cancer Magister,
W79-00065 5C

Toxicity of Sodium Pentachlorophenate (NA-PCP) to the Grass Shrimp, Palaemonetes Pugio, at Different Stages of the Molt Cycle,
W79-00078 5C

Criteria Document for DDT.
W79-00276 5A

Criteria Document for Toxaphene.
W79-00281 5A

Criteria Documents for Aldrin/Dieldrin.
W79-00282 5A

PHENOLS
Degradation of Aqueous Phenol Solution by Gamma Irradiation,
W79-00153 5D

PHOSOPHO-ARGININE
The Phosphagens of Some Protozoa as Ecological Indicators (In French),
W79-00423 5A

PHOSPHAGENS
The Phosphagens of Some Protozoa as Ecological Indicators (In French),
W79-00423 5A

PHOSPHATES
Fish and Wildlife Inventory of the Seven-County Region Included in the Central Florida Phosphate Industry Area-Wide Environmental Impact Study. Volumes I and II,
W79-00100 5C

Morphometric Changes in Asterionella Formosa Colonies Under Phosphate and Silicate Limitation,
W79-00215 5C

Hydrochemical Influences on the Fishery Within the Phosphate Mining Area of Eastern Idaho,
W79-00427 5C

PHOSPHORUS
Nutrient Loading/Lake Trophic Condition Relationships with Special Reference to the Influence of Flushing Rate,
W79-00001 5C

Effects of N:P Atomic Ratios and Nitrate Limitation on Algal Growth, Cell Composition, and Nitrate Uptake,
W79-00211 5C

Total Phosphorus Transport During Storm Events,
W79-00478 5B

PHOTOGRAPHY
Determination of Terrestrial Albedo from LANDSAT I Satellite Imagery in Photographic Form,
W79-00012 7B

PHOTOSYNTHESIS
Water Relations and Physiological Activity of Potatoes,
W79-00017 2I

Effect of Sulfur Deficiency on Water Regime and Intensity of Pea and Wheat Photosynthesis, (In Russian),
W79-00200 2

The Photosynthetic and Respiratory Rates and Tolerances of Benthic Algae from a Mangrove and Salt Marsh Estuary: A Comparative Study,
W79-00204 5C

Photosynthesis and Carbon Metabolism in Marine and Freshwater Diatoms,
W79-00208 5C

PHOTOSYSTHESIS
Stomatal and Nonstomatal Regulation of Water Use in Cotton, Corn and Sorghum,
W79-00016 2

PHTHALATES
Uptake and FAte of DI-2-Ethylhexyl Phthalate in Aquatic Organisms and in a Model Ecosystem,
W79-00061 5B

The Toxicity of Phthalates to the Marine Dinoflagellate Gymnodinium Breve,
W79-00063 5C

PHYTOPHILOUS FAUNA
Phytophilous Fauna in Ponds Fertilized with Sugar Factory Wastes,
W79-00217 5C

PHYTOPLANKTON
Studies on the Pathways and Effects of Cadmium in Controlled Ecosystem Enclosures,
W79-00066 5B

An Investigation of Primary Production and Ecosystem Metabolism in a Lake Michigan Dune Pond,
W79-00205 5C

Diel Cycles of Inorganic Nitrogen Uptake in a Natural Phytoplankton Population Dominated by Gonyaulax Polyedra,
W79-00210 5C

Effects of N:P Atomic Ratios and Nitrate Limitation on Algal Growth, Cell Composition and Nitrate Uptake,
W79-00211 5C

Seasonal Changes in Respiratory Enzyme Activity and Productivity in Lake Washington Microplankton,
W79-00212 5C

Phytoplankton Extracellular Release and Its Relation to the Seasonal Cycle of Dissolved Organic Carbon in a Eutrophic Lake,
W79-00213 5C

A Comparison by Size Class and Volume of Detritus Versus Phytoplankton in Chesapeake Bay,
W79-00494 2L

PICK-SLOAN MISSOURI BASIN PROGRAM
Water and Land Resource Accomplishments 1975, Statistical Appendix III--Project Data.
W79-00194 3F

PILOT PLANTS
Increased Product Water Recovery by Reverse Osmosis Using Interstage Ion Exchange Softing and a Spiractor,
W79-00301 3A

Final Report on Field Test Evaluation and Operation and Maintenance of Seawater

Reverse Osmosis and Electrodialysis Pilot Plants at Wrightsville Beach Test Facility, November 1976,
W79-00302 3A

High Temperature Elctrodialysis-Phase VI,
W79-00303 3A

Development of Low Cost Membrane Cleaning Agents,
W79-00304 3A

IPE FLOW
Shunt Meters with Segmental Orifices,
W79-00335 3F

Pipe Sizes from Modified Moody Diagram,
W79-00499 3F

IPES
Characterization of the Release of Chrysotile Asbestos from Asbestos-Cement Drinking Water Pipe,
W79-00435 5B

IPING SYSTEMS
Deflection of P.V.C. Pipe Under Burial Conditions,
W79-00103 8D

LAICE
Transuranic Nuclides in Plaice (Pleuronectes Platessa) from the North-Eastern Irish Sea,
W79-00077 5B

LANNING
Regional Electric Energy Planning: A Case Study in the Politics of Scarce Resources,
W79-00144 6E

Water Usage Requires Planning,
W79-00183 6D

Optimal Solution to the Timing, Sequencing, and Sizing of Multiple Reservoir Surface Water Supply Facilities When Demand Depends on Price,
W79-00438 6A

Residential Water Conservation,
W79-00440 3D

ANT GROWTH
Effects of N:P Atomic Ratios and Nitrate Limitation on Algal Growth, Cell Composition, and Nitrate Uptake,
W79-00211 5C

Growth, Mortality, and Biomass Partitioning in Freshwater Tidal Wetland Populations of Wild Rice (Zizania Aquatica Var. Aquatica),
W79-00214 5C

Continuous Culture of Marine Diatoms Under Silicon Limitation. 3. A Model of Si-Limited Diatom Growth,
W79-00229 5C

Water Harvesting for Afforestation: II. Survival and Growth of Trees,
W79-00475 3B

ANT GROWTH SUBSTANCES
Water Relations of Fritted Clays,
W79-00476 2G

ANT MORPHOLOGY
Morphometric Changes in Asterionella Formosa Colonies Under Phosphate and Silicate Limitation,
W79-00215 5C

PLANT PHYSIOLOGY
Atmospheric Water-Vapor Resources for Rainfall as They are Related to Water Synthesis in Plant Life, Annotated Bibliography.
W79-00106 10C

PLANT TRANSPIRATION
Chemical Inhibitors of Plant Transpiration: IV. Action of Alar-85, (In French),
W79-00247 2D

PLASTICS
Uptake and FAte of DI-2-Ethylhexyl Phthalate in Aquatic Organisms and in a Model Ecosystem,
W79-00061 5B

PLAYAS
Hydrogeochemistry of a Calcrete-Containing Aquifer Near Lake Way, Western Australia,
W79-00323 2F

PLUTONIUM
Transuranic Nuclides in Plaice (Pleuronectes Platessa) from the North-Eastern Irish Sea,
W79-00077 5B

PODZOLIC SOILS
A Lysimetric Study of Waters in an Irrigated Pasture (In Russian),
W79-00284 2G

POLAND
Benthic Algae in a Pond After the Accumulation of Beet-Sugar Factory Wastes,
W79-00216 5C

Phytophilous Fauna in Ponds Fertilized with Sugar Factory Wastes,
W79-00217 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 1. Chemism of the Rybi Potok Waters and the Chlorophyll Content in Attached Algae and Seston in Relation to the Pollution,
W79-00218 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 2. Bacteria as an Index of Water Pollution on the Rybi Potok Stream,
W79-00219 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 3. Attached Algae Communities in the Stream Rybi Potok (The High Tatra Mts, Poland) Polluted with Domestic Sewage,
W79-00220 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 4. The Bottom Fauna of the Stream Rybi Potok (The High Tatra Mts),
W79-00221 5C

POLLUTANT IDENTIFICATION
Geologic Studies to Identify the Source for High Levels of Radium and Barium in Illinois Ground-Water Supplies: A Preliminary Report,
W79-00003 5A

Development of a Manometric Fish Bioassay Technique for Water Pollution,
W79-00008 5A

Is Chrysotile Asbestos Released from Asbestos-Cement Pipe into Drinking Water.,
W79-00013 5A

Aquatic Biotal Monitor,
W79-00033 5A

Ion Selective Electrodes in Water Quality Analysis,
W79-00223 5A

PCB in Water, A Bibliography, Volume 3.
W79-00305 5A

Modeling and Monitoring of Toxic Spills and Toxic Effluents,
W79-00343 5B

Influence of Methodological Factors on Plate Counting of Aquatic Bacteria: I. Statistical Analysis of the Incidence of Time Lasting from Sample collection Up to Commencement of Counting, (In Spanish),
W79-00385 5A

Flame-Photometric Method for the Determination of Magnesium in Spent Liquors of Sulfite Pulp Mills (Plamennofotometricheskii method opredeleniya magniya v shchelokakh sul'fitnotsellyuloznogo proizvodstva),
W79-00415 5A

Musculium Transversum in the Illinois River and an Acute Potassium Bioassay Method for the Species,
W79-00443 5C

POLLUTANTS
Characterization of Spent Bleaching Liquors. Part 1. Ultrafiltration of Effluents from Conventional and Oxygen Bleaching Sequences,
W79-00419 5D

POLLUTION ABATEMENT
Oil-Troubled Water,
W79-00169 5B

On the Environmental Efficiency of Economic Systems,
W79-00230 6G

Conceptual and Statistical Issues in Developing Environmental Measures - Recent U.S. Experience,
W79-00232 6G

POLLUTION TAXES (CHARGES)
A Socio-Economic Approach to Water Pollution Law Enforcement in England and Wales,
W79-00245 5G

POLYCHLORINATED BIPHENYLS
A First Order Mass Balance Model for the Sources Distribution and Fate of PCBs in the Environment,
W79-00289 5B

Assessment of the Environmental Impacts on the Ban on Imports of PCBs,
W79-00290 5G

PCB in Water, A Bibliography, Volume 3.
W79-00305 5A

Destruction of Trace Toxic Compounds in Water and Sludge by Ionizing Radiation,
W79-00370 5D

POLYCHLORINATED TERPHENYLS
Assessment of the Environmental Impacts on the Ban on Imports of PCBs,
W79-00290 5G

POLYELECTROLYTES
Factors Influencing Induced Air Flotation,
W79-00375 5D

POLYMERS
Possible Use of Polymeric Materials for Fortification of Drainage Fills (In Russian),
W79-00439 4A

POLYVINYL CHLORIDE
Deflection of P.V.C. Pipe Under Burial Conditions,
W79-00103 8D

PONDS
An Investigation of Primary Production and Ecosystem Metabolism in a Lake Michigan Dune Pond,
W79-00205 5C

Benthic Algae in a Pond After the Accumulation of Beet-Sugar Factory Wastes,
W79-00216 5C

Phytophilous Fauna in Ponds Fertilized with Sugar Factory Wastes,
W79-00217 5C

PORE WATER
A Comparison of Ceramic and Teflon in Situ Samplers for Pore Water Determinations,
W79-00325 5A

POROSITY
Relationships Among Some Physical Properties of Soil (In Slovenian),
W79-00451 2G

POROUS MEDIA
A New Finite Element Technique for the Solution of Two-Phase Flow Through Porous Media,
W79-00135 2F

POTABLE WATER
Is Chrysotile Asbestos Released from Asbestos-Cement Pipe into Drinking Water.,
W79-00013 5A

Characterization of the Release of Chrysotile Asbestos from Asbestos-Cement Drinking Water Pipe,
W79-00435 5B

POTASSIUM
Musculium Transversum in the Illinois River and an Acute Potassium Bioassay Method for the Species,
W79-00443 5C

POTATOES
Water Relations and Physiological Activity of Potatoes,
W79-00017 2I

POTENTIOMETRIC LEVEL
Potentiometric Surface Map of the Floridan Aquifer in the St. Johns River Water Management District and Vicinity, Florida, September, 1977,
W79-00275 7C

POTOMAC RIVER BASIN
Water Resources Data for Pennsylvania, Water Year 1977--Volume 2. Susquehanna and Potomac River Basins.
W79-00265 7C

POWER PLANTS
Water -- 1977.
W79-00342 5D

Treatment of Liquid Wastes from Fossil Fuel Power Plants,
W79-00355 5D

Use of Wastewater Treatment Ponds at TVA Fossil Fueled Power Plants,
W79-00356 5D

Instrumentation and Controls for Philadelphia Electric Company Eddystone Generating Station Wastewater Treatment System,
W79-00357 5D

Design Considerations for Wastewater Treatment Systems at Existing Fossil Power Plants,
W79-00358 5D

Waste Treatment for a Profit,
W79-00359 5D

Dewatering of Sludges from Oil Fried Electric Power Generating Plants,
W79-00360 5D

Case History: Ash Disposal from an Oil Fried Central Station,
W79-00361 5E

POWERPLANTS
Wet Cooling Tower Backfitting Economics,
W79-00233 5G

PRE-IMPOUNDMENT
Organized Resistance to an Imposed Environmental Change. A Reservoir in Eastern Kentucky,
W79-00142 6B

PRECIPITATION ATMOSPHERIC
A Technique for Estimating Clock Two-Hourly Precipitation Rate Distributions,
W79-00089 2B

Solid State Event Recorder for Rainfall Measurement,
W79-00125 2B

Acid Precipitation in the Netherlands,
W79-00138 5A

Relation Between the St. Louis Urban Precipitation Anomaly and Synoptic Weather Factors,
W79-00328 2B

Mass Balance Model for Calculation of Ionic Input Loads in Atmospheric Fallout and Discharge from a Mountainous Basin,
W79-00332 5B

Isotopic Composition of Sulfur in Precipitation Within the Great Lakes Basin,
W79-00339 5A

PRECIPITATION INTENSITY
A Technique for Estimating Clock Two-Hourly Precipitation Rate Distributions,
W79-00089 2B

PRESSURE
Pressure Fluctuations Beneath Submerged Jump,
W79-00316 8B

PRESSURE FLUCTUATIONS
Pressure Fluctuations Beneath Submerged Jump,
W79-00316 8B

PRICE RIVER (UTAH)
Preliminary Identification of the Salt Pick-up and Transport Processes in the Price River Basin, Utah,
W79-00145 3C

PRICES
Land Prices Substantially Underestimate the Value of Environmental Quality,
W79-00244 6C

Residential Water Conservation,
W79-00440 3D

PRICING
The Optimal Pricing of Undepletable Externalities,
W79-00239 6C

PRIMARY PRODUCTIVITY
An Investigation of Primary Production and Ecosystem Metabolism in a Lake Michigan Dune Pond,
W79-00205 5C

Growth, Mortality, and Biomass Partitioning in Freshwater Tidal Wetland Populations of Wild Rice (Zizania Aquatica Var. Aquatica),
W79-00214 5C

PRIVATE RECREATIONAL INDUSTRY
Needs of Private for Profit Enterprises in Outdoor Recreation.
W79-00097 6E

PROBABLE MAXIMUM PRECIPITATION
Rainfall Frequencies for the Persian Gulf Coast of Iran,
W79-00123 2B

PRODUCTIVITY
Water and Land Resource Accomplishments 1975, Statistical Appendix I.
W79-00192 3F

The Productivity of a Range of Blanket Bog Vegetation Types in the Northern Pennines,
W79-00202 2I

PROJECT FEASIBILITY
Water and Land Resource Accomplishments 1975, Statistical Appendix III--Project Data.
W79-00194 3F

PROJECT PLANNING
Literature Review for Explore-I: A River Basin Water Quality Model. Appendix A,
W79-00188 5B

PROJECTS
Summary of U.S. Geological Survey Investigations and Hydrologic Conditions in the Southwest Florida Water Management District for 1977,
W79-00272 4A

PROPERTY RIGHTS
Property Rules, Liability Rules, and Environmental Economics,
W79-00241 6E

PROROCENTRUM
Annual Subsurface Transport of a Red Tide Dinoflagellate to its Bloom Area: Water Circulation Patterns and Organism Distributions in the Chesapeake Bay,
W79-00317 5C

PROTECTION
Economic Impacts of Pulp and Paper Industry Compliance with Environmental Regulations. Volume I. Summary and Aggregate Industry Impact Analyses.
W79-00430 6E

PROTOZOA
The Phosphagens of Some Protozoa as Ecological Indicators (In French),
W79-00423 5A

PSEUDOMONAS
The Effect of Cyclohexane Derivatives on Selection of Bacterial Groups Forming Activated Sludge Microflora,
W79-00159 5D

Microbial Degradation of DDT,
W79-00278 5C

Studies in Microbial Chemotactic Behavior in Seawater,
W79-00293 5C

PUBLIC POLICY
Conceptual and Statistical Issues in Developing Environmental Measures - Recent U.S. Experience,

PULP WASTES
Kamloops Cleans Condensates with Steam Stillation,
W79-00162 5D

Radiation-Induced Degradation of Lignin in Aqueous Solutions,
W79-00164 5D

Designing and Operating an Oxygen Activated Sludge System Including Tertiary Alum-Mud Precipitation,
W79-00350 5D

Sludge Treatment by Supersonic Jet-Flame,
W79-00403 5E

Biologically Active Substances in Pulping Waste Liquors. I. Substances Active Against Termites, Coptotermes Formosanus Shiraki, in Kraft Pulping and Bleaching Wastes,
W79-00404 5D

Investigation of Factors Affecting BOD Measurement and Experience with the 1-Day BOD Test,
W79-00405 5A

Bioassay Results of Kraft Mill Effluent at Artificially Elevated Levels of Biosolids,
W79-00406 5C

A Study of the Fate of Biosolids from Biologically Treated Effluent in Laboratory and Constructed Streams,
W79-00407 5C

Steam Stripping Reduces Condensate at Weyco Mill,
W79-00409 3E

Process Design Investigations for Alaska Pulp Mill Wastewater Treatment Facilities,
W79-00412 5D

EPA's Goal for Suspended Solids is Not Met with Media Filtration,
W79-00414 5D

Energy Consumption for Electrodialysis of Spent Sulfite Liquors (Energozatraty na elektrodializ otrabotannogo shcheloka sul'fitnotsellyuloznogo proizvodstva),
W79-00416 5D

Electric Resistance of the Cation-Selective MK-40 Membrane During Electrodialysis of Spend Sulfite Liquor (Elektrosoprotivlenie kationoselektivnoy membrany MK-40 pri elektrodialze otrabotannogo sul'fitnogo shcheloka),
W79-00417 5A

Clarifier With Suspended Layer of Sediment (Osvetlitel' so vzveshennym sloem osadka),
W79-00421 5D

Analyses of Paper Machine Waters with Ion Specific Electrodes. Part IV. Sulfate Determination Using Pb(2+) Ion Specific Electrode and Various measurement Methods,
W79-00429 5A

PUMPING
Ground-Water Data, 1974-76, Indian Wells Valley, Kern, Inyo, and San Bernardino Counties, California,
W79-00253 7C

PUMPS
Well Point Systems.
W79-00182 8C

QUICKFLOW
Factors Controlling Variations in River Water Quality in Kansas,
W79-00006 5B

RADAR
Agricultural and Hydrological Applications of Radar: Final Report,
W79-00464 7B

RADIAL FLOWS
Air Entrainment in Radial Flow Towards Intakes,
W79-00315 8B

RADIOACTIVE WASTES
Analysis of Radioactive Contaminants in By-Products from Coal-Fired Power Plant Operations,
W79-00227 5A

RADIOCHEMICAL ANALYSIS
Analysis of Radioactive Contaminants in By-Products from Coal-Fired Power Plant Operations,
W79-00227 5A

RADIOISOTOPES
Uptake of Americum-241 by Algae and Bacteria,
W79-00067 5B

Transuranic Nuclides in Plaice (Pleuronectes Platessa) from the North-Eastern Irish Sea,
W79-00077 5B

Analysis of Radioactive Contaminants in By-Products from Coal-Fired Power Plant Operations,
W79-00227 5A

RADIOMETRY
Determination of Terrestrial Albedo from LANDSAT I Satellite Imagery in Photographic Form,
W79-00012 7B

RADIUM
Geologic Studies to Identify the Source for High Levels of Radium and Barium in Illinois Ground-Water Supplies: A Preliminary Report,
W79-00003 5A

RAIN
Is Chrysotile Asbestos Released from Asbestos-Cement Pipe into Drinking Water.,
W79-00013 5A

Determination of Chrysotile Asbestos in Rainwater,
W79-00014 5A

RAIN GAGES
Solid State Event Recorder for Rainfall Measurement,
W79-00125 2B

Electric Rainfall Intensity Sensor,
W79-00329 2B

RAIN WATER
Investigation of Rainwater for the Presence of Asbestos,
W79-00437 5A

RAINBOW TROUT
Growth and Diets of Trout from Contrasting Environments in a Geothermally Heated Stream: The Firehole River of Yellowstone National Park,
W79-00082 5C

RAINFALL
A Technique for Estimating Clock Two-Hourly Precipitation Rate Distributions,
W79-00089 2B

Atmospheric Water-Vapor Resources for Rainfall as They are Related to Water Synthesis in Plant Life, Annotated Bibliography.
W79-00106 10C

Local Differences in the Patterns of Variability of Tropical Rainfall: Some Characteristics and Implications,
W79-00113 2B

Rainfall Frequencies for the Persian Gulf Coast of Iran,
W79-00123 2B

Solid State Event Recorder for Rainfall Measurement,
W79-00125 2B

RAINFALL

A Storm Rainfal Pattern Above the Central African Plateau,
W79-00126 2B

Climatology of Instantaneous Rainfall Rates,
W79-00327 2B

Relation Between the St. Louis Urban Precipitation Anomaly and Synoptic Weather Factors,
W79-00328 2B

Electric Rainfall Intensity Sensor,
W79-00329 2B

Relationship of Rainfall and Lake Groundwater Seepage,
W79-00489 5B

RAINFALL DISPOSITION
A Storm Rainfal Pattern Above the Central African Plateau,
W79-00126 2B

RAINFALL INTENSITY
A Technique for Estimating Clock Two-Hourly Precipitation Rate Distributions,
W79-00089 2B

Climatology of Instantaneous Rainfall Rates,
W79-00327 2B

Electric Rainfall Intensity Sensor,
W79-00329 2B

RAINFALL-RUNOFF RELATIONSHIP
Regionalization of Stormwater Response for the Tennessee Valley Using the Lag Modulus Concept,
W79-00447 5G

RAINFALL-RUNOFF RELATIONSHIPS
Potential and Limitations of Rainfall-Runoff Models for Prediction on Ungauged Catchments: A Case Study from the Papua New Guinea Highlands,
W79-00491 2A

REAERATION
Laboratory Studies of Gas Tracers for Reaeration,
W79-00270 5A

RECENT EPOCH
Inland Ice Sheet Thinning Due to Holocene Warmth,
W79-00340 2C

RECLAIMED WATER
Reject Stream Replacement Study.
W79-00092 3A

RECLAMATION
Textile Waste Waters: Treatment and Environmental Effects,
W79-00166 3E

RECREATION
Protection of Outdoor Recreation Values of Rivers.
W79-00093 6B

Public Outdoor Recreation Benefits of Federal Water Resource Projects.
W79-00094 6E

Federal Outdoor Recreation Land Acquisition-LWCF.
W79-00095 6E

Energy Conservation and Outdoor Recreation,
W79-00096 6G

Needs of Private for Profit Enterprises in Outdoor Recreation.
W79-00097 6B

Roles/Functions of Federal, State and Local Public Agencies.
W79-00098 6E

RECREATION AREAS
Water and Land Resource Accomplishments 1975, Statistical Appendix III--Project Data.
W79-00194 3F

RECREATION DEMAND
Needs of Private for Profit Enterprises in Outdoor Recreation.
W79-00097 6B

RECREATION FACILITIES
Roles/Functions of Federal, State and Local Public Agencies.
W79-00098 6E

Water Quality in the Ozark National Scenic Riverways, Missouri,
W79-00254 5B

RECREATION USAGE
Water and Land Resource Accomplishments 1975, Statistical Appendix I.
W79-00192 3F

RECYCLING
Waste Treatment for a Profit,
W79-00359 5D

The Feasibility of Using Forest Lands for Recycling Sludge Nutrients in Northern New England,
W79-00446 5E

RED TIDE
Diel Cycles of Inorganic Nitrogen Uptake in a Natural Phytoplankton Population Dominated by Gonyaulax Polyedra,
W79-00210 5C

Annual Subsurface Transport of a Red Tide Dinoflagellate to its Bloom Area: Water Circulation Patterns and Organism Distributions in the Chesapeake Bay,
W79-00317 5C

REFORESTATION
Our Reclamation Future: The Missing Bet on Trees,
W79-00086 4C

REGIONAL ANALYSIS
Regional Geology Series: Part VII, The Colorado Plateau,
W79-00177 8B

Regionalization of Stormwater Response for the Tennessee Valley Using the Lag Modulus Concept,
W79-00447 5G

REGIONAL ELECTRIC ENERGY
Regional Electric Energy Planning: A Case Study in the Politics of Scarce Resources,
W79-00144 6E

REGIONAL FLOOD
Flood Regions in Jamaica,
W79-00330 2E

REGULATION
A Socio-Economic Approach to Water Pollution Law Enforcement in England and Wales,
W79-00245 5G

Lake Superior Regulation Effects,
W79-00388 4C

REMOTE SENSING
Remote Water Monitoring System,
W79-00047

Automatic System Cleaner for Remote Mo
tor,
W79-00051

Applications of Remote Sensing to Hydrolo
Planning,
W79-00099

Summaries of Physical Research in
Geosciences.
W79-00101 1

Remote Monitoring of Coal Strip Mine Rel
bilitation,
W79-00226

Agricultural and Hydrological Applications
Radar: Final Report,
W79-00464

REPAYMENT CONTRACTS
Water and Land Resource Accomplishmer
1975, Statistical Appendix II-Finances a
Physical Features.
W79-00193

RESEARCH PRIORITIES
Research to Anticipate Environmental Impac
of Changing Resource Usage.
W79-00085

RESERVOIR MANAGEMENT
Operating Model for the Green River Bas
Reservoir System,
W79-00452

RESERVOIR OPERATION
Field Investigation of Selective Withdrawal,
W79-00119

Optimal Operation of Shelbyville and Carly
Lakes,
W79-00392

Operating Model for the Green River Bas
Reservoir System,
W79-00452

Control of Water Residence Time in Sma
Reservoirs,
W79-00482

RESERVOIR YIELD
Optimal Solution to the Timing, Sequencin
and Sizing of Multiple Reservoir Surface Wat
Supply Facilities When Demand Depends o
Price,
W79-00438

RESERVOIRS
Overgrowing of the Kara Kum Canal and Som
Aftereffects of Introducing the White Amu
into Water Bodies, (In Russian),
W79-00207

Control of Water Residence Time in Sma
Reservoirs,
W79-00482

Climate Change: Detection and Its Impact o
Hydrologic Design,
W79-00492

RESIDENCE TIME
Control of Water Residence Time in Smal
Reservoirs,
W79-00482

RESINS
Preliminary Study of Selected Potential Environmental Contaminants - Optical Brighteners, Methyl Chloroform, Tri-Chloroethylene, Tetrachloroethylene and ion Exchange Resins,
W79-00283 5A

RESOURCES DEVELOPMENT
Research to Anticipate Environmental Impacts of Changing Resource Usage.
W79-00085 6G

RESPIRATION
Effects of Feeding and of Chemical Stimulation on the Oxygen Uptake of Nassarius Reticulatus (Gastropoda: Prosobranchia),
W79-00083 5C

The Photosynthetic and Respiratory Rates and Tolerances of Benthic Algae from a Mangrove and Salt Marsh Estuary: A Comparative Study,
W79-00204 5C

Seasonal Changes in Respiratory Enzyme Activity and Productivity in Lake Washington Microplankton,
W79-00212 5C

REST AREAS
Water Reuse at Highway Rest Areas: Evaluation Phase,
W79-00087 5D

REVERSE OSMOSIS
Controls Drive Platers to Materials Recovery,
W79-00154 5D

Laboratory Studies on Advanced Composite H F Modules for Seawater Reverse Osmosis,
W79-00300 3A

Final Report on Field Test Evaluation and Operation and Maintenance of Seawater Reverse Osmosis and Electrodialysis Pilot Plants at Wrightsville Beach Test Facility, November 1976,
W79-00302 3A

EVIEWS
Frazil Ice Formation: A Review,
W79-00120 2C

Progress and Problems in the Study of Plant-Water Interrelations (In Bulgarian),
W79-00187 2I

Cattails (Typha Spp.)--Weed Problem or Potential Crop.,
W79-00198 2I

ISK ANALYSIS
Stochastic Processes in Water Resources Engineering.
W79-00380 8B

IVER BASIN DEVELOPMENT
Literature Review for Explore-I: A River Basin Water Quality Model. Appendix A,
W79-00188 5B

User's Manual for EXPLORE-I: A River Basin Water Quality Model. Appendix B,
W79-00189 5B

Programmer's Manual for EXPLORE-I: A River Basin Water Quality. Appendix C,
W79-00190 5B

Optimal Solution to the Timing, Sequencing, and Sizing of Multiple Reservoir Surface Water Supply Facilities When Demand Depends on Price,
W79-00438 6A

RIVER FLOW
Total Phosphorus Transport During Storm Events,
W79-00478 5B

RIVER PROTECTION
Protection of Outdoor Recreation Values of Rivers.
W79-00093 6B

RIVER SYSTEMS
A General Two Dimensional River Simulator,
W79-00397 2E

RIVERS
Factors Controlling Variations in River Water Quality in Kansas,
W79-00006 5B

Frazil Ice Formation: A Review,
W79-00120 2C

River Temperature Variation with Freezing and Storage,
W79-00477 2E

ROCKFILL DAMS
Using Ice as Water-Impermeable Element in Rockfill Dams,
W79-00466 8D

RUNOFF
A Field Evaluation of Subsurface and Surface Runoff, I. Tracer Studies,
W79-00115 2E

A Field Evaluation of Subsurface and Surface Runoff, II. Runoff Processes,
W79-00116 2E

An Estimate of Annual Runoff from England and Wales, 1728-1976,
W79-00124 2E

Sampling and Modeling of Non-Point Sources at a Coal-Fired Utility,
W79-00279 5B

Rural Water Supplies from Laterite Runoff,
W79-00387 5F

The Application of Linear Programming to Run-Off Management,
W79-00393 4A

Water Harvesting for Afforestation: I. Efficiency and Life Span of Asphalt Cover,
W79-00474 3B

RURAL WATER QUALITY
Nature and Impact of Rural Stream Inputs on Water Quality,
W79-00483 5C

RYBI POTOK (POLAND)
Biocenosis of a High Mountain Stream Under the Influence of Tourism. 1. Chemism of the Rybi Potok Waters and the Chlorophyll Content in Attached Algae and Seston in Relation to the Pollution,
W79-00218 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 2. Bacteria as an Index of Water Pollution on the Rybi Potok Stream,
W79-00219 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 3. Attached Algae Communities in the Stream Rybi Potok (The High Tatra Mts, Poland) Polluted with Domestic Sewage,
W79-00220 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 4. The Bottom Fauna of the Stream Rybi Potok (The High Tatra Mts),
W79-00221 5C

SAFETY
Safety Aspects of Toxic and Hazardous Spills,
W79-00345 5G

Management Plan for Control and Treatment of Toxic Substances,
W79-00346 5G

SAINE SOILS
Correlation Between the Salt Content in the Hard Phase and Soil Solutions of the Murghab Oasis Desert-Meadow Soils of Ancient Irrigation, (In Russian),
W79-00203 2G

SALINE WATER INTRUSION
No Water-Source Damage Found in Oil States.
W79-00172 5G

SALINITY
Preliminary Identification of the Salt Pick-up and Transport Processes in the Price River Basin, Utah,
W79-00145 3C

Survival and Oxygen Consumption of Young Kura Carp Under Various Keeping Conditions (In Russian),
W79-00180 2H

Correlation Between the Salt Content in the Hard Phase and Soil Solutions of the Murghab Oasis Desert-Meadow Soils of Ancient Irrigation, (In Russian),
W79-00203 2G

First Ecological Data on the Oyster Ponds in the Bay of Bourgneuf (In French),
W79-00295 2L

SALINITY STRUCTURE
The Effect of Reduced Wetlands and Storage Basins on the Size, Stability and Productivity of the Watershed Mixing Zone,
W79-00441 2L

SALT MARSHES
The Photosynthetic and Respiratory Rates and Tolerances of Benthic Algae from a Mangrove and Salt Marsh Estuary: A Comparative Study,
W79-00204 5C

SALTATION
Numerical Study of Continuous Saltation,
W79-00314 8B

SAMPLING
Remote Water Monitoring System,
W79-00047 7B

Automatic System Cleaner for Remote Monitor,
W79-00051 5A

Nonmetallic Electrofishing Booms and Accessory Tackle,
W79-00069 7B

Collection Bucket for Use with Tow Nets for Larval Fish,
W79-00070 7B

Quantitative Comparison of Seining and Underwater Observation for Stream Fishery Surveys,
W79-00072 7B

Artificial Substrate Sampler for Benthic Invertebrates in Ponds, Small Lakes, and Reservoirs,
W79-00074 7B

A Comparison of Ceramic and Teflon in Situ Samplers for Pore Water Determinations,
W79-00325 5A

SAN BERNARDINO COUNTY
Ground-Water Data, 1974-76, Indian Wells Valley, Kern, Inyo, and San Bernardino Counties, California,
W79-00253 7C

SARDINIA
The Phosphagens of Some Protozoa as Ecological Indicators (In French),
W79-00423 5A

SATELLITES (ARTIFICIAL)
Applications of Remote Sensing to Hydrologic Planning,
W79-00099 7B

SCALING
Low Molecular Weight Hydrolyzed Polyacrylamide Used as a Scale Inhibitor in Water Systems,
W79-00027 5F

Employing Methylene Phosphonates of Oxyalkylated Polyalkylene Polyamines in Chelation and/or Scale Inhibition,
W79-00052 5F

SCHEDULING
Shortest Path Problems in Hydrogeology,
W79-00137 6A

SCHUYLKILL RIVER (PENN)
Environmental Effects of Schuylkill Oil Spill II, June 1972.
W79-00294 5C

SCOUR
Scour of Bed Material in Very Rough Channels,
W79-00122 2J

SEA ICE
Icebreaking Capability of CCGS 'Labrador' in Western Barrow Strait, October 23-28, 1973,
W79-00090 2C

SEA WATER
Optical Classification of Natural Waters,
W79-00318 2L

On-Site Generation of Hypochlorite Solutions by Electrolysis of Seawater,
W79-00372 5F

SEASONAL
The Effects of Heavy Metals on Algae Populations in a South Central Reservoir,
W79-00011 5C

Seasonal Changes in Respiratory Enzyme Activity and Productivity in Lake Washington Microplankton,
W79-00212 5C

Phytoplankton Extracellular Release and Its Relation to the Seasonal Cycle of Dissolved Organic Carbon in a Eutrophic Lake,
W79-00213 5C

SEDIMENT
Environmental Management Strategy for the Great Lakes System.
W79-00084 5G

SEDIMENT TRANSPORT
Measurements of Bed Load in Oscillatory Flow,
W79-00141 2J

SEDIMENTS
Mechanical Characteristics of Debris Flow,
W79-00117 2J

The Determination of Quantity and Quality of Great Lakes United States Shoreline Eroded Material,
W79-00249 5B

Forms of Trace Elements in Soils, Sediments, and Associated Waters: An Overview of Their Determination and Biological Availability,
W79-00271 5B

Continuous Simulation of Nonpoint Pollution,
W79-00493 5B

SEEPAGE
Method and Composition for Preventing Water Contaminated with Industrial Waste Seeping Through Soil Containing Said Water,
W79-00034 5G

Relationship of Rainfall and Lake Groundwater Seepage,
W79-00489 5B

Free-Surface Seepage Problem,
W79-00496 8D

SEEPAGE CONTROL
Seepage Control by Particle Size Selection,
W79-00484 4A

SEICHES
Hydraulics of Great Lakes Inlets,
W79-00469 8B

SEINE SURVEY
Quantitative Comparison of Seining and Underwater Observation for Stream Fishery Surveys,
W79-00072 7B

SELENIUM
Automated Determination of Selenium in Water,
W79-00261 5A

SELF-PURIFICATION
Biocenosis of a High Mountain Stream Under the Influence of Tourism. 2. Bacteria as an Index of Water Pollution on the Rybi Potok Stream,
W79-00219 5C

SEPARATION TECHNIQUES
Oil/Water Separation Technology: The Options Available - Part 2,
W79-00158 5G

SETTLEMENT (STRUCTURAL)
Groundwater Pumping Techniques for Excavations and Other Works,
W79-00185 8G

SEWAGE
Characterization of Performance of Full-Scale Tertiary Wastewater Granular Media Filters,
W79-00371 5D

SEWAGE BACTERIA
Recovery of Sanitary-Indicator Bacteria from Streams Containing Acid Mine Water,
W79-00444 5A

SEWAGE DISPOSAL
Transpiration and Evaporation of Sewage Effluent,
W79-00088 5D

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 1. Chemism of the Rybi Potok Waters and the Chlorophyll Content in Attached Algae and Seston in Relation to the Pollution,
W79-00218 5C

Biocenosis of a High Mountain Stream Under the Influence of Tourism. 4. The Bottom Fauna of the Stream Rybi Potok (The High Tatra Mts),
W79-00221 5C

Simple Model for Ocean Outfall Plumes,
W79-00479 5B

SEWAGE EFFLUENTS
Transpiration and Evaporation of Sewage Effluent,
W79-00088 5D

Tracing Sewage Effluent Recharge - Tucson, Arizona,
W79-00299 5A

Survival and Early Growth of Selected Trees on Waste Water Application Sites,
W79-00422 5E

A Note on Effects of Sewage Effluent Irrigation on Specific Gravity and Growth Rate of White and Red Oaks,
W79-00425 5E

SEWAGE LAGOONS
Use of Wastewater Treatment Ponds at TVA Fossil Fueled Power Plants,
W79-00356 5D

SEWAGE TREATMENT
Treatment of Solids-Liquid-Gas Mixtures,
W79-00022 5D

Carbon Contact Column,
W79-00028 5D

Biological Oxidation and Flotation Apparatus and Method,
W79-00030 5D

Method for Treating Sewage,
W79-00044 5D

Transpiration and Evaporation of Sewage Effluent,
W79-00088 5D

Distribution of Heterotrophic and Nitrifying Bacteria Within the Aerobic-Media Trickling Filter,
W79-00433 5D

Aerobic Media Trickling Filter Applied to Nitrogen Control,
W79-00445 5D

A Study for Improving the Aerobic-Media Trickling Filter,
W79-00457 5D

SEWERS
Tunnel Component of the Tunnel and Reservoir Plan Proposed by the Metropolitan Sanitary District of Greater Chicago, Lower Des Plaines Tunnel System.
W79-00465 5D

SHALLOW LAKE EVAPORATION
A Simple Model for Shallow Lake Evaporation,
W79-00326 2D

SHEAR DRAG
Eddy Production Inside Wall Layers,
W79-00333 8B

SHORES
The Determination of Quantity and Quality of Great Lakes United States Shoreline Eroded Material,
W79-00249 5B

SHORTEST PATH
Shortest Path Problems in Hydrogeology,
W79-00137 6A

SHRIMP
Toxicity of Sodium Pentachlorophenate (NA-PCP) to the Grass Shrimp, Palaemonetes Pugio, at Different Stages of the Molt Cycle,
W79-00078 5C

SHUNT METERS
Shunt Meters with Segmental Orifices,
W79-00335 3F

SILICATES
Morphometric Changes in Asterionella Formosa Colonies Under Phosphate and Silicate Limitation,
W79-00215 5C

Formation of a Vermiculite Mineral from Ground Water Components (In Russian),
W79-00382 2K

SILICON
Sea-Water Neutralization of Effluents from the Industrial Processing of Phosphorite. A Case Study in the Practical Use of Basic Knowledge in Analytical and Marine Chemistry,
W79-00151 5G

Continuous Culture of Marine Diatoms Under Silicon Limitation. 3. A Model of Si-Limited Diatom Growth,
W79-00229 5C

SILICONES
UNOX Wastewater Treatment System Performance Silicone Chemical Complex,
W79-00349 5D

SILURIAN DOLOMITE
Geology and Ground Water in Door County, Wisconsin, with Emphasis on Contamination Potential in the Silurian Dolomite,
W79-00256 5B

SIMULATION ANALYSIS
Literature Review for Explore-I: A River Basin Water Quality Model. Appendix A,
W79-00188 5B

User's Manual for EXPLORE-I: A River Basin Water Quality Model. Appendix B,
W79-00189 5B

Programmer's Manual for EXPLORE-I: A River Basin Water Quality. Appendix C,
W79-00190 5B

Simulation of Flows in Ungaged Basins,
W79-00331 2E

Modelling the Water Quality of the Hydrological Cycle.
W79-00379 5B

Stochastic Processes in Water Resources Engineering.
W79-00380 8B

Optimal Operation of Shelbyville and Carlyle Lakes,
W79-00392 4A

A General Two Dimensional River Simulator,
W79-00397 2E

A Water Quality Model for the South Platte River Basin, Documentation Report,
W79-00398 5B

SIZE
A Comparison by Size Class and Volume of Detritus Versus Phytoplankton in Chesapeake Bay,
W79-00494 2L

SKANE (SWEDEN)
Diversity and Environments of Benthic Invertebrate Communities in South Swedish Streams,
W79-00209 5C

SKELETONEMA COSTATUM
Continuous Culture of Marine Diatoms Under Silicon Limitation. 3. A Model of Si-Limited Diatom Growth,
W79-00229 5C

SLUDGE
Dewatering of Sludges from Oil Fried Electric Power Generating Plants,
W79-00360 5D

Case History: Ash Disposal from an Oil Fried Central Station,
W79-00361 5E

SLUDGE DISPOSAL
Pretreatment Land Application of Textile Plant Wastes,
W79-00362 5E

The Feasibility of Using Forest Lands for Recycling Sludge Nutrients in Northern New England,
W79-00446 5E

Leaching Characteristics of Various Heavy Metals, Non-Heavy Metals and Anions from Municipal Sewage Sludge Ash,
W79-00459 5B

SLUDGE TREATMENT
Water -- 1977.
W79-00342 5D

Sludge Treatment by Supersonic Jet-Flame,
W79-00403 5E

SNAILS
Effects of Feeding and of Chemical Stimulation on the Oxygen Uptake of Nassarius Reticulatus (Gastropoda: Prosobranchia),
W79-00083 5C

SNORKEL SURVEY
Quantitative Comparison of Seining and Underwater Observation for Stream Fishery Surveys,
W79-00072 7B

SOCIAL CHANGE
A Comparative Study of Community Response to Water Related Problems,
W79-00010 6B

SOCIAL IMPACT
Organized Resistance to an Imposed Environmental Change. A Reservoir in Eastern Kentucky,
W79-00142 6B

SOCIAL VALUES
Organized Resistance to an Imposed Environmental Change. A Reservoir in Eastern Kentucky,
W79-00142 6B

Modeling for Organizational Decision-Making: Profits vs. Social Values in Resource Management,
W79-00243 6A

SOCIOECONOMIC THEORY
Natural Resource Economics: The Upsetting Discipline,
W79-00242 6B

SODA BUTTE
Yellowstone National Park Survey May-August 1970, Includes Soda Butte Survey, May-October 1969.
W79-00250 5A

SODIUM COMPOUNDS
Toxicity of Sodium Pentachlorophenate (NA-PCP) to the Grass Shrimp, Palaemonetes Pugio, at Different Stages of the Molt Cycle,
W79-00078 5C

Recovery of Tin from Electroplating Solutions and Rinse Waters,
W79-00157 5D

SOIL AGGREGATES
Relationships Among Some Physical Properties of Soil (In Slovenian),
W79-00451 2G

SOIL COMPACTION
Control of Furrow Infiltration by Compaction,
W79-00481 3F

SOIL CONSERVATION
Soil, Water and Air Sciences Research.
W79-00105 2G

SOIL EROSION
Grazing and Logging Effects on Soil Surface Changes in Central Colorado's Ponderosa Pine Type,
W79-00140 4C

Methodical Problems in the Evaluation and Mapping of Erosion-Endangered Lands (In Russian),
W79-00462 2J

SOIL MECHANICS
Deflection of P.V.C. Pipe Under Burial Conditions,
W79-00103 8D

SOIL MOISTURE
A Lysimetric Study of Waters in an Irrigated Pasture (In Russian),
W79-00284 2G

Field Observations of the Moisture Regime of a Yellow-Grey Earth (Otokia Silt Loam) in Eastern Otago,
W79-00310 2G

SOIL MOISTURE

Changes in Water Regime of Brown Forest Soils of the Georgian SSR Under the Effect of Silvicultural Practices, (In Russian),
W79-00401 4C

Relationships Among Some Physical Properties of Soil (In Slovenian),
W79-00451 2G

A Soil Moisture Budget Model Accounting for Shallow Water Table Influences,
W79-00473 2G

SOIL PHYSICAL PROPERTIES
Deflection of P.V.C. Pipe Under Burial Conditions,
W79-00103 8D

Water and Physical Properties of the Sod-Calcareous Soils of the Crimean Foothills (In Russian),
W79-00269 2G

Relationships Among Some Physical Properties of Soil (In Slovenian),
W79-00451 2G

SOIL-PLANT-WATER RELATIONSHIPS
Water Harvesting for Afforestation: II. Survival and Growth of Trees,
W79-00475 3B

SOIL SEALANTS
Method and Composition for Preventing Water Contaminated with Industrial Waste Seeping Through Soil Containing Said Water,
W79-00034 5G

SOIL STABILITY
Stabilization of Earth Subsurface Layers,
W79-00035 8D

SOIL TREATMENT
Pretreatment Land Application of Textile Plant Wastes,
W79-00362 5E

Effect of Whey Application on Chemical Properties of Soils and Crops,
W79-00363 5E

SOIL WATER MOVEMENT
Steady Infiltration from Single and Periodic Strip Sources,
W79-00471 2G

Solute Transport During Absorption of Water by Soil: Laboratory Studies and their Practical Implications,
W79-00472 2G

SOIL-WATER-PLANT RELATIONSHIPS
Progress and Problems in the Study of Plant-Water Interrelations (In Bulgarian),
W79-00187 2I

SOILS
Irrigated Soils of the Milskaya Plain (In Russian),
W79-00060 2G

Reclamation of Meadow-Chernozem Solonetzes of the Kustanai Oblast, (In Russian),
W79-00395 2G

SOLAR ENERGY
Housing Project to Utilize Ground Water.
W79-00178 8C

SOLDIER CREEK DAM (UT)
Water and Land Resource Accomplishments 1975. Summary Report.
W79-00191 3F

SOLID WASTES
Adsorption of Some Toxic Substances by Waste Components,
W79-00152 5B

SOLIDS CONTACT PROCESS
Solid-Fluid Contacting Process,
W79-00029 5G

SOLONETZER
Reclamation of Meadow-Chernozem Solonetzes of the Kustanai Oblast, (In Russian),
W79-00395 2G

SOLUBILITY
The Environmental Effects of Chromium in Tannery Effluents,
W79-00156 5C

Recovery of Tin from Electroplating Solutions and Rinse Waters,
W79-00157 5D

SOLUTES
Solute Transport During Absorption of Water by Soil: Laboratory Studies and their Practical Implications,
W79-00472 2G

SOLVENT EXTRACTION
Water -- 1977.
W79-00342 5D

Solvent Extraction for Treatment of Wastewaters from Acetic-Acid Manufacture,
W79-00366 5D

SOLVENTS
Preliminary Study of Selected Potential Environmental Contaminants - Optical Brighteners, Methyl Chloroform, Tri-Chloroethylene, Tetrachloroethylene and ion Exchange Resins,
W79-00283 5A

SONOITA CREEK BASIN (ARIZ)
Determination of Terrestrial Albedo from LANDSAT I Satellite Imagery in Photographic Form,
W79-00012 7B

SORGHUM
Stomatal and Nonstomatal Regulation of Water Use in Cotton, Corn and Sorghum,
W79-00016 2I

SORPTION
Sorption Capabilities of Various Materials for Leachate Treatment,
W79-00377 5D

SOUTH PLATTE RIVER BASIN (COLORADO)
A Water Quality Model for the South Platte River Basin, Documentation Report,
W79-00398 5B

SOUTH VIETNAM
Hydrogeologic Reconnaissance of the Mekong Delta in South Vietnam and Cambodia,
W79-00255 7C

SOUTHWEST NEBRASKA
Ground-Water Availability in the Hitchcock-Red Willow, Frenchman Valley, and Meeker-Driftwood Irrigation Districts, Southwest Nebraska,
W79-00260 4B

SOVIET UNION
On the Environmental Efficiency of Economic Systems,
W79-00230 6G

SOYBEANS
Nitrate Reductase Activity of Soybeans in Relation to other Indicators of Water Stress,
W79-00149 2I

SPECIES COMPOSITION
Phytophilous Fauna in Ponds Fertilized with Sugar Factory Wastes,
W79-00217 5C

SPECIES DIVERSITY
Diversity and Environments of Benthic Invertebrate Communities in South Swedish Streams,
W79-00209 5C

Species Diversity Indices of the Fish Populations of Streams Draining Selected Test Areas on Eglin Air Force Base Reservation Florida,
W79-00277 7C

A Periphytic Microflora Analysis of the Colorado River and Major Tributaries in Grand Canyon and Vicinity,
W79-00285 5A

SPECIES DIVERSITY INDICES
Species Diversity Indices of the Fish Populations of Streams Draining Selected Test Areas on Eglin Air Force Base Reservation Florida,
W79-00277 7C

SPECIFIC GRAVITY
A Note on Effects of Sewage Effluent Irrigation on Specific Gravity and Growth Rate of White and Red Oaks,
W79-00425 5E

SPECIFIC ION ELECTRODE
Ion Selective Electrodes in Water Quality Analysis,
W79-00223 5A

SPILLWAYS
Hydraulic Model Investigation of a Two-Way Drop Inlet for Floodwater Retarding Structure No. 3, Banklick Creek Watershed, Boone and Kenton Counties, Kentucky,
W79-00341 8B

SPOIL BANKS
Determination of Spoil-Bank Erosion Rates in Ohio by Using Interbank Sediment Accumulations,
W79-00495 2J

SPRAY IRRIGATION
Transpiration and Evaporation of Sewage Effluent,
W79-00088 5D

SPRINGS
A Novel Method of Estimating the Discharge of Water from Mound Springs of the Great Artesian Basin, Central Australia,
W79-00112 2F

SPRINKLER IRRIGATION
Aboveground Sprinkling Device for Sprinkling System,
W79-00059 3F

ST. JOHNS RIVER WATER MANAGEMENT
Potentiometric Surface Map of the Floridan Aquifer in the St. Johns River Water Management District and Vicinity, Florida, September, 1977,
W79-00275 7C

ST. LAWRENCE RIVER BASIN
Water Resources Data for Pennsylvania, Water Year 1977--Volume 3. Ohio River and St. Lawrence River Basins.
W79-00268 7C

ST. LOUIS (MO)
Relation Between the St. Louis Urban Precipitation Anomaly and Synoptic Weather Factors,
W79-00328 2B

STATE GOVERNMENT
Roles/Functions of Federal, State and Local Public Agencies.
W79-00098 6E

STATISTICAL METHODS
Stream Temperature Estimation Using Kalman Filter,
W79-00121 5B

Influence of Methodological Factors on Plate Counting of Aquatic Bacteria: I. Statistical Analysis of the Incidence of Time Lasting from Sample collection Up to Commencement of Counting, (In Spanish),
W79-00385 5A

STEAM
Nekoosa Cleans Condensates with Steam Distillation,
W79-00162 5D

Steam Stripping Reduces Condensate at Weyco Mill,
W79-00409 3E

How to Utilize Steam from Thermorefiners. (Hur utnyttja anga fran termoraffinoerer),
W79-00418 3E

STOCHASTIC PROCESSES
Stochastic Processes in Water Resources Engineering.
W79-00380 8B

Stormwater Modeling,
W79-00381 5B

STOMATA
Stomatal and Nonstomatal Regulation of Water Use in Cotton, Corn and Sorghum,
W79-00016 2I

Water Relations and Physiological Activity of Potatoes,
W79-00017 2I

STONEFLIES
Adaptations and Resistance to Anoxia in Cloeon Dipterum (Ephemeroptera) and Nemoura Cinerea (Plecoptera),
W79-00076 5G

STORM RUNOFF
High-Flow Frequencies for Selected Streams in Oklahoma,
W79-00273 2E

Regionalization of Stormwater Response for the Tennessee Valley Using the Lag Modulus Concept,
W79-00447 5G

STORM WATER
Stormwater Modeling,
W79-00381 5B

STORMWATER
Characterization and Treatment of Stormwater Runoff,
W79-00005 5B

Regionalization of Stormwater Response for the Tennessee Valley Using the Lag Modulus Concept,
W79-00447 5G

Factors Affecting the Quality of Urban Runoff in Four Watersheds Within the City of Knoxville, Tennessee,
W79-00456 5B

STRAIT OF GEORGIA (CANADA)
Regional Response to Forcing in Southern Strait of Georgia,
W79-00324 2L

STRAITS
On Geostrophic Adjustment in Sea Straits and Wide Estuaries. Part I: One-Layer System,
W79-00131 2L

Regional Response to Forcing in Southern Strait of Georgia,
W79-00324 2L

On Geostrophic Adjustment in Sea Straits and Wide Estuaries: Theory and Laboratory Experiments. Part II - Two-Layer System,
W79-00497 2L

STRATIFICATION
Field Investigation of Selective Withdrawal,
W79-00119 4A

STREAM INPUTS
Nature and Impact of Rural Stream Inputs on Water Quality,
W79-00483 5C

STREAMFLOW
Low-Flow Characteristics of Oklahoma Streams,
W79-00257 2E

Low-Flow Characteristics of Streams on the Olympic Peninsula, Washington,
W79-00258 2E

High-Flow Frequencies for Selected Streams in Oklahoma,
W79-00273 2E

Climate Change: Detection and Its Impact on Hydrologic Design,
W79-00492 2E

STREAMFLOW FORECASTING
Low-Flow Characteristics of Streams on the Olympic Peninsula, Washington,
W79-00258 2E

STREAMS
Stream Temperature Estimation Using Kalman Filter,
W79-00121 5B

Species Diversity Indices of the Fish Populations of Streams Draining Selected Test Areas on Eglin Air Force Base Reservation Florida,
W79-00277 7C

Longitudinal Dispersion of Fluid Particles in Mountain Streams: I. Theory and Field Evidence,
W79-00308 5B

Longitudinal Dispersion of Fluid Particles in Mountain Streams: 2. Similarity of the Mean Motion and Its Application,
W79-00309 5B

Nature and Impact of Rural Stream Inputs on Water Quality,
W79-00483 5C

Origin and Transport of Large Boulders in Mountain Streams,
W79-00490 2J

STREPTOCOCCUS
Recovery of Sanitary-Indicator Bacteria from Streams Containing Acid Mine Water,
W79-00444 5A

STRIP MINES
Influence of Strip Mines on Regional Ground-Water Flow,
W79-00118 5G

Remote Monitoring of Coal Strip Mine Rehabilitation,
W79-00226 5G

STRIP MINING
Our Reclamation Future: The Missing Bet on Trees,
W79-00086 4C

SUBMERGED JUMP
Pressure Fluctuations Beneath Submerged Jump,
W79-00316 8B

SUBMERGENCE
Pressure Fluctuations Beneath Submerged Jump,
W79-00316 8B

SUBSIDIES
Economic Analysis of Selected Features of Municipal Wastewater Construction Grant Legislation,
W79-00246 5G

SUBSURFACE FLOW
Stabilization of Earth Subsurface Layers,
W79-00035 8D

SUBSURFACE RUNOFF
A Field Evaluation of Subsurface and Surface Runoff, I. Tracer Studies,
W79-00115 2E

A Field Evaluation of Subsurface and Surface Runoff, II. Runoff Processes,
W79-00116 2E

SUCCESSION
Biocenosis of a High Mountain Stream Under the Influence of Tourism. 3. Attached Algae Communities in the Stream Rybi Potok (The High Tatra Mts, Poland) Polluted with Domestic Sewage,
W79-00220 5C

SUGAR INDUSTRY
Benthic Algae in a Pond After the Accumulation of Beet-Sugar Factory Wastes,
W79-00216 5C

Phytophilous Fauna in Ponds Fertilized with Sugar Factory Wastes,
W79-00217 5C

SUGARBEETS
Effect of Soil-Injected Ethylene on Sugarbeet (Beta Vulgaris L.) Yield Parameters,
W79-00296 3F

SULFATES
Analyses of Paper Machine Waters with Ion Specific Electrodes. Part IV. Sulfate Determination Using Pb(2+) Ion Specific Electrode and Various measurement Methods,
W79-00429 5A

SULFITE LIQUORS
Flame-Photometric Method for the Determination of Magnesium in Spent Liquors of Sulfite Pulp Mills (Plamennofotometricheskii method opredeleniya magniya v shchelokakh sul'fitnotsellyuloznogo proizvodstva),
W79-00415 5A

Energy Consumption for Electrodialysis of Spent Sulfite Liquors (Energozatraty na elektrodializ otrabotannogo shcheloka sul'fitnotsellyuloznogo proizvodstva),
W79-00416 5D

Electric Resistance of the Cation-Selective MK-40 Membrane During Electrodialysis of Spend Sulfite Liquor (Elektrosoprotivlenie kationoselektivnoy membrany MK-40 pri elektrodialze otrabotannogo sul'fitnogo shcheloka),
W79-00417 5A

SULFITE PULP MILLS
Development of an Effluent-Free Sulfite Pulp Mill (Entwicklung zur abwasserfrei arbeitenden Sulfitzellstoff-fabrik),
W79-00424 5D

SULFUR
Effect of Sulfur Deficiency on Water Regime and Intensity of Pea and Wheat Photosynthesis, (In Russian),
W79-00200 2I

Isotopic Composition of Sulfur in Precipitation Within the Great Lakes Basin,
W79-00339 5A

SULFUR BACTERIA
Control of Nuisance Odors from Ponds by the Use of Bacteria Cultures,
W79-00374 5D

SUPPLEMENTAL IRRIGATION
Ground-Water Availability in the Hitchcock-Red Willow, Frenchman Valley, and Meeker-Driftwood Irrigation Districts, Southwest Nebraska,
W79-00260 4B

SURFACE-GROUNDWATER RELATIONSHIPS
Ground-Water Availability in the Hitchcock-Red Willow, Frenchman Valley, and Meeker-Driftwood Irrigation Districts, Southwest Nebraska,
W79-00260 4B

SURFACE RUNOFF
A Field Evaluation of Subsurface and Surface Runoff, I. Tracer Studies,
W79-00115 2E

A Field Evaluation of Subsurface and Surface Runoff, II. Runoff Processes,
W79-00116 2E

SURFACE WATER
Water Resources Data for Wisconsin, Water Year 1977.
W79-00267 7C

SURFACE WATERS
Hydrogeologic Reconnaissance of the Mekong Delta in South Vietnam and Cambodia,
W79-00255 7C

Water Resources Data for Pennsylvania, Water Year 1977--Volume 2. Susquehanna and Potomac River Basins.
W79-00265 7C

Water Resources Data for Pennsylvania, Water Year 1977--Volume 1. Delaware River Basin.
W79-00266 7C

Water Resources Data for Pennsylvania, Water Year 1977--Volume 3. Ohio River and St. Lawrence River Basins.
W79-00268 7C

Forms of Trace Elements in Soils, Sediments, and Associated Waters: An Overview of Their Determination and Biological Availability,
W79-00271 5B

Water-Resources Appraisal of the Wet Mountain Valley, in Parts of Custer and Fremont Counties, Colorado,
W79-00274 4B

SURVEYING INSTRUMENTS
Remote Monitoring of Coal Strip Mine Rehabilitation,
W79-00226 5G

SURVEYS
Quantitative Comparison of Seining and Underwater Observation for Stream Fishery Surveys,
W79-00072 7B

Electrical-Resistivity Surveys for Groundwater in the Deccan Trap Country of Sangli District, Maharashtra,
W79-00107 4B

The Demand for Clean Water: The Case of the Charles River,
W79-00234 6B

Chemistry of Small Norwegian Lakes, with Special Reference to Acid Precipitation,
W79-00321 5A

SUSPENDED SOLIDS
Dynamics and Control of Suspended Solids in a Two-Step Activated Sludge Plant,
W79-00352 5D

EPA's Goal for Suspended Solids is Not Met with Media Filtration,
W79-00414 5D

Control of Water Residence Time in Small Reservoirs,
W79-00482 4A

SUSQUEHANNA RIVER BASIN
Water Resources Data for Pennsylvania, Water Year 1977--Volume 2. Susquehanna and Potomac River Basins.
W79-00265 7C

SWAB MATERIALS
B. R. /Hanson ;I. A. /Schipper

A Method of Measuring Bacterial Growth in Aquatic Environments Using Dialysis Culture,
W79-00109 5A

EXAS TECH UNIV., LUBBOCK. DEPT. OF LANT AND SOIL SCIENCE.
Stomatal and Nonstomatal Regulation of Water Use in Cotton, Corn and Sorghum,
W79-00016 2I

Water Relations and Physiological Activity of Potatoes,
W79-00017 2I

EXAS UNIV. AT AUSTIN, PORT ARANSAS. ORT ARANSAS MARINE LAB.
The Effect of Naphthalene on Survival and Activity of the Amphipod Parhyale,
W79-00081 5C

HESSALONIKI UNIV., SALONIKA (GREECE). ACULTY OF TECHNOLOGY.
On the Two-Dimensional Groundwater Movement,
W79-00108 2F

IFLIS INST. OF FORESTRY (USSR).
Changes in Water Regime of Brown Forest Soils of the Georgian SSR Under the Effect of Silvicultural Practices. (In Russian).
W79-00401 4C

OKYO UNIV., TOKYO (JAPAN).
Sludge Treatment by Supersonic Jet-Flame,
W79-00403 5E

ORO CO., SAN MARCOS, CA. (ASSIGNEE).
Angularity Sensor Means for Center Pivot Irrigation System,
W79-00023 3F

SENTRALNYI GOSUDARSTVENNYI AUCHNO-ISSLEDOVATELSKII INST. ZERNOGO I RECHNOGO RYBNOGO HOZYAISTVA, BAKU (USSR). AZERBAIJAN RANCH.
Survival and Oxygen Consumption of Young Kura Carp Under Various Keeping Conditions (In Russian),
W79-00180 2H

ULSTER COLL. NORTHERN IRELAND POLYTECHNIC, JORDANSTOWN.
Momentum Transfer in a Compound Channel,
W79-00334 8B

UNION CARBIDE CORP., SISTERSVILLE, WV.
UNOX Wastewater Treatment System Performance Silicone Chemical Complex,
W79-00349 5D

UNION CARBIDE CORP., SOUTH CHARLESTON, WV.
The UNOX Process: Effective Wastewater Treatment Practice,
W79-00347 5D

UNIVERSAL OIL PRODUCTS, INC., SAINT PAUL, MN. JOHNSON DIV.
Water Usage Requires Planning,
W79-00183 6D

UNIVERSIDAD NACIONAL AUTONOMA DE MEXICO, MEXICO CITY. DEPT. OF INGENIERA.
Eddy Production Inside Wall Layers,
W79-00333 8B

UNIVERSIDAD NACIONAL AUTONOMA DE MEXICO, MEXICO CITY. INST. DI BIOLOGIA.
Study of the Fishes of the Lagoon of Alvarado, Veracruz, Mexico (In Spanish),
W79-00079 2L

UNIVERSITY OF MANCHESTER INST. OF SCIENCE AND TECHNOLOGY (ENGLAND). DEPT OF CIVIL AND STRUCTURAL ENGINEERING.
Pressure Fluctuations Beneath Submerged Jump,
W79-00316 8B

UNIVERSITY OF NEW ENGLAND, ARMIDALE (AUSTRALIA). DEPT. OF GEOGRAPHY.
Local Differences in the Patterns of Variability of Tropical Rainfall: Some Characteristics and Implications,
W79-00113 2B

UNIVERSITY OF SOUTH FLORIDA, TAMPA. DEPT. OF BIOLOGY.
The Photosynthetic and Respiratory Rates and Tolerances of Benthic Algae from a Mangrove and Salt Marsh Estuary: A Comparative Study,
W79-00204 5C

UNIVERSITY OF SOUTHERN MISSISSIPPI, HATTIESBURG. COLL. OF BUSINESS ADMINISTRATION.
A Study of Coastal Pollution and Agency Interface,
W79-00389 5G

UNIVERSITY OF WEST FLORIDA, PENSACOLA. FACULTY OF BIOLOGY.
Toxicity of Sodium Pentachlorophenate (NA-PCP) to the Grass Shrimp, Palaemonetes Pugio, at Different Stages of the Molt Cycle,
W79-00078 5C

UPPSALA UNIV. (SWEDEN). INST. OF ZOOPHYSIOLOGY.
Adaptations and Resistance to Anoxia in Cloeon Dipterum (Ephemeroptera) and Nemoura Cinerea (Plecoptera),
W79-00076 5G

UTAH STATE UNIV., LOGAN. DEPT. OF BIOLOGY.
Report of a Dematiaceous Hyphomycete from the Great Salt Lake, Utah,
W79-00297 2H

A Procaryotic Intracellular Symbiont of the Great Salt Lake Brine Shrimp Artemia Salina (L.),
W79-00298 2H

UTAH WATER RESEARCH LAB., LOGAN.
WASOPT Users Manual: An Integer Programming Methodology for Municipal/Regional Water Supply Planning,
W79-00002 6A

Preliminary Identification of the Salt Pick-up and Transport Processes in the Price River Basin, Utah,
W79-00145 3C

VALMET OY, JYVASKYLA (FINLAND).
Analyses of Paper Machine Waters with Ion Specific Electrodes. Part IV. Sulfate Determination Using Pb(2-) Ion Specific Electrode and Various measurement Methods,
W79-00429 5A

VERSAR, INC., SPRINGFIELD, VA.
A First Order Mass Balance Model for the Sources Distribution and Fate of PCBs in the Environment,
W79-00289 5B

Assessment of the Environmental Impacts on the Ban on Imports of PCBs,
W79-00290 5G

VICTORIA UNIV. (BRITISH COLUMBIA). DEPT. OF GEOGRAPHY.
Water Administration in England and Wales Impacts of Reorganization,
W79-00384 6E

VIRGINIA HIGHWAY AND TRANSPORTATION RESEARCH COUNCIL, CHARLOTTESVILLE.
Water Reuse at Highway Rest Areas: Evaluation Phase,
W79-00087 5D

VIRGINIA POLYTECHNIC INSTITUTE AND STATE UNIVERSITY, BLACKSBURG, VA. AGRICULTURAL ENGINEERING DEPARTMENT.
A Model for Evaluating the Effect of Land Uses on Flood Flows,
W79-00450 4C

VYSKUMNY USTAV RASTLINNEJ VYROBY, PIESTANY (CZECHOSLOVAKIA).
Relationships Among Some Physical Properties of Soil (In Slovenian),
W79-00451 2G

WARSAW UNIV. (POLAND). DEPT. OF ENVIRONMENTAL MICROBIOLOGY.
The Effect of Cyclohexane Derivatives on Selection of Bacterial Groups Forming Activated Sludge Microflora,
W79-00159 5D

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF ZOOLOGY.
Impacts of Impoundment to Vertebrate Animals and their Habitats in the Snake River Canyon, Washington,
W79-00146 6G

WASHINGTON UNIV., SEATTLE.
The Development of the Electrical Power System in the Pacific Northwest. A Public Policy Perspective,
W79-00143 6E

Regional Electric Energy Planning: A Case Study in the Politics of Scarce Resources,
W79-00144 6E

WASHINGTON UNIV., SEATTLE. DEPT. OF CIVIL ENGINEERS.
Climate Change: Detection and Its Impact on Hydrologic Design.
W79-00492 2E

WASHINGTON UNIV., SEATTLE. DEPT. OF OCEANOGRAPHY.
Continuous Culture of Marine Diatoms Under Silicon Limitation. 3. A Model of Si-Limited Diatom Growth.
W79-00229 5C

WASHINGTON UNIV., SEATTLE. FISHERIES RESEARCH INST.
Seasonal Changes in Respiratory Enzyme Activity and Productivity in Lake Washington Microplankton.
W79-00212 5C

WASTE RESEARCH UNIT, OXON (ENGLAND). HARWELL LAB.
Adsorption of Some Toxic Substances by Waste Components.
W79-00152 5B

WATER POLLUTION RESEARCH LAB., STEVENAGE (ENGLAND).
Textile Waste Waters: Treatment and Environmental Effects.
W79-00166 3E

WATERLOO UNIV. (ONTARIO). DEPT. OF GEOGRAPHY.
An Analysis of Criticisms of International Fishery Organizations with Reference to Three Agencies Associated with the Canadian West Coast Fishery.
W79-00394 6E

WATERLOO UNIV. (ONTARIO). DEPT. OF SYSTEMS DESIGN.
A General Two Dimensional River Simulator.
W79-00397 2E

WEST VIRGINIA UNIV., MORGANTOWN.
Studies of Ion Exchange and Chelation Compounds Adsorbed on Granular Graphite.
W79-00431 5D

Continuous Electrochemical Synthesis Using a Packed Granular Electrode.
W79-00432 5D

Distribution of Heterotrophic and Nitrifying Bacteria Within the Aerobic-Media Trickling Filter.
W79-00433 5D

Recovery of Sanitary-Indicator Bacteria from Streams Containing Acid Mine Water.
W79-00444 5A

Aerobic Media Trickling Filter Applied to Nitrogen Control.
W79-00445 5D

A Study for Improving the Aerobic-Media Trickling Filter.
W79-00457 5D

WEST VIRGINIA UNIV., MORGANTOWN. DEPT. OF CHEMICAL ENGINEERING.
Total Phosphorus Transport During Storm Events.
W79-00478 5B

WESTERN ILLINOIS UNIV., MACOMB.
Musculium Transversum in the Illinois River and an Acute Potassium Bioassay Method for the Species.
W79-00413 5C

WEYERHAEUSER CO., SPRINGFIELD, OR.
Steam Stripping Reduce Condensate at Weyco Mill
W79-00409 3E

WISCONSIN UNIV.-MADISON. CENTER FOR RESOURCE POLICY STUDIES.
Property Rules, Liability Rules, and Environmental Economics.
W79-00241 6E

WISCONSIN UNIV.-MADISON, DEPT. OF AGRICULTURAL ECONOMICS.
Distributional Implications of the Extended Economic Zone: Some Policy and Research Issues in the Fishery.
W79-00236 6E

WISCONSIN UNIV.-MADISON. DEPT. OF METEOROLOGY.
On Geostrophic Adjustment in Sea Straits and Wide Estuaries. Part I: One-Layer System.
W79-00131 2L

WISCONSIN UNIV.-MADISON. DEPT. OF METEOROLOGY; AND WISCONSIN UNIV.-MADISON. MARINE STUDIES CENTER.
On Geostrophic Adjustment in Sea Straits and Wide Estuaries: Theory and Laboratory Experiments. Part II - Two-Layer System.
W79-00497 2L

WISCONSIN UNIV.-MADISON. DEPT. OF SOIL SCIENCE.
Steady Infiltration from Single and Periodic Strip Sources.
W79-00471 2G

WOLLONGONG UNIV. (AUSTRALIA). DEPT. OF CHEMISTRY.
Recovery of Tin from Electroplating Solutions and Rinse Waters.
W79-00157 5D

WOOD (WILLIAM S.) AND ASSOCIATES, WEST CHESTER, PA.
Safety Aspects of Toxic and Hazardous Spills.
W79-00345 5G

WOODBINE CORP., FORT WORTH, TX. (ASSIGNEE).
Stabilization of Earth Subsurface Layers.
W79-00035 8D

YAROSLAVSKII GOSUDARSTVENNYI PEDAGOGICHESKII INST. (USSR).
Effect of Environmental Factors on the Distribution of Caddis Fly Larvae in Small Rivers (In Russian).
W79-00147 2I

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 12, NUMBER 2
JANUARY 15, 1979

W79-00501 -- W79-01000
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 2
JANUARY 15, 1979

W79-00501 -- W79-01000

he Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the ransaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SECOND ROW MOLECULAR ORBITAL CALCULATIONS MINIMAL AND MINIMAL +3D BASIS CALCULATIONS ON SECOND ROW DIATOMICS,
North Dakota State Univ., Fargo. Dept. of Chemistry.
F. J. Marsh, and M. S. Gordon.
Chemical Physics Letters. Vol. 45, No. 2, p 255-260, January 15, 1977. 5 tab, 24 ref. OWRT A-045-NDAK(1), 14-34-0001-6035.

Descriptors: *Mathematical models, *Molecular structure, Equilibrium, *Diatomic molecules, *Diapole moments, Bond length(Atoms).

The optimal valence orbital exponents of a series of 24 diatomic molecules containing second row atoms are determined, with and without 3d orbitals in the basis set. Equilibrium bond lengths and dipole moments are calculated using Slater exponents as well as the optimal values. Optimization of valence s and p exponents is as important as the addition of d orbitals to the basis set for bond length predictions. Separate optimization of d exponents does not significantly improve calculated bond lengths. The computed dipole moments are less satisfactory for all basis sets, although the optimal exponent basis including d orbitals are in best overall agreement with experiment.
W79-00681

DENSITY MAXIMA IN HIGH-PRESSURE SUPERCOOLED WATER AND LIQUID SILICON DIXOIDE,
Purdue Univ., Lafayette, IN. Dept. of Chemistry.
C. A. Angell, and H. Kanno.
Science, Vol. 193, p 1121-1122, September 1976, 2 fig, 16 ref. OWRT B-051-IND(10).

Descriptors: *Supercooling, *High pressure, *Nucleation, Deuterium, Crystallization, Physical properties, Density, Thermal properties, *Temperature of Maximum Density, *Nucleation temperature.

With glass capillary pressure vessels it has been possible to study the effect of pressure on the temperature of maximum density (TMD) and on the 'sharpness' of the density maximum in liquid H2O and D2O in the important but little-studied supercooled regime. A pressure of 1200 bars produces a 33 degree C depression of the TMD in these liquids and a considerable reduction in sharpness. Comparison with the rather flat density maximum for liquid SiO2 supports the notion that the presence or absence of density anomalies in 'tetrahedral' liquids depends on the average bridge-pond angle, which is evidently unusually large in water at normal pressure.
W79-00864

ISOTHERMAL COMPRESSIBILITY OF SUPERCOOLED WATER AND EVIDENCE FOR A THERMODYNAMIC SINGULARITY AT -45 DEGREES C,
Purdue Univ., Lafayette, IN. Dept. of Chemistry.
R. J. Speedy, and C. A. Angell.
The Journal of Chemical Physics, Vol. 65, No. 3, p 851-858, August 1976, 5 fig, 1 tab, 32 ref. OWRT B-051-IND(9).

Descriptors: *Supercooling, *Compressibility, Hydrogen bonding, Water properties, *Supercooled water, *Isothermal compressibility.

Using a capillary technique for small samples, the isothermal compressibility kappa tau of water has been measured to -26 degrees C. Accelerating increases of kappa tau at the lower temperatures can be described by an expression of the form kappa tau = alpha episilon gamma (where episilon = (T - Ts)/Ts), which is known to describe anomalies encountered in the vicinity of a thermodynamic singularity located at Ts. The implications that the thermodynamic and certain other properties of water at lower temperatures may be decomposed into a normal component and an anomalous component which diverges at Ts = -45 degrees C is supported by analysis of numerous other thermodynamic and relaxation data which extend into the supercooled regime. The anomalous characteristics are shown to originate primarily in the sensitivity of the volume to temperature changes, suggesting a geometrical basis for the cooperative behavior. The singularity at Ts = -45 degrees C may be a lambda transition associated with the cooperative formation of an open hydrogen-bonded network, but the near coincidence of Ts with the experimental homogeneous nucleation temperature suggests, as an alternative, that Ts may correspond to the limit of mechanical stability for the supercooled liquid phase.

2. WATER CYCLE

2A. General

DEVELOPMENT OF COMPUTER PROGRAM FOR LINEARIZED SUBHYDROGRAPHS METHOD FOR URBAN RUNOFF DETERMINATION,
Akron Univ., OH. Dept. of Civil Engineering.
S. Sarikelle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 300, Price codes: A08 in paper copy, A01 in microfiche. Ohio Water Resources Center, Columbus, Completion Report, November 1977. 148 p, OWRT A-052-OHIO(1).

Descriptors: *Hydrologic models, *Runoff, *Surface runoff, *Computer models, *Storm runoff, Hydraulics, Hydrology, *Stormwater management, *Hydrograph simulation, Urban drainage.

A model for the simulation of urban runoff based on Linearized Subhydrographs Method of Urban Runoff Determination is developed for the planning and analysis of converging stormwater drainage systems in small and large urban areas. The model simulates hydrographs for both continuously recorded rainstorm events and synthetic design hyetographs. The model is applied to various urban watersheds with differing land use characteristics utilizing recorded hyetographs. The simulated hydrographs are then compared to recorded hydrographs. The results indicate that when single event hyetographs are utilized, the simulated hydrographs for both the inlet and pipe conditions compare well to those results obtained from measured values. The model structure and input requirements needed for the utilization of the program are presented. The limitations of the model are examined, and future research to improve this method is included.
W79-00526

MODELING OF HYDRAULIC SYSTEMS BY FINITE-ELEMENT METHODS,
Geological Survey, Menlo Park, CA. Water Resources Div.
R. T. Cheng.
In: Advances in Hydroscience, Vol 11, Academic Press Inc., New York, p 207-284, 1978. 25 fig, 2 tab, 121 ref.

Descriptors: *Model studies, *Hydraulic systems, *Finite element analysis, *Numerical analysis, Groundwater movement, Lakes, Waves(Water), Evaluation, *Rayleigh-Ritz method, *Galerkin procedures.

The state of the art of the finite-element technique is reviewed. Both the Rayleigh-Ritz and Galerkin procedures are discussed in detail and their equivalences and differences are shown. Emphasis is placed on the finite-element modeling and solution techniques when applied to hydrologic systems. Using examples of subsurface and surface hydrologic problems, the principles, techniques and applications of the finite-element methods are demonstrated. (Woodard-USGS)
W79-00634

A MOISTURE-ACCOUNTING WATERSHED MODEL FOR SINGLE-STORM EVENTS BASED ON TIME-AREA CONCEPT,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
R. Krzysztofowicz, and M. H. Diskin.
Journal of Hydrology, Vol. 37, 1978, p 261-294. 7 tab, 12 fig, 15 ref.

Descriptors: *Model studies, *Hydrographs, *Rainfall-runoff relationships, Storms, Simulation analysis structural models, Analytical techniques, Climatic data, Theoretical analysis, Depth-area-duration analysis.

A model is presented in which a total hydrograph is derived from a single storm. The model is formulated upon two principles: (1) a single lumped input system is impractical when representing a storm which contains variability of rainfall. Consequently, it is necessary to divide the area into smaller zones of uniform rainfall input. (2) Since total rainfall input is divided into surface runoff, base flow runoff and losses based upon the moisture content of the upper soil layer, accounting procedures must be incorporated into the model. Procedures for identifying model parameters are demonstrated using the Raba River in Southern Poland. Calibration results and sensitivity analysis demonstrate the usefulness of the model. Because of this model's ability to account for rainfall variability it should be particularly valuable in the arid regions of the world where rainfall variation is characteristic. (Tickes-Arizona)

AVAILABILITY OF ATMOSPHERIC WATER,
Rhodesia Dept. of Meteorological Service, Salisbury.
J. D. Torrance.
Transactions of the Rhodesian Scientific Association, Vol. 56, No. 2, p 31-45, 1975. 6 fig, 6 tab, 1 ref.

Descriptors: *Rainfall, *Moisture content, *Atmosphere, *Model studies, Mathematical models, Computer models, Precipitation(Atmospheric), Cloud physics, Cloud seeding, Weather modification, Meteorology, *Rhodesia.

A study was undertaken to investigate the relationships between atmospheric moisture and rainfall. It was found that: (1) there is a rather small interseasonal variation in totals of precipitable water, compared with the corresponding variation in rainfall; (2) there is a good agreement between interseasonal totals of precipitable water on raindays only, and rainfall totals; (3) there is good agreement between precipitable water and rainfall index; (4) on daily values, there is a general increase in the amount of rain as the precipitable water total increases; but dry days can still occur with any value of precipitable water; (5) high values of precipitable water are then a necessary, but not by themselves sufficient, condition for conversion of atmospheric moisture into rainfall. Computer modeling was used to show that the quantity of water vapor used by a thunderstorm is comparable with that held by the atmosphere per unit area. It was shown that even periods of heavy widespread rain do not deplete the reserves of moisture held in the atmosphere excessively, and it was clear that cloud-seeding activities are not likely to utilize more than a small proportion of the water vapor available in the air. There need be no concern that cloud seeding will deprive any area of its rightful share of the atmospheric moisture. (Sims-ISWS)

HARVEST DATES IN ANCIENT MESOPOTAMIA AS POSSIBLE INDICATORS OF CLIMATIC VARIATIONS,
Hebrew Univ., Jerusalem (Israel). Dept. of Atmospheric Sciences.
J. Neumann, and R. M. Sigrist.
Climatic Change, Vol. 1, No. 3, p 239-256, 1978. 2 tab, 2 fig, 52 ref.

Descriptors: *Paleoclimatology, *Bioindicators, *Paleohydrology, *Climatology, Arid climates, History, Meteorological data, Regional analysis, Agroclimatology, Crop response, Harvesting, Seasonal, Near East, Rainfall, Weather patterns.

Climatic development and change in the Near East including Mesopotamia since 2500 B.C. was first studied by Butzer in 1958 and has been the subject of several more recent studies. The basis for these studies is that in mediterranean type climate such as that in the Near East a negative correlation can be made between winter temperatures and seasonal rainfall. Many of these studies have agreed upon the speculation that a period of increased aridity began in this area about 2500 B.C. and was followed by a period of higher rainfall beginning about 850 B.C. The purpose of this study was to check these speculations based upon the examination of clay tablet inscriptions from ancient Babylonia that provided information about the dates of Barley harvest for two perods: 1800 B.C. to 1625 B.C. and 600-400 B.C. These tablets tell us that in the earlier period, harvest began late in March or early in April, while in the latter period it began late in April or in May, a Significant difference of a month or more. Presently, harvests in the Near East begin in the second half of April. These differences, too large to be caused by varietal change, support the speculation that the earlier period experienced a warmer more dry climate and the later period a cooler and more humid climate that is present today. A FLASH FLOOD AID - THE LIMITED AREA QPF,
National Weather Service, Fort Worth, TX. Southern Region.
J. Belville, G. A. Johnson, and J. D. Ward.
NOAA Technical Memorandum NWS SR-97, March 1978. 13 p, 2 fig, 3 tab, 21 ref, append.

Descriptors: *Flood forecasting, *Forecasting, *Rainfall, *Flash floods, *Texas, Quantitative Precipitation Forecast(QPF).

The Quantitative precipitation Forecast (QPF) shows the areal distribution and the amount of rainfall expected to occur over agiven period of tie. The most important facet of the QLPF is that it alerts the forecasters to the potential for excessive rains. The WSFO Lubbock QLPF procedures were developed primarily to indicate the maximum amount of precipitation expected within an area. Parameters investigated were climatology, certain 500 mb flow patterns, and five atmospheric variables which had been found t correlate well with episodes of heavy rain. These variables were lifted index, K-index, mean relative humidity (surface to 500 mb), tropopause temperatures, and precipitable water. Other variables, such as surface dew points and windsa aloft, may be incorporated into the program in the future; but the program should be kept simple and relatively easy for the forecasters to use.(NOAA)

EFFECTS OF PERMAFROST ON STREAM CHANNEL BEHAVIOR IN ARCTIC ALASKA,
Geological Survey, Laguna Niguel, CA. Water Resources Div.
K. M. Scott.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price $1.20. Professional Paper 1068, 1978. 19 p, 11 fig, 2 tab, 38 ref.

Descriptors: *Channel erosion, *Scour, *Permafrost, *Ice breakup, *Alaska, Streams, Drainage area, Floods, *Arctic Coastal Plain.

Sites with drainage areas ranging from 88 to 12,200 sq km were monitored on five streams in northern Alaska during the breakup in 1976 to determine (1) the effects of frozen bed and bank material on channel behavior, and (2) the importance of the annual breakup flood in forming the channels of arctic streams. The thawing and concomitant erosion of channels varied with changes in bed-material size, channel pattern, drainage area, and climate. The response of channels to breakup flooding ranged from total permafrost control of channel processes, including both bed scour and lateral erosion, to only brief restriction of channel behavior early in the rise of the flooding. The watershed characteristic that appears to explain much of this variation is size of drainage area. (Woodard-USGS)

THERMAL STRESS NEAR THE SURFACE OF A GLACIER,
British Antarctic Survey, Cambridge (England).
Journal of Glaciology, Vol. 20, No. 83, p 257-283, 1978. 15 fig, 1 tab, 47 ref.

Descriptors: *Glaciers, *Ice, *Thermal stress, *Model studies, Temperature, Theoretical analysis, Analytical techniques, Cracks, Analysis, Thermal expansion, On-site data collections, Mathematical models, Stress analysis, Strain, Firn, Snow, *Barnes Ice Cap.

Stresses occur in the uppermost 10 m of a glacier as a result of temperature fluctuations at the surface. A model was set up of a typical year's surface temperature variation, and the progress of temperature waves through the glacier was calculated using Fourier theory of heat conduction. Short-period fluctuations are attenuated rapidly, and at 10 m depth the annual cycle is reduced to 5% of its surface amplitude. As the temperature of the ice varies, it undergoes small volume changes; stresses were calculated on the assumption that any tendency of the ice to expand or contract laterally results in the creation of just enough stress to cause the ice to remain unstrained. It was found that in the top 2 or 3 m, stresses of thermal origin are generally in excess of those due to gross deformation or overburden pressure. For the case of high-density ice, Glen's flow law was used, and conditions were found to be favorable for the formation of surface rumples of wavelength about 10 m. For the case of firn or snow, a Newtonian flow law was assumed, and it was found that under cold conditions, fracture under tension can occur. Cracks of thermal origin may be responsible for the initial formation of crevasses, and they also provide an explanation for background noise encountered when seismic shooting at low temperatures. Calculations were made of the strain-rate field surrounding a crack, and it was found that thermal effects can lead to appreciable strain-rate anomalies for strain-rate measurements near cracks. The magnitude of the effect is easily sufficient to account for anomalous fluctuating strain-rates found when using wire strainmeters on the Barnes Ice Cap. (Humphreys-ISWS)

ORIGIN OF FOLIATION IN GLACIERS,
Minnesota Univ., Minneapolis. Dept. of Geology and Geophysics.
R. L. Hooke, and P. J. Hudleston.
Journal of Glaciology, Vol. 20, No. 83, p 285-299, 1978. 4 fig, 45 ref. NSF GA-42728, EAR 74-12293-A02.

Descriptors: *Glaciers, *Glaciology, *Structural behavior, Ice, Model studies, Movement, Leaves, Homogeneity, Physical properties, Theoretical analysis, Mathematical models, Bubbles, Structural analysis, Distribution patterns, Spatial distribution, *Foliation.

Laboratory studies suggested that neither bubbles nor dirt particles migrate rapidly enough in glacier ice to be responsible for the alternating layers of bubbly and clear ice or dirty and clean ice which constitute foliation. It was suggested that these variations in bubble or dirt content are inherited from primary inhomogeneities such as may occur in sedimentary stratification in the accumulation region, in crevasse fillings, or during debris entrainment at the base of the glacier: the appearance of these inhomogeneities is later modified by strain during flow to produce foliation. The authors considered 6 types of inhomogeneity, or components of foliation, and they showed that, at the very large total strains expected in glaciers, all are eventually flattened, stretched out, and rotated to form a layered structure roughly perpendicular to the direction of maximum total shortening. Most characteristics of observed foliation can be explained by this hypothesis. For example, in the marginal zones of polar ice sheets, the rapid decrease in dip of foliation with depth and with distance up-glacier from the margin can be explained by a model in which the foliation is assumed to be nearly parallel to the base of the glacier some distance from the margin and is deformed passively with the ice thereafter. However, some observations of cross-cutting foliations may require localized inhomogeneous shear parallel to the 'new' foliation. (Humphreys-ISWS)
W79-00687

SURFACE MASS-BALANCE VARIABILITY NEAR 'BYRD' STATION, ANTARCTICA, AND

ITS IMPORTANCE TO ICE CORE STRATIGRAPHY,
Ohio State Univ., Columbus. Dept. of Geology and Mineralogy; and Ohio State Univ., Columbus. Inst. of Polar Studies.
I. M. Whillans.
Journal of Glaciology, Vol 20, No 83, p 301-310, 1978. 5 fig, 22 ref.

Descriptors: *Ice, *Antarctic, *Surfaces, *Stratigraphy, Snowpacks, Movement, Analysis, On-site tests, Variability, Analytical techniques, Oxygen isotopes, Glaciology, *Byrd Station(Antarctica), Mass balance.

The local variability in surface mass balance (net snow accumulation) up-glacier from 'Byrd' station, Antarctica, is due to the combined effects of year-to-year 'climate' variations and of the surface microrelief due to snow drifts and sastrugi. These variabilities are consistent with the variability in surface mass balance obtained from core stratigraphy. The variabilities were used in a discussion of the difficulties encountered with the deep 'Byrd' station core in detecting annual layering by the stable oxygen-isotope ratio and the microparticle concentration techniques. The recognition of annual layers by these techniques requires that the snows of certain seasons be present in the measured section; but near 'Byrd' station, the microrelief is such that summer snow layers are not horizontally continuous and may be absent from a given section. At other sites on ice sheets, where the microrelief is less (less wind activity) or where the surface mass balance is larger, or both, less difficulty is anticipated in using the stable oxygen-isotope ratio and microparticle-concentration techniques to identify annual layers. (Humphreys-ISWS)
W79-00688

THE SPATIAL DISTRIBUTION OF 10 M TEMPERATURES IN THE ANTARCTIC PENINSULA,
British Antarctic Survey, Cambridge (England).
P. J. Martin, and D. A. Peel.
Journal of Glaciology, Vol 20, No 83, p 311-317, 1978. 3 fig, 1 tab, 19 ref.

Descriptors: *Ice, *Antarctic, *Glaciers, *Temperature distribution, Temperature, Spatial distribution, Boreholes, Data collections, Air temperature, Correlation analysis, Climatic data, Air temperature.

Temperatures from 10 m bore holes were analyzed to determine the spatial variation of mean annual surface temperature over the Antarctic Peninsula. In general, there is a decrease in temperature of 0.84 deg per degree latitude southwards combined with an altitude lapse rate of 0.68 deg per 100 m. There is a sharp divide between the continental type climate of the east coast and a maritime climate of the central and western regions. Temperatures are approximately 7 deg lower along the east coast compared with those at sites of a similar altitude and latitude on the west. (Humphreys-ISWS)
W79-00689

ORIGIN OF THE BASAL ICE LAYER FROM ALPINE GLACIERS INDICATED BY ITS CHEMISTRY,
Brussels Univ. (Belgium). Lab. de Geomorphologie.
R. A. Souchez, and R. D. Lorrain.
Journal of Glaciology, Vol 20, No 83, p 319-328, 1978. 4 fig, 3 tab, 20 ref.

Descriptors: *Glaciers, *Ice, *Glaciology, *Geochemistry, Alpine, Calcium, Lead, Sodium, Potassium, Magnesium, Chemical analysis, On-site data collections, Sampling, Cations, Lead radioisotopes, Stratigraphy, Foreign countries, Foreign research, *Switzerland, *Glacier de Tsanfleuron(Switzerland), *Glacier d'Argentiere'(Switzerland), Basal ice.

The basal ice layer of Alpine glaciers, the thickness of which can reach more than 1 m, generally appears as a sequence composed of layers of bubble-poor ice 0.5-3 cm thick and dirt layers containing dispersed rock fragments. Locally, debris-free bubbly ice is also present in the sequence. This basal layer exists on the lee side of rock protuberances or along the marginal part of the glacier. Three geochemical characteristics shed some light on its origin: (1) The high calcium content of basal ice sliding over limestones from the north side of Glacier de Tsanfleuron can be predicted successfully from considerations of the phase relations in regelating subglacial solutions in approximate equilibrium with subglacial calcite deposits. (2) The (Na + K)/(Ca + Mg) ratio of bubble-poor basal ice from Glacier de Tsijiore Nouve which flows over gneissic rocks is significantly higher than this ratio in other samples taken in the same environment (glacier ice, melt water). This may be explained by refreezing of squeezed water, the ionic composition of which is governed by selective diffucion of ions during squeezing and/or by the water being forced through mud layers as demonstrated by us at the base of Glacier d'Argentiere. (3) The Lead-210 activity per kg of basal ice from the south side of Glacier de Tsanfleuron is greater than that of the glacier ice immediately above, which indicates that it is younger despite percolation effects. This can be explained if recent ice accretion has occurred at the base of relatively old glacier ice. Accretion of blowing snow has been found to occur under the southern margin of the glacier. DETERMINATION OF THE MEAN NUMBER OF BONDS PER SNOW GRAIN AND OF THE DEPENDENCE OF THE TENSILE STRENGTH OF SNOW ON STEREOLOGICAL PARAMETERS,
Eidgenossische Inst. fur Schnee- und Lawinenforschung, Davos (Switzerland).
H. Gubler.
Journal of Glaciology, Vol 20, No 83, p 329-341, 1978. 10 fig, 1 tab, 10 ref.

Descriptors: *Snow, *Tensile strength, *Mathematical models, Physical properties, Theoretical analysis, Density, Mechanical properties, Model studies, Analytical techniques, Laboratory tests, *Snow structure, Snow grains, Density distribution, Grain bonds.

A theoretical density distribution of the number of bonds per grain as a function of the mean number of bonds per grain was derived from the assumption of a randomness and isotropy of grain and grainbound location and orientation. The knowledge of the theoretical density distribution allows the determination of the effective distribution parameters from section planes or thin sections. The concept of the fundamental unit to describe the strength of snow was introduced. Structural parameters developed on the basis of the fundamental units show improved correlations with the tensile strength. (Humphreys-ISWS)
W79-00691

AN ALTERNATE STATISTICAL INTERPRETATION OF THE STRENGTH OF SNOW,
Eidgenoessiche Inst. fur Schnee- und Lawinenforschung, Davos (Switzerland).
H. Gubler.
Journal of Glaciology, Vol 20, No 83, p 343-357, 1978. 10 fig, 1 tab, 12 ref.

Descriptors: *Snow, *Strength, *Mechanical properties, *Statistical models, Ductility, Model studies, Mathematical models, Statistical methods, Analytical techniques, Distribution patterns, Cracks, Analysis, Foreign research, Brittle strength.

The basic features of the statistical models to describe brittle and ductile strength of snow were outlined and discussed. The concept of the 'fundamental unit' was introduced. The models were applied to estimate the development of slab stability during heavy snowfalls and to simulate measurements of the tensile strength of snow using the centrifugal method as a function of the load rate. The models developed were compared with Sommerfeld's applications of statistical methods to estimate the strength of snow in the starting zone of a slab avalanche. Statistical models to estimate the strength of snow together with consistent definitions of the fundamental unit may lead to a better understanding of brittle and ductile strength of snow in terms of structural or stereological parameters. DIELECTRIC BEHAVIOUR OF DISPERSE ICE MICROCRYSTALS IN THE FREQUENCY RANGE 100,000 TO 0.01 HZ,
Laboratoire de Thermodynamique des Etats Metastables et de Physique Moleculaire, Pau (France).
C. Lafargue, S. Bourgeois, and G. Evrard.
Journal of Glaciology, Vol 20, No 83, p 359-365, 1978. 5 fig, 2 tab, 6 ref.

Descriptors: *Ice, *Laboratory tests, *Activation energy, Heating, Electromagnetic waves, Temperature, Frequency, Melting, Dispersion, Analysis, Testing procedures, *Dielectric properties, Microcrystals, Polycrystalline ice.

Dielectric properties of ice microcrystals were studied in the frequency range 300,000 to 0.01 Hz. Two separated dispersions were revealed: the Debye dispersion of ice and another dispersion at very low frequencies. Both dispersions present an aging effect, with decreasing activation energy for the Debye dispersion and with increasing activation energy for the second one. It was shown that the sum of these activation energies retains a constant value of (1.05 + or - 0.02) eV. (Humphreys-ISWS)

GLACIAL EROSION BY THE LAURENTIDE ICE SHEET,
Aberdeen Univ. (Scotland). Dept. of Geography.
D. E. Sugden.
Journal of Glaciology, Vol 20, No 83, p 367-391, 1978. 14 fig, 47 ref.

Descriptors: *Glaciology, *Erosion, *Canada, *Geomorphology, Glaciers, Ice, Geologic investigations, Glaciation, Geology, Topography, Freezing, Pleistocene epoch, Analysis, Methodology, Analytical techniques, Scour, Abrasion, Movement, Laurentide ice sheet, Ice flow.

The aim of the paper was to analyze landscapes of glacial erosion associated with the Laurentide ice sheet at its maximum and to relate them to the three main variables affecting glacial erosion, namely former basal thermal regime of the ice sheet, the topography of the bed, and the geology of the bed. The key to the analysis is the comparison of the distribution of landscape types with the simulated pattern of the basal thermal regime of the former ice sheet. Using lake-basin density as an indication of the intensity of glacial erosion, a zone of maximum erosion was identified. This zone forms a ring between the center of the former ice sheet and its periphery. This ring coincides with a zone where melt water from the ice-sheet center is calculated to have frozen on to the bottom of the ice sheet. This regelation incorporated basal debris into the ice, forming a basal layer 20-50 m thick, and afforded an efficient means of debris evacuation. A conceptual model was developed and was based upon the following postulates: (1) Landscapes of glacial erosion are related primarily to the basal thermal regime of the

ice sheet. (2) Landscapes of glacial erosion are equilibrium forms related to maximum glacial conditions. This implies that at some stage in the Pleistocene the Laurentide ice sheet was in a stable maximum condition for a long period of time. (3) Mechanisms allowing evacuation of debris rather than those of abrasion or fracture may be the most important in influencing the amount of erosion achieved by an ice sheet. (4) Cold-based ice may accomplish erosion if it contains debris. (Humphreys-ISWS)

FORMER ICE SHELVES IN THE CANADIAN HIGH ARCTIC,
Alberta Univ., Edmonton. Dept. of Geography.
J. England, R. S. Bradley, and G. H. Miller.
Journal of Glaciology, Vol 20, No 83, p 393-404, 1978. 5 fig, 1 tab, 42 ref. NSF OCD-00975.

Descriptors: *Ice, *Canada, *Geomorphology, *Dating, *Arctic, Glacial drift, Radioactive dating, Carbon radioisotopes, Stratigraphy, Amino acids, Age, On-site investigations, Quaternary period, *Ellesmere Island, Ice shelf.

Moraines deposited by the outermost ice advance across Judge Daly Promontory, northeastern Ellesmere Island, reflect thin, topographically controlled ice lobes extending to sea level. The termini of two ice lobes were investigated, and both produced ice shelves where they flowed into isostatically depressed embayments along western Kennedy Channel. Morphological evidence for these ice shelves occurs at the entrance to these valleys where steeply descending lateral moraines become abruptly horizontal for 2 km. In addition, both the horizontal moraines and associated proglacial terraces are fossilferous down-valley from the apparent grounding line. Based on the differences in elevation between the horizontal moraines and the valley bottoms, the two ice shelves had estimated thicknesses of 110 and 150 m. A proglacial outwash terrace at 175 m a.s.l. is considered to represent the approximate relative sea level during the formation and break-up of the ice shelves. This relative sea level is consistent with the water depths required to float the calculated ice thicknesses in both valleys. Associated with these ice margins are finite 14C dates of 28000-30000 B.P. and amino-acid age estimates of greater than 35000 B.P. The importance and likelihood of additional past ice shelves in the Canadian High Arctic was discussed. (Humphreys-ISWS)

RECORDING WIRE STRAINMETERS ON THE BARNES ICE CAP, BAFFIN ISLAND, CANADA,
Cambridge Univ. (England). Dept. of Geodesy and Geophysics.
K. Evans, D. J. Goodman, and G. Holdsworth.
Journal of Glaciology, Vol 20, No 83, p 409-423, 1978. 11 fig, 4 tab, 12 ref, 2 append.

Descriptors: *Ice, *Strain measurement, *Instrumentation, *On-site tests, *Canada, On-site investigations, Strain, On-site data collections, Strain gages, Rates, Analysis, Testing procedures, *Baffin Island(Canada), *Barnes Ice Cap, Ice caps.

The report described an experiment to evaluate the use of geophysical (Cambridge-type) wire strainmeters for the rapid acquisition of strain-rate data and to compare strains on a large ice mass over gauge distances of 5 m, 50 m, and 1 km. Three continuously recording wire strainmeters were installed at the center of two separate arrays of strain poles 10.6 km and 19.5 km from the ice divide on the Barnes Ice Cap. Data were collected between 24 April and 15 May 1976. The 1 km strain arrays had been measured previously in 1974 and 1975. The results showed good agreement between the strainmeter data and the larger strain arrays at the 10.6 km site, but results differed at the 19.5 km site. When the daily means were calculated for the strainmeters at the 19.5 km site, the strain-rates showed a possible periodic variation with an apparent period of about 11 d. Since there appears to be no direct correlation between the strainmeters signal and either temperature or pressure, the result was assumed to represent real varying strain within the ice. (Humphreys-ISWS)
W79-00696

AN INVESTIGATION INTO THE USE OF STRAIN ROSETTES FOR THE MEASUREMENT OF PROPAGATING CYCLIC STRAINS,
Scott Polar Research Inst., Cambridge (England).
V. A. Squire.
Journal of Glaciology, Vol 20, No 83, p 425-431, 1978. 6 fig, 11 ref.

Descriptors: *Strain measurement, *Sea ice, *Instrumentation, *On-site tests, Strain, Strain gages, Ice-water interfaces, Waves(Water), Analytical techniques, Analysis, Measurement, Gravity waves, Frequency, *Newfoundland, *Notre Dame Bay(Newfoundland), Strainmeter rosettes, Principal strain, Principal axes.

An investigation into the feasibility of using a strain rosette to measure the principal strains and to locate the principal axes for propagating strain wave was carried out for the particular application of a flexural-gravity wave in sea ice. It was found that the separation of the instruments in the rosette is extremely critical, and, for a physically realizable rosette, errors are unavoidable if strain is to be monitored continuously. An alternative approach was proposed employing frequency-domain analysis and in particular a running-power spectral density. The method was demonstrated with data obtained from strainmeters on fast ice in Notre Dame Bay, Newfoundland. Two distinct wave components were found to be present of period 6 s and 13 s, and it was shown with 99.9% confidence that they are propagating in different directions. (Humphreys-ISWS)
W79-00697

A MECHANICAL TEST PROCEDURE FOR AVALANCHE SNOW,
Beck (R. W.) and Associates, Denver, CO.
S. L. McCabe, and F. W. Smith.
Journal of Glaciology, Vol 20, No 83, p 433-438, 1978. 4 fig, 1 tab, 12 ref.

Descriptors: *Snow, *Strain measurement, *Instrumentation, *On-site investigations, On-site tests, Avalanches, Stress, Strain, Mechanical properties, Strength, Measurement, Methodology, Test procedures.

The design, construction, and testing of a portable constant strain-rate testing machine for determining the mechanical behavior of avalanche snow were described. The machine is intended for use in determining the stress-strain-time behavior of low-density natural snows in the field. A technique for making direct measurements of strain in the snow sample was described, and stress-stran curves were presented for strain-rates ranging from 0.000005 to 0.00005/s. The densities of the snow samples tested ranged from 186 to 335 kg/cu m. Ultimate-strength data and relaxation curves also were presented. In order to provide stress-strain-strain-rate data which will be useful for stress and deformation finite-element modelling of avalanche snow-packs, it will be necessary to conduct tests at lower strain-rates and for longer time periods. It also may be necessary to conduct tests with larger samples to avoid problems caused by the presence of flaws in the snow. (Humphreys-ISWS)

HEAT AND MASS TRANSPORT PROCESSES IN SUBSEA PERMAFROST I. AN ANALYSIS OF MOLECULAR DIFFUSION AND ITS CONSEQUENCES,
Alaska Univ., Fairbanks. Geophysical Inst.
W. D. Harrison, and T. E. Osterkamp.
Journal of Geophysical Research, Vol. 83, No. C9, p 4707-4712, September 29, 1978. 2 fig, 25 ref. NOAA 04-5-158-35, 04-6-158-44039, 04-7-158-44006 NSF DPP76-18399.

Descriptors: *Permafrost, *Alaska, *Heat transfer, *Mass transfer, *Model studies, *Arctic, Mathematical models, Oceans, Cold regions, Diffusion, Thawing, Temperature, Salinity, Salts, Bays, Shores, *Beaufort Sea(Alaska), *Prudehoe Bay(Alaska), *Subsea permafrost.

Some heat and mass transport processes in subsea permafrost were discussed. An exact solution was given for a coupled model in which both heat and salt are transported solely by diffusion. The model describes the development of a thawed layer beneath the seabed after an ocean transgression over deeply frozen ground and is a generalization of the well-known Stefan problem. A stability calculation indicated that such a diffusive regime should be unstable to convection of the interstitial water in the thawed layer after a critical thickness has been reached. The theory was compared with observations from two sites in the Beaufort Sea, Alaska. In western Elson Lagoon, near Barrow, the diffusive regime may be stable, but at Prudhoe Bay it is not, and interstitial water motion is important. At Prudhoe Bay the salt and heat transport regimes are convective and diffusive, respectively. (Sims-ISWS)

PROBABILITY ESTIMATE OF SNOW-COVER DEPTH DISTRIBUTION,
I. D. Kopanev.
Soviet Hydrology: Selected Papers, Vol. 15, No. 4, p 281-287, 1976. 2 fig, 8 tab, 14 ref. Translated from Trudy Glavnoi Geofizicheskoi Observatorii, No. 349, p 3-15, 1976.

Descriptors: *Snow cover, *Depth, *Probability, *Distribution patterns, Snow, Snow surveys, Data processing, Analytical techniques, Forests, Snowfall, Statistica, Variability, Water resources, *USSR.

Snow cover distribution in a particular region is determined by many factors, which cannot always be taken into account quantitatively. Statistical, along with physical methods, have been used extensively in recent years to solve many scientific and practical problems in hydrometeorology. An extensive literature is devoted to snow cover distribution in the USSR, mainly to its average and extreme characteristics. Not only data on average snow cover depth, but also on its probability in a particular area are required to satisfy the demands of many branches of the national economy. Data on snow cover distribution in the USSR are given in the 35 volumes of the Climatic Handbook of the USSR for individual points. It is difficult to use this extensive and disconnected information on snow cover for practical and scientific purposes. Snow cover dpeth distributions were analyzed over the territory of the Northwestern Hydrometeorological Service Aministration by mathematical statistics. To this end, snow survey data were used for the period of 1935-1964 at 142 stations. Of these, 93 stations performed snow surveys in the field and 49 stations in the forest and in forest clearings. This analysis of the data showed that the snow cover distribution in the territory of the Northwestern Hydrometeorological Service Administration is normal. (Sims-ISWS)

Descriptors: Absorption, *Mixing, Oxygen, *Water circulation, Water quality, Air movement, Circulation, *Aeration, Dissolved oxygen, Measurement, Mass transfer, Model studies, Jets, Velocity measurement, Manifolds, *Vertical plumes, *Oxygen transfer, *Air bubble plumes, *Mixing device.

Experimental studies of the patterns of circulation and flow induced by aeration from point and line sources submerged in water have been carried out in the laboratory. The influence of the system variables such as aerator design, water depth and air supply rate, on the induced flow were studied. Efforts were made to extend and clarify the work of previous similar studies for aeration from linear systems. The experimental results are generally in good agreement with those obtained by previous investigators. The ratio of induced water discharge relative to air discharge as a measure of aeration efficiency has been examined and found to increase with manifold submergence depth and decrease with increasing air discharge rate within certain limits. A comparison of the induced flow patterns between the plane water jet and linear air bubble plume system has been made. In addition, an efficiency criterion for comparing these two systems was proposed for a given set of conditions. Measurements are presented of the transfer rate of dissolved oxygen in water from rising air bubbles released from a linear manifold. A simple mass transfer model successfully correlates the data with only one lumped constant which is a function primarily of aeration rate and manifold characteristics.

2F. Groundwater

A GROUNDWATER RECHARGE MODEL AND APPLICATION TO A SMALL WATERSHED,
Nebraska Univ., Lincoln.
D. M. Manbeck, and M. Arbab.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 118, Price codes: A04 in paper copy, A01 in microfiche. Nebraska Water Resources Center Project Completion Report, September 1977. 60 p, 15 fig, 3 tab, 26 ref, 1 append. OWRT A-042-NEB(1).

Descriptors: *Mathematical models, *Watersheds(Basins), *Groundwater movement, *Groundwater recharge, *Nebraska, *Runoff, Soil moisture, Evapotranspiration, Soil water movement, Percolation, Soil water, Equations, Water table, Precipitation(Atmospheric), Irrigation, Computer models, Simulation analysis, Test wells, Groundwater resources, Forecasting.

A mathematical simulation model for tracing the movement of precipitation from soil surface to the groundwater table was developed. Required input for the model includes: mean monthly air temperature, monthly precipitation, and soil moisture characteristics. It applies a series of deterministic equations to relate precipitation to infiltration, compute surface runoff, evapotranspiration, deep percolation, and the recharge to the groundwater zone. The model can be used to determine the amount of water from precipitation and irrigation which moves vertically downward from one soil level to the next on a monthly basis for various initial soil conditions. The model was applied to simulate conditions of a small watershed in southeastern Nebraska. The simulation predictions of runoff, evapotranspiration, moisture profile, and groundwater recharge. However, because of inavailability of observed data, only computed runoff was compared to the observed and found to match closely. Groundwater level observations in the area were used to check the computed recharge to the groundwater zone but they were found to be more than the model. This is due to groundwater flow, which moves from high water table areas towards the natural streams in the northern part of the watershed area where the observation well is located. (Majtenyi-IPA)

DOLOMITIZATION IN THE FLORIDAN AQUIFER,
Florida Univ., Gainesville. Dept. of Geology.
A. F. Randazzo, and E. W. Hickey.
In: Proceedings, Second International Symposium on Water-Rock Interaction, Strasbourg, August 17-25, 1977. p I82-I91, 1 fig, 2 tab, 18 ref. Centre National de la Recherche Scientifique, Strasbourg, France. OWRT B-032-FLA(2), 14-34-0001-7148.

Descriptors: *Groundwater movement, Porosity, Permeability, Groundwater resources, *Limestones, Petrography, Water management(Applied), *Aquifers, Facies, *Diagenesis, *Florida, *Dolomitization.

Lithofacies, representing multiple transgressive-regressive cycles of sedimentation, characterize 20 cores penetrating the Floridan Aquifer. Original texture is preserved more frequently in rocks deposited in a supratidal environment and replaced by stoichiometric dolomite. Non-stoichiometric dolomite commonly is associated with obscured or obliterated limestone fabrics. Strontium in both dolomite groups generally is less than 200 ppm and indicates crystallization in a solution less saline than seawater. Dolomitization continued with time as rocks of supratidal and other environments of the area were subjected to repeated lateral migrations of a salt water - fresh water interface and phreatic groundwater conditions. OCCURRENCE, QUALITY, AND AVAILABILITY OF GROUND WATER IN JONES COUNTY, TEXAS,
Texas Dept. of Water Resources, Austin.
R. D. Price.
Report 215, April 1978. 246 p, 40 fig, 12 tab, 60 ref.

Descriptors: *Texas, *Groundwater, *Groundwater availability, *Water quality, *Data collections, Aquifers, Census, Water wells, Well data, Groundwater resources, Hydraulic properties, Chemical analysis, Drillers logs, Springs, Geology, Irrigation wells, Water level fluctuations, Aquifer characteristics, Dissolved solids, Climatology, Groundwater recharge, Geologic formations, *Jones County(Texas), Chemical quality, Seymour formation, Choza formation, Vale formation, San Angelo formation.

The scope of this project included the collection, compilation, and analysis of data pertaining to the distribution and quality of groundwater in the county. Special emphasis was placed on determin-

ing the sources of water suitable for municipal, industrial, irrigation, domestic, and livestock use. Areas and possible sources of present or potential groundwater contamination were delineated. Jones County, with an areal extent of approximately 950 sq mi, is located in north-central Texas. The most reliable source of usable-quality groundwater in Jones County is the Seymour Formation which yields fresh to moderately saline waters in small to moderate quantities. The chemical analyses of water samples indicated that only a few scattered areas of Jones County produce groundwaters that meet the chemical quality standards recommended for public supplies by the U.S. Public Health Services. The water commonly have a high content of sulfate, nitrate, chloride, and dissolved solids. To further evaluate the future effects of heavy irrigation or industrial pumpage from the various aquifers, a network of 19 observation wells has been established in which water levels are planned to be measured and recorded annually. Soil and Crop Science Society of Florida Proceedings, Vol. 36, p 101-107, November 16-18, 1976. 13 fig, 14 ref. OWRT A-034-FLA(1), 14-34-0001-8010.

Descriptors: *Irrigation efficiency, *Deep sands, *Controlled root-zone wetting, Evapotranspiration, Drainage, Subsurface asphalt barrier, Water storage, Deep water seepage, Two-layered soils, *Soil water movement, Infiltration, *Redistribution(Plants), Vegetation.

A numerical solution of the equation governing soil water movement and uptake by plants during infiltration and redistribution was used to investigate the influence of the amount of irrigation and soil nonuniformity on deep seepage loss and soil water storage in the root zone. For a uniform Lakeland sandy soil the deep seepage loss increased as the amount of water applied in an irrigation event increased. However, the presence of a low permeability lower layer in a two-layered soil profile was beneficial in increasing soil water storage and in minimizing deep seepage loss. Such a decrease in deep seepage loss was more pronounced when large amounts of irrigation were applied and the hydraulic conductivity of the lower layer was extremely small. For small irrigations, the influence of a low permeability lower layer on deep seepage loss was essentially negligible. (Morgan-Florida)

FIELD DETERMINATION OF VERTICAL PERMEABILITY TO AIR IN THE UNSATURATED ZONE,
Geological Survey, Lubbock, TX. Water Resources Div.
E. P. Weeks.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price $1.90. Professional Paper 1051, 1978. 41 p, 12 fig, 6 tab, 50 ref.

Descriptors: *Permeability, *Hydraulic conductivity, *Zone of aeration, *Atmospheric pressure, *Analog models, Infiltration, Soil water movement, Absorption, On-site investigations, Evaluation, *Unsaturated zone.

The vertical permeability to air of layered materials in the unsaturated zone may be determined from air pressure data obtained at depth during a period when air pressure is changing at land surface. Such data may be obtained by monitoring barometric pressure with a microbarograph or surveying altimeter and simultaneously measuring down-hole pneumatic head differences in specially constructed piezometers. These data, coupled with air-filled porosity data from other sources, may be compared with the results of electric-analog or numerical solution of the one-dimensional diffusion equation to make a trial-and-error determination of the air permeability for each layer. The permeabilities to air may in turn be converted to equivalent hydraulic conductivity values if the materials are well drained, are permeable enough that the Klinkenberg effect is small, and are structurally unaffected by wetting. The method offers potential advantages over present methods to evaluate sites for artificial recharge by spreading; to evaluate ground-water pollution hazards from feedlots, sanitary landfills, and land irrigated with sewage effluent; and to evaluate sites for temporary storage of gas in the unsaturated zone. MAGNETIC RELAXATION STUDY OF WATER MOBILITY IN CLAY MINERALS,
North Dakota Univ., Grand Fork.
J. J. Schneider, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 316, Price codes: A03 in paper copy, A01 in microfiche. M.S. Thesis, August 1977, 36 p, 15 fig, 2 tab, 15 ref. OWRT A-051-NDAK(1), 14-34-0001-7072.

Descriptors: *Soil moisture, Absorbed water, Soil physical properties, Calcium, Montmorillonite, Kaolin, Pulse nuclear, *Magnetic resonance, *Clays, Sodium.

Longitudinal and transverse relaxation rates of the protons of water molecules adsorbed by Na- and Ca-montmorillonite and untreated kaolin were measured by use of the pulse NMR technique. The Na-montmorillonite and kaolin samples contained 10% and 60% water by weight and the Ca-montmorillonite samples contained 20% and 60% water. The montmorillonite samples were studied between +20C and -136C and the kaolin samples between +20C and -30C. The longitudinal relaxation of the kaolin samples was exponential above 0C and distinctly non-exponential below 0C. The transverse relaxation of the kaolin samples was approximately exponential both above and below 0C but decreased considerably when the samples were cooled through 0C. Such behavior suggests a partial freezing of the absorbed water at 0C. For the montmorillonite samples no discontinuous variation in the relaxation was observed as the temperature was lowered. The longitudinal relaxation was approximately exponential at the highest temperatures and became increasingly nonexponential as the temperature was lowered. Below -30C the relaxation was resolved into two exponential components, although it could probably be described by using more than two exponential terms. The short, long and average longitudinal relaxation times for all montmorillonite samples went through minima between -50C and -60C. The values of the relaxation times at the minima are smaller than would be expected due to nuclear dipole-dipole interactions alone and are explained in terms of the effect of paramagnetic impurities. Correlation times and activation energies for the protonic motion and relaxation times of the paramagnetic centers have been obtained from the proton longitudinal relaxation. The transverse relaxation of the montmorillonite samples was approximately exponential at all temperatures. T2 appeared to approach a temperature independent maximum value at high temperatures and a rigid lattice value at low temperatures. After corrections for the high temperature effect, activation energies were calculated from linear portions of the T2 curves.

Error estimates are derived for a numerical scheme for finding an approximate solution to nonlinear parabolic equations in the plane with mixed nonlinear boundary conditions. The scheme involves the Galerkin method coupled with successive substitutions and the Crank-Nicolson approximation. Problems of this type arise when considering unsteady, unsaturated flows in porous media. (Snyder-Calif, Davis)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 310, Price codes: A02 in paper copy, A01 in microfiche. Report No. IWR-82, June 1977. 10 p. OWRT C-6169(No. 5217)(1), 14-31-0001-5217.

Descriptors: *Model studies, *Ecosystems, *Lakes, *Alaska, *Water resources development, Water resources management, Limnology, Iced lakes, Ice cover, Ice breakup, Hydroelectric power, Fish hatcheries, Evaluation, Computer models, Simulation, Aquatic environment, Aquatic life, Climatology, Sampling.

Adaptation of a pre-existing model ecosystem was studied for application to management problems of Northern lakes and suggestions were made for appropriate strategy for simulating aquatic ecosystems in cold regions. Harding Lake was used as a case study because it is easily accessible, located 80 km southeast of Fairabanks. Also, it is a rather large, deep subarctic lake and provide good field data for the modeling project. Areas of interest included general constituent levels, certain aspects of lake geometry, and climatic conditions. Spring breakup is a very important season in artic limnology, yet is difficult to simulate because of the unstable nature of the water column during that period. Other weaknesses of the simulation involve other ice-related phenomena, the biological portion of the model, and the difficulty in detecting errors because of shielding by internal interaction. However, many of these problems were solved and the model was adapted for use on northern lakes. Potential applications for the model were identified, including reservoirs of a large hydroelectric project in southcentral Alaska, a salmon hatchery supply lake, and other lake and reservoir management schemes throughout the state.

Descriptors: *Destratification, *Mixing, *Lakes, *Fish, *Fish conservation, *Habitats, *Habitat improvement, Oklahoma, Nutrients, Channel catfish, Freshwater fish, Gizzard shad, White crappie, White bass, Ecology, Water quality, Surveys, Evaluation, Aquatic environment, Reservoirs.

The effect of mechanical mixing carried out on Lake Arbuckle, Oklahoma, in 1977, was investigated by measuring seasonal and annual growth rates of fish. In 1976 and in 1977 after mixing, fish were taken using gill nets, and scales and spines were examined to reveal the effect on growth rates. The mixing attempt to destratify the reservoir and improve fish environment did increase the habitat available to the fish. Seasonal growth rates of gizzard shad and channel catfish, which are bottom feeders, were greater during the destratified period when more of the bottom area was available for feeding. Pelagic feeders like white crappie and white bass were less adversely affected by the loss of bottom habitat. Mechanical mixing increased the amount of available fish habitat in late summer which probably benefited growth, but the best growth occurred when available fish habitat was expanded in early summer. To maximize growth, mixing should begin in early May with the objective of preventing vertical stratification.

STUDIES ON A SALINE LAKE ECOSYSTEM,
Australian National Univ., Canberra. Dept. of Environmental Biology.
K. F. Walker.
Aust J Mar Freshwater Res. 24(1), p 21-71, 1973.

Descriptors: Anabaena-spiroides, Bacteria, Brachionus-plicatilis, Chroococcus, Ciliates, Climates, *Ecosystem, Energy, Evaporation flux, Gull, Gymnodinium-aeruginosum, Hexarthra-jenkinae, Insects, Lakes, Minerals, Necterosoma-penicillatum, Primary productivity, Rainfall, *Saline lakes, *Australia(Victoria), Tanytarsus-barbitarsis, Temperature, Trophic levels.

A descriptive study was made of a saline crater lake over 3 yr (1968-1970). Lake Werowrap is associated with the Red Rock scoria cone, western Victoria, Australia. Meteorological data were used to compute the hydrological and analytical energy budgets for 1969 and 1970. The main determinant of variations in lake salinity and volume was the evaporation/rainfall balance, although groundwater seepage also was implicated. The average rate of water renewal was 0.725 times per year. The annual heat budgets of the lake (mean, 1712 g cal/cm2) and the lake sediments (mean, 1218 g cal/cm2) were very small fractions of the total energy fluxes within the system. Energy fluxes were governed mainly by incident radiation, evaporation, back-radiation and sensible heat transfer. Chemically, the lake water is highly alkaline (pH 9.8), predominantly of sodium 'chlorocarbonate' composition, and showed stable ionic proportions despite salinity fluctuations. Inorganic N and P concentrations were high and influenced seasonally by a gull population breeding on a msall islet in the lake. Optical measurements indicated rapid light attenuation due to dissolved organic material and dense plankton populations. Considerable bacterial activity was indicated by high rates of 'dark' carbon-14 assimilation. Attention was given to the population dynamics of the rotifer Brachionus plicatilis, the dominant zooplankter, which attained peak densities in summer and autumn. Other zooplankton species included the rotifer Hexarthra jenkinae, 2 ciliates and larvae of aquatic and terrestrial insects, notably the dytiscid Necterosoma penicillatum, which occurred around the lake margins. The benthis community consisted solely of the chrionomid Tanytarsus barbitarsis.--Copyright 1974, Biological Abstracts, Inc.

COLONIAL BIRDS NESTING ON MAN-MADE AND NATURAL SITES IN THE U.S. GREAT LAKES,
Northwestern Michigan Coll., Traverse City.
W. C. Scharf.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi. Technical Report D-78-10 and FWS/OBS-78/15, May 1978. 328 p, 32 tab, 25 fig, 34 ref, 5 append.

Descriptors: *Birds, *Great Lakes, Habitats, *Nesting, *Vegetation, Islands, *Colonial birds, Dredged material.

Habitats and nesting populations of colonial nesting birds of the U.S. Great Lakes were determined by aerial census, ground nest observations, and vegetation analysis during 1976 and 1977. Thirteen species at 267 colonies were found. An atlas of nesting sites and populations of colonies is provided. Intensive vegetation and habitat studies were performed on 24 sites: 8 natural islands and 16 dredged material locations. A greater percentage of cover by herbaceous vegetation was favored by ring-billed gulls and herring gulls, but common and Caspian terns perferred less vegetative cover. Both ciconiiform and larid colonial nesters killed or badly stressed vegetation supporting, surrounding, and below their nests. Soil analysis showed high levels of macronutrients in most colonies except to a few adapted plant species frequently found in heavily fertilized ring-billed gull colonies. Colony size and previous experience of breeders seemed more important than latitude in determining date of peak hatching and chronological sequence of nesting in ring-billed gulls. The water table affected nesting success by changing vegetation from hydric to xeric seres. (WES)

Descriptors: Reservoirs, *Diurnal, *Temperature distribution, *Thermocline, *Stratification, *Impoundments, *Solar energy, Model studies.

The diurnal temperature distribution in a deep water impoundment which is exposed to heating and cooling loads by convection, evaporation and radiation is examined. The diurnal behavior of the solar load, directional and spectral, is used with the selective attenuation and reflection characteristics of the water to account for the internal solar energy absorption rate. Simple atmospheric and water attenuation models were used to examine and simulate the diurnal behavior. The results demonstrate the stratification developments of the reservoir and indicate that in some cases deep layer responds continuously to the diurnal fluctuations of surface energy loads.

The rank correlation of Kendall, correlations of Bravais-Pearson and the definition of characteristic species by the method of the 'ecart reduit' permit the classification of the permanent lakes studied in 3 great biological zones. Temporary ponds, where the variations in salinity are continuous and important, compose particular biotopes, however, their algal flora has affinities with that of polycarbonated lakes. OXYGEN PRODUCTIVITY OF PERIPHYTON ON HIGHER AQUATIC PLANTS (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
V. V. Yurchenko.
Gidrobiol Zh 13(4), p 49-52, 1977.

Descriptors: Algae, Epiphytes, Minerals, Aquatic plants, *Periphyton, *Oxygen productivity(Plants), Oxygen requirements.

When estimating the effect of higher water plants on the O2 regime of a water body they should be considered as a complex with periphyton which depending on conditions, may increase or decrease O2 in the water. At low transparency, when periphyton contains a lot of mineral particles and vacant cells of algae, it may absorb isolated by water plant. With high transparency and abundant epiphyte development, O2 isolated by algae is added to O2 produced by higher water plants.--Copyright 1978, Biological Abstracts, Inc.

UNDERGROUND BIOMASS DYNAMICS AND SUBSTRATE SELECTIVE PROPERTIES OF ATLANTIC COASTAL SALT MARSH PLANTS,
Georgia Univ., Sapelo Island. Marine Inst.
J. L. Gallagher, F. G. Plumley, and P. L. Wolf.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A055 761, Price codes: A08 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-77-28, December 1977. 167 p, 39 tab, 15 fig, 25 ref, 3 append.

Descriptors: *Biomass, *Marsh plants, *Salt marshes, *Atlantic coastal plains, *Dredged material, *Substrates, Coastal plains, Plant populations.

Provides information applicable to marsh development on dredged material, particularly methodologies that can be used for determining which marsh plants will be likely to do well on various kinds of dredged material and when a marsh, which has been established on dredged material, approaches natural conditions. Focuses on three major efforts: an investigation of underground biomass dynamics, characterization of soils supporting the salt marsh plants, and experimentation on the substrate selective properties of several of the marsh plants studied. The methods and results for the specific aspects of these three efforts are delineated in five self-contained sections of the report: underground biomass profiles and dynamics in Atlantic coastal marshes, comparison of some tidal marsh soils along the Atlantic Coast, response of salt marsh plant stands to a pulse of ammonium nitrate, salt marsh plant growth on three types of dredged material, and a bioassay approach to studying marsh plant root growth in natural soil and dredged material. Findings indicate that in developing salt marsh on dredged material, five substrate problems should be considered: stability, pH characteristics; salinity characteristics; soil characteristics; and nutrients, of which nitrogen appears to be the key element. THE CONCEPT OF FLOODING OF BOTANICAL OBJECTS AND CLASSIFICATION OF FLOODING, (IN UKRANIAN),
Akademiya Nauk URSR, Kiev. Central Republican Botanical Garden.
I. O. Davydenko.
Ukr Bot Zh 33(1), p 89-90, 1976.

Descriptors: *Plant physiology, *Flooding, Underflooding, *Classification(Botanical), Groundwater level, Soil-water-plant relationships.

Underflooding is defined as flooding caused by the rise in groundwater level due to the raising of capillary fringe or partial drowning of a plant in the substrate. The effects of the underflooding on the plant are classified as stimulating, indifferent, depressant or lethal. The causes of underflooding are listed as anthropogenic, natural or combined.--Copyright 1978, Biological Abstracts, Inc.
W79-00612

PRELIMINARY GUIDE TO WETLANDS OF PUERTO RICO, MAJOR ASSOCIATIONS AND COMMUNITIES IDENTIFIED.
Army Engineer Waterways Experiment Station, Vicksburg, MS.
Technical Report Y-78-3, April 1978. 77 p, 3 fig, 47 ref, 3 append.

Descriptors: *Wetlands, *Plant populations, *Puerto Rico.

One of a series of eight preliminary guides to the dominant plant associations and communities found in the major wetlands of the United States. The primary purpose is to aid regulatory functions personnel in recognizing and delineating wetlands subject to permit regulation under Section 404 of Public Law 92-500 (Federal Water Pollution Control Act Amendments of 1972). Consists of three parts. An introduction covers the purpose and use of the guidebook as well as general information about Section 404 wetlands. The second part, 'Wetlands of Puerto Rico,' consists of three major sections: Regional Environment, Regional Botanical References, and Wetland Types. The section on regional environment provides a broad context for the more detailed descriptions of the dominant plant associations and communities found in the major wetlands of the region. The nomenclature standard used for the guide is presented in the section on regional botanical references. Description of wetland vegetation is based upon data from the literature and scientists familiar with the region. This section provides a description sufficiently detailed for field use but does not report minor variations of each wetland. The third part contains references to pertinent publications and is specific to the region.

HABITAT STRUCTURE AND STREAM FISH COMMUNITIES,
Purdue Univ., Lafayette, IN. Dept. of Biological Sciences.
O. T. Gorman, and J. R. Karr.
Ecology, Vol. 59, No. 3, p 507-515, 1978. 4 fig, 3 tab, 40 ref.

Descriptors: *Habitats, *Aquatic habitats, *Stream beds, *Streamflow, *Niches, Seasonal, Fish populations, Biological communities, Ecology, Adaptation, Streams, Currents(Water), Channels, Channel improvement, *Indiana, Evolution, *Panama, *Species diversity.

Stream habitat complexity is correlated with fish species diversity in selected Indiana and Panama streams. Habitat diversity was measured along 3 dimensions judged important to a wide range of fish groups and applicable to many stream conditions: stream depth, bottom type, and current. Increasing community and habitat diversity followed stream-order gradients. Natural streams supported fish communities of high species diversity which were seasonally more stable than the lower-diversity communities of modified streams. After disturbances such as channelization, seasonal peaks in species diversity attain levels typical of undisturbed streams. Because seasonal changes in stream quality are high, the stability of the fish community is lower in modified than in natural streams. The general correlation between habitat characteristics and presence and absence of fish species suggests that most fishes of small streams are habitat specialists. (EIS-Deal)

Descriptors: Basins, *Benthic communities, Biomass, *Chemical composition, Flow, Invertebrates, Nutrients, Rivers, Soils, Species, Streams, USSR, *Water pollution, *Bottom sediments, *Desna watershed(USSR).

The soils of watershed area and bottom sediments of small rivers, especially at the periods of minimal streamflow, have an essential effect on the formation of the water's chemical composition, thus determining to a considerable extent the pH values, content of HCO3-, Ca2, Mg2+, NH42- and phosphate ions. Biomass and species composition of the invertebrate benthic organisms depend on the content in the soils of Ca, organic matter and its nutrients.--Copyright 1977, Biological Abstracts, Inc.

FIELD CHAMBER MEASUREMENTS OF CO2 FLUX FROM SOIL SURFACE,
Kansas State Univ., Manhattan. Evapotranspiration Lab.
E. T. Kanemasu, W. L. Powers, and J. W. Sij.
Vol. 118, No. 4, p 233-237, 1974. 2 fig, 19 ref.
OWRT A-044-KAN(5), 14-31-0001-3516.

Descriptors: Diffusion, *Carbon dioxide, Chemical analysis, *Soil respiration, Mass flow.

Rates of carbon dioxide exchange were determined using an infrared gas analyzer in an open-chamber system in a field. During 1971 a fan was used to draw air through the chamber; the measured CO2 flux was approximately 40 percent greater than the highest rate reported in the literature. In 1972 two chambers were used: one under slight suction and the other under a slight pressure (compared with atmospheric pressure). The CO2 flux from the soil surface inside the 'pressure' chamber was nearly an order of magnitude lower than inside the 'suction' chamber. Dispersion equations were used to separate mass flow and diffusion components of the total flux. Simplified analysis showed that mass flow could account for the large CO2 flux with slight negative pressures inside the chamber.

NMR INVESTIGATION OF MOBILITY OF WATER SORBED BY CLAY MINERALS,
North Dakota Univ., Grand Forks.
L. J. Laughlin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 469, Price codes: A03 in paper copy, A01 in microfiche.
MS Thesis, May 1977. 38 p, 10 fig, 17 ref, append.
OWRT A-051-NDAK(2), 14-34-0001-7072.

Descriptors: Soil moisture, Adsorbed water soil, Physical properties, *Nuclear magnetic resonance, *Clays, Mineralogy, Calcium, Sodium, Soil water movement, *Montomorillonite, Soil analysis.

The mobility of water sorbed in different clay minerals was studied using NMR relaxation times and using diffusion coefficients as measured by pulsed field gradient and radiotracer techniques. In general, T1 and T2 measurements showed an increase in mobility as a function of water content. However, T2 measurements for Ca-Montmorillonite leveled off at 60% water content and slightly decreased beyond 60% moisture level. Diffusion measurements using the pulse gradient method were not possible for the Montmorillonites because of the small values for the relaxation times. But, for Kaolin diffusion measurements were made, using the pulsed gradient technique, at 22 degrees C for all moisture levels and from 0 degrees C to 50 degrees C for 60% water content. The plot of ln D versus 1/T yields a straight line with an activation energy of 1.08 kcal/mole calculated from the slope. For the most part, the radiotracer results were smaller than those obtained by the pulsed gradient method. Noting that the time for diffusion with the pulsed gradient method is 7 msec, while the time for the radiotracer method was several hours, this difference is evidence of restricted self-diffusion for Kaolin. Since the pulse gradient system has a dead time of 4 msec, T2 must be about 6 msec or longer in order to measure the diffusion coefficient using this method.
W79-00910

CONTRIBUTION OF NUTRIENTS FROM SEDIMENTS AND INTERSTITIAL WATER TO COLVILLE RIVER SYSTEM, ALASKA,
Louisiana State Univ., Baton Rouge. Dept. of Marine Science.
C. L. Ho, and H. J. Walker.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A030 392, Price codes: A02 in paper copy, A01 in microfiche. Geografiska Annaler, Vol. 58, Ser. A1-2, p 41-54, 1976. 8 fig, 6 tab, 39 ref.

Descriptors: *Rivers, *Sediments, *Alaska, *Nutrients, Floods, Nitrogen, Phosphorus, Clays, Plankton, Colville River System.

In 1971 water samples and bottom sediments were taken prior to breakup, during breakup, and during summer for nutrient study. The organic content in the sediments was higher in the uper river channel than in the oceans, whereas interstitial nitrogen components showed the opposite trend. Through diffusion and animal activity, some of these components may enter the water column beneath the ice during winter. During the flood period in early spring, interstitial components in the basin sediments are also contributed to river water by leaching. Once flooding begins, river water moves under the sea ice as a wedge. It contains more nutrients than does the seawater beneath it. This floodwater, rich in inorganic nitrogen, provides a basic ingredient for phytoplankton production. During summer, depletion of nutrients prevails as a result of phytoplankton uptake and dilution.(Stihler-Mass)

Descriptors: *Abalone, *Spawning(Artificial), Environmental effects, *Chungmu Bay(Korea), *Water temperature, *Light, Bays, Asia, *Korea, *Spawning(Abalone).

Effects of changes in environmental parameters, Water temperature and light period, on the induction of spawning were studied. Subtidal specimens of H.d. hanni were collected irregularly 6 times from April-June 1975 in Chungmu Bay near Jukdo Island, the southern coast of Korea. Specimens (150) were reared in 4 aquarium tanks in the laboratory and in a creel submerged in the sea during April 14-June 23, 1975. All groups kept in the 4 tanks and 1 creel showed very high spawning rates (70-100%), compared to those in the natural environment at sea until just before the natural spawning time (0-50%, average 16.4%). The photoenvironment may stimulate secretion of some internal substances, which permits fertilization to induce spawning. For effective breeding, abalones should be reared under controlled conditions with light below 2000 lx even during daytime for more than 60 days before induced spawning.

Estuarine and Coastal Marine Sciences, Vol 7, No 2, p 99-116, August 1978. 13 fig, 22 ref.

Descriptors: *Model studies, *Water circulation, *Estuaries, *Dissolved solids, *Silica, Streamflow, Discharge(Water), Tidal effects, Saline water-freshwater interfaces, Mixing, Numerical analysis, California, *San Francisco Bay estuary, *Dissolved silica.

A two-dimensional (vertical) steady-state numerical model that simulates water circulation and dissolved-silica distributions is applied to northern San Francisco Bay. The model (1) describes the strong influence of river inflow on estuarine circulation and, in turn, on the biologically modulated silica concentration, and (2) shows how rates of silica uptake relate to silica supply and mixing rates in modifying a conservative behavior. Descriptors: *Marinas, *Shore protection, *Harbors, *Water pollution, *Water quality, *Planning, *Management, Biological oxygen demand, Docks, Land use, Recreation, Shellfish, Flood damage, Erosion, Sedimentation, Urban planning, *Bridgeport(CT), *Waterfront management, *Waterfront development, *Coastal area management, Urban decay, Waterborne commerce.

This report presents the policy recommendations for the development and management of the harbor and waterfront of the city of Bridgeport, CT. Three models are presented for developing this manageent system: (1) the Harbor and Waterfront Agency (HWA) will function as a coordinator of harbor and waterfront activities and consist of representatives from various public and private agencies; (2) the management function of harbor and waterfront development will be assumed by the Office of Development Administration (ODA); the HWA would be under the jurisdiction of the ODA ad would function primarily as an advisory committee; (3) an independent harbor and waterfront authority with its own staff and budget would be established to devote full time to the task. The report identifies the management functions of this system and analyszes the task for each function. First, the adoption of a participatory planning process called the communicative planning process to ensure adequate planning of harbor development is recommended. This process advocates the full and effective use of the communication media to ensure that the plan would be developed and implemeted in consultation with all those affected. Second, the goals and objectives of the plan should be clearly stated and the means for implementing these measures should be delineated. The goals listed are the improvement of economic productivity; the overall improvement of environmetal quality through conservation; and the improvement of the quality of life of low income groups in waterfront areas. Third, the goals are operationalized and translated into specific policy recommendations for various functional areas of waterfront such as shellfish preservation, enlargement of parks and marinas, flood and storm damage control, water quality and others. An inventory of existing resources and uses in investigated in depth to provide a sound basis for the adoption of these plans.

ON TIDAL PROPAGATION IN SHALLOW RIVERS,
British Columbia Univ., Vancouver. Inst. of Oceanography.
P. H. LeBlond.
Journal of Geophysical Research, Vol. 83, No. C9, p 4717-4721, September 20, 1978. 3 fig, 2 tab, 10 ref.

Descriptors: *Tides, *Rivers, *Estuaries, *Model studies, *St. Lawrence River, MAthematical models, Equations, Tides, Tidal waters, Water levels, Time lag, Shallow water, *Tidal propagation, *Fraser River, Shallow rivers, Phase lags.

A reexamination of the momentum balance in shallow rivers, with scaling appropriate to the Saint Lawrence and the Fraser, showed that frictional forces exceed accelerations over most of the tida cycle. Consequently, tidal propagation in shallow rivers was envisaged more properly as a diffusion than as wave propagation phenomenon. The long time lags associated with low waters, unexplainable in terms of a simple wave propagation model, were accounted for easily by an equally simple diffusive model. (Sims-ISWS)

HABITAT DEVELOPMENT FIELD INVESTIGATIONS, RENNIE ISLAND MARSH DEVELOPMENT SITE GRAYS HARBOR, WASHINGTON, SUMMARY REPORT,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
M. K. Vincent.
Technical Report D-78-11, April 1978. 94 p, 6 fig, 21 ref, 4 append.

Descriptors: *Habitats, *Marsh management, *Salt marshes, On-site investigations, *Grays Harbor(Wash), *Rennie Island(Wash), Washington.

A salt marsh development project originally planned for Rennie Island in Grays Harbor, Washington, was terminated after a detailed baseline analysis. These studies indicated that extremely high wave energy conditions at the site would make marsh development infeasible without a substantial protective and retaining structure. Foundation analyses indicated a weak, unstable condition that made a conventional rock or earthen dike unsuitable. An evaluation of various alternative structures revealed that no economically feasible options were available, so the marsh development project was terminated. (WES)

Descriptors: Decapods, *Distribution, Drift, *Estuaries, Genus(Lucifer), Lucifer-chacei, Lucifer-hanseni, Lucifer-penicillifer, Lucifer-Typus, Malagasy-republic, Neritique, Nosy-Be, Plankton, Province, Rainy, Season, Sergestidae, *Spatial distribution, *Temporal distribution, Trophic levels, *Zooplankton.

Four species, L. typus, L. penicillifer, L. chacei and L. hanseni are collected seasonally in neritic waters. They are divided into 2 groups: L. typus, oceanic; and L. penicillifer, L. chacei and L. hansemi, in order of their increasing neritic habitat. L. penicillifer and L. chacei are found on the continental shelf during the rainy season; L. hanseni, inner neritic, is collected in the outer neritic area when the estuary waters drift. The station nearest the shore is the richest in neritic species. These are driven back on the coast in the dry season, when L. typus is found on the continental shelf. L. penicillifer shows a more definite seasonal cycle than L. chacei. Breeding is continuous at the inshore station. Trophic factors restrict abundance in the rainy season. THE MESA PUGET SOUND PROJECT, SEATTLE, WASHINGTON. FY76-ANNUAL REPORT.
National Oceanic and Atmospheric Administration, Boulder, CO. Environmental Research Labs.
MESA Annual Report for FY76, February 1978, 19 p, 1 fig, 9 ref.

Descriptors: *Baseline studies, *Water quality control, *Resources development, *Pollution abatement, Waste water, Washington, *Puget Sound Project(Wash), Annual report, Flushing time.

During FY76 and 76T (Fiscal Transitional Quarter-July through September 1976), the energy-related activities have constituted the major effort of the project. MESA (NOAA) funds have been used for water-quality studies of the central basin of Puget Sound, for purchase of oceanographic hardware and instrumentation, and for administration and scientific management of the petroleum and wastewater field efforts. Research tasks undertaken for the energy-related project were based upon: the need to obtain baseline data prior to potential increases in contaminant level; the complexity and time required by the study; funding limitations; and the timing requirements of resource managers. Therefore, during the first year, research resources were primarily expended upon baseline and transport studies. The wastewater studies focused on identification of the scope of potential wastewater problems in the central basin of Puget Sound. The major effort, an investigation into the flushing time of the central basin, indicated the possibility of surprisingly short flushing times, under certain oceanographic and atmospheric conditions, however the water quality surveys found that certain of the shallow southern basins were subject to poor water quality, probably due to dinoflagellate blooms. Sea Grant Publication No. UNC-SG-78-02, April 1978. 60 p, 17 fig, 3 tab, 8 ref, 5 append. Also as NC Center for Marine and Coastal Studies Publication No. 78-1. SG-04-6-158-44054.

Descriptors: *Barrier Islands, *Inlets(Waterways), *Flow measurement, *North Carolina, Tidal waters, *Mathematical models, Model studies, U.S. East Coast.

A numerical model for computation of flow in inlets with junction is developed. The Galerkin techinque is coupled with a finite element analysis in the flow model. The vertically integrated equations of momentum and mass conservation are used with appropriate boundary and initial conditions. The junction conditions are introduced by the time rates of charge of energy and mass flux at the junction. A 'double sweep' approach is used in solving for the dynamics of flow. A parabolic shape function is adopted in the model to satisfy the requirement of linear independence. The numerical flow model is verified with field data for Carolina Beach Inlet, North Carolina. The tidal fluctuations in the inlet gorge and tidal velocities in the Atlantic Intracoastal Waterway were used as initial and boundary conditions respectively. The tidal velocities in the inlet gorge and tidal fluctuations in the Atlantic Intracoastal Waterway were computed with the numerical simulation flow model and compared with field data. The Galerkin finite element flow model performed well considering the complex nature of flow in a tidal inlet. (NOAA)

THE SUBMERGED VEGETATION OF LAKE PONTCHARTRAIN, LOUISIANA,
Army Engineer District, New Orleans, LA.
G. N. Montz.
Castanea, Vol. 43, No. 2, p 115-128, June, 1978. 6 fig, 1 tab, 9 ref.

Descriptors: *Submerged plants, *Louisiana, *Surveys, *Spillways, Aquatic plants, Rooted aquatic plants, Wetlands, Lakes, Discharge, Effects, *Lake Pontchartrain(LA).

The submerged vegetation was surveyed before and after the April 1973 opening of Bonnet Carre' Spillway. Abundant species were Vallisneria americana, ruppia maritima, and Najas guadalupensis. The study revealed approximately 2,000 acres of water-bottom covered with submenrged vegetation, the greatest potion o fwhich was recorded between Green point near Mandeville, and Big Point near Slidell, along the north-eastern shoreline of the lake. The release of fresh river water did not have observable effects on the submerged vegetation.(Stihler-Mass)

THE SHOALING OF BREAKWATER HARBOR, CAPE HENLOPEN AREA, DELAWARE BAY, 1842 TO 1971,
Delaware Univ., Newark. Coll. of Marine Studies.
J. M. Demarest, II.
Sea Grant Report No. DEL-SG-1-78, 1978 181 p, 29 fig, 3 tab, 32 ref, 2 append.

Descriptors: *Delaware, *Shoals, *Sedimentation, Harbors, Cape Henlopen(Del), *Delaware Bay.

The sedimentary processes in the breadwater Harbor-Cape Henlopen area were investigated. Toward this end, Shoaling rates, Changes in the pattern of shoaling with time, and shoreline changes were determined through bathymetric comparison, using survey data starting with the 1842 U.S. coastal survey map. In addition, information about modern conditions and processes in the study area were obtained through the determination of sediment distributions within the harbor and on the tidal flat, and by measurement of currents in two locations in the harbor. From the data thus obtained, the sedimentary processes responsible for the filling of the harbor and the effects of man-made structures on normal marine processes can be better understood. Therefore, data is presented for prediction of the future of Breakwater Harbor from a geologic viewpoint and for planning of the future of the harbor from a political-economical viewpoint. (NOAA)

A PROCESS AND PILOT PLANT DESIGN STUDY OF THE ABSORPTION FREEZING VAPOR COMPRESSION PROCESS.
Concentration Specialists, Inc., Andover, MA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 276, Price codes: A07 in paper copy, A01 in microfiche. Final Report, (OWRT/S-78/2), December 1977, 77 p, 30 fig, 9 tab, append. 14-34-0001-7530.

Descriptors: *Desalination apparatus, *Absorption Freezing Vapor Compression, *Desalination, *Waste water treatment, *Separation techniques, *Freezing, *Water purification, Pilot plants, Systems analysis, Technology, Engineering, Design, Heat pumps, Costs, Cost comparisons.

A design study of the Absorption Freezing Vapor Compression (AFVC) process for desalination and other concentration/separation treatments of waste water was conducted. The AFVC process overcomes one of the major problem areas in previous freezing processes by using a closed cycle refrigerant loop to power the absorption cycle, thus eliminating compressor problems caused by direct compression of refrigerants contaminated with sea water. The process maintains low energy requirements with absorption cycle powered by a heat pump. Power consumption of 42 and 38 kw-hr/1000 gal were calculated for 100,000 and 1 million gpd plants respectively. A 25,000 gpf pilot plant was designed which consists of three major process vessels: freezer/absorber; wash column/melter and generator; and equipment skids, one for refrigeration equipment and one for pumps, air removal equipment, and heat exchangers. Capital and operating costs were calculated for 100,000 gpd and 1 million gpd plants as well as for the pilot plant. The major advantages of the AFVC process are summarized: (1) low power consumption of freezing compared to heat processes, which is especially important in view of rising fuel costs; (2) less corrosion using epoxy coated mild steel and aluminum which are not completely suitable for evaporative process plants and are often replaced by more costly titanium in heat processes; (3) no pretreatment is needed to prevent scaling even with brackish water saturated with calcium sulfate. VAPOR COMPRESSION VERTICAL TUBE FOAM EVAPORATION,
California Univ., Berkeley. Seawater Conversion Lab.
H. H. Sephton.
Desalination, No. 23, p 299-310, 1977, 2 fig, 5 tab, 13 ref. (California Water Resources Center Project S-174).

Descriptors: *Evaporators, *Desalination apparatus, *Heat transfer, *Desalination, *Water reuse, *Economic feasibility.

Vertical tube foam evaporation (VTFE) has been shown to provide a 4- to 6-fold increase in the evaporation-side heat transfer coefficient, and evaporator performance enhancements ranging from 50 to 200 percent for downflow and upflow vertical tube evaporators using double-fluted aluminum-brass distillation tubes. This process relies upon the addition of 1 - 20 parts per million of a selected surfactant to the feed, and imposition of foamy two-phase vapor-liquid flow over the heat transfer surfaces. Recent data obtained with a new 5000 US gpd VTFE pilot plant operated by the vapor compression (VC) technique is reported, showing the promise of applying this technology to seawater conversion and water reuse, in comparison with a conventional VC-VTE operation. Test data include overall heat transfer coefficients obtained on several typical saline waters, showing that substantial capital cost and energy reductions are obtainable with VTFE. Capital costs are reduced as a consequence of the lower heat transfer surface area required by VTFE, and energy cost reductions follow from a reduction in the delta T and VC compression ratio provided by VTFE. F. Troyano Lobaton, R. Abadal Torruella, E. Baeza Benito, and C. Castaneyra Medina.
Agua, No. 81, p 12-24, Nov.-Dec. 1973. 6 fig.

Descriptors: *Desalinization plants, *Water supply, *Water sources, Costs, Fuerteventura, Canary Islands, Spain.

Fuerteventura is the most arid of the Canary Islands and its economic development had been restrained by an extremely scarce water supply. Prior to 1977, water was provided from wells with high levels of salinity. Surface water resouces are too scarce to provide and adequate supply. The desalinization of sea water was the only alternative that could substantially increase the water supply. A desalinization plant was constructed and began to operatin in 1977, permitting the island to expand its tourist industry. High costs are the major problem with this method of water supply the financial responsibility for further expansion of the supply should rest upon the water users. (Russell-Arizona)

GEOTHERMAL ACTUATED METHOD OF PRODUCING FRESH WATER AND ELECTRIC POWER,
J. M. Edmondson, and M. H. Smoot.
U.S. Patent No. 4,091,623, 9 p, 4 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 970, No 5, p 1654, May 30, 1978.

Descriptors: *Patents, *Geothermal studies, *Potable water, Water treatment, Condensation, Equipment, Heat exchangers, Electric power production, California, Saline water, Salton Sea(CA).

The salt content of water in the Salton Sea has increased in recent years to a level that is highly detrimental to marine life. By use of the invention, the Salton Sea may be reclaimed as a desirable environment for marine life. The method may be carried out by sequentially withdrawing water from the Salton Sea, distilling a portion of the withdrawn water by utilizing heat from the nearby geothermal sources, returning fresh potable distilled water to the Salton Sea, saline water to the geothermal reservoir, and concurrently generating electric power as the operation is carried out. A bore hole is formed in the earth adjacent a natural body of saline water such as the Salton Sea. The bore hole has pressurized mineral-containing fluid discharging at a temperature of greater than 212 degrees F. A closed reservoir is provided to which saline water can flow, preferably by gravity. Pressurized fluid from the geothermal source has a sufficient heat content that it tends to flash into steam when discharged into the reservoir under reduced pressure. The partially condensed steam and condensate flows to a heat exchange where condensation of steam to water is completed. In another form of the invention steam discharging from the closed reservoir is used to transform a low boiling point liquid to pressurized vapor that is used to drive a gas turbine that is connected to an electric generator. (Sinha-OEIS)
W79-00826

THERMAL POWER STATION COMBINED WITH A PLANT FOR SEAWATER DESALINATION,
Brown, Boveri and Co. Ltd., Baden (Switzerland). (Assignee).
H. Pfenninger.
U.S. Patent No. 4,094,747, 5 p, 2 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 971, No. 2, p 680, June 13, 1978.

Descriptors: *Patents, *Desalination, *Water purification, Sea water, Heat exchangers, Condensation, Distillation, Thermal power plants, Turbines, Steam turbines, Gas turbines.

The object of the invention is to utilize economically the exhaust heat of a gas turbine while retaining the good efficiency of the gas turbine, to which is connected a heat exchanger for supplying heat to a seawater desalination plant. This object is achieved in that the heat exchanger is in the form of a waste heat boiler with, on the water side, two separate sections of which that section utilizing the high exhaust gas temperatures is used to generate steam for a steam turbine, and the second section constitutes directly or indirectly the heat source for the seawater desalination plant. An improvement in overall thermal efficiency is obtained by combining the gas turbine with a steam turbine. The exhaust gas outlet temperatures from the section of the boiler used to generate steam for the steam turbine are about 180-200C, which allows an optimum configuration for the entire steam section. The temperature difference between the two flow media in the steam-generating section of the boiler can then be chosen more favorably. The lower exhaust gas temperatures after the first boiler section are also very well suited to the second boiler section, which is used to generate high-temperature hot water for the desalination plant or to heat the seawater directly. This report covers 1975-1976 fiscal year activities of the University's desalination program funded through the University of California Water Resources Center, and indicates related activities funded by other agencies. It is a compilation of synopses of ongoing research at two Californian universities, Berkeley and Los Angeles. Research topics at Berkeley include distillation studies using solar or geothermal energy, foam fractionation and flotation studies, membrane processes, ion exchange, and other subjects. Reported activities at Los Angeles are saline water demineralization by means of a semipermeable membrane, corrosion of metals and alloys in seawater, scale control studies and others. Each synopsis lists the study staff, briefly describes the up to date activities in each topic category, and lists study publications and other relevant references. Appendices list personnel, publications, reports, and theses. (Coan-NC)

PREPARATION OF ION-EXCHANGE MEMBRANES WITH EXTREMELY LOW AREAL RESISTANCES.
Southern Research Inst., Birmingham, AL.
Available from the National Technical Information Service, Springfield, VA. 22161 as PB-288 391, Price codes: A01 in paper copy, A01 in microfiche. Report OWRT/S--78/6, Final Report No. SoRI-EAS-78-303, June 6, 1978. 49 p, 1 fig, 11 tab, 14 ref. 14-34-0001-7518.

Descriptors: *Desalination, *Membrane processes, *Water purification, *Cation exchange, *Anion exchange, Separation techniques, Ion exchange, Saline water, Water quality control, Areal resistance, Polymers, Research and development, Saline water, Desalination apparatus, Water quality control.

Methods of preparing cation- and anion-exchange membranes with low areal resistances were developed for use in lower cost desalination of sea water. Membranes of both types were prepared having the desired resistance of 1 ohm-sq cm or less. Preparation involved using reinforcements to strengthen polymer compositions which had low resistances and acceptable selectivities, but which were weak and dimensionally unstable. The reinforcing materials were non-woven fabrics with high void volumes. In 1 N sodium chloride (NaCl) the best experimental cation-exchange membranes that could be made consistently had transference numbers of 0.76 to 0.79, compared to commercial membranes with a range of about 0.85 to 0.87. The best experimental anion-exchange membranes had transference numbers of 0.90, the same as commercially available membranes. It is recommended that further work is needed on cation-exchange membranes to improve transference numbers and prepare thinner (about 6-mil) membranes. With anion-exchange membranes already having acceptable transference numbers, it is recommended that thinner membranes should be prepared and evaluated at various temperatures. (Majtenyi-IPA)

RESEARCH ON IN SITU-FORMED CONDENSATION POLYMER FOR REVERSE OSMOSIS MEMBRANES,
Midwest Research Inst., Minnetonka, MN. North Star Div.
J. E. Cadotte, M. J. Steuck, and R. J. Petersen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 387, Price codes: A05 in paper copy, A01 in microfiche. Final Report OWRT/S--78/8, March 1978. 47 p, 1 fig, 14 tab, 8 ref. 14-34-001-6521.

Descriptors: *Desalination, *Desalination processes, *Reverse osmosis, *Membrane processes, Water purification, Polymers, Polypiperazineamides, Crosslinking, Polysulfone-sulfonic acids, Vinyl polymers, Acrylic polymers, Research and development, Saline water, Desalination apparatus, Polymerization, Chemical reactions, Water quality control.

Development of chlorine-resistant reverse osmosis membranes for use in desalinization of sea water was carried out using in situ formation of a thin, dense coating on a microporous support. Three types of polymer systems were studied: polypiperazineamide membranes formed by interfacial deposition, membranes formed by crosslinking, water-soluble polysulfone-sulfonic acids in situ, and linear vinyl or acrylic polymer membranes crosslinked in situ by chemical reactions or ultraviolet radiation. Most promising results were obtained with polypiperazineamide membranes which were prepared with fluxes of 20 to 28 gfd at a salt rejection of about 98%, tested at 1500 psig in 3.5% synthetic sea water. One variation of this method produced a membrane with salt rejection of 99.3%. A second variation still under investigation gives good chlorine resistance, extremely high flux, and good rejection of polyvalent ions but is not able to perform acceptably in rejecting monovalent ions. Polysulfone-sulfonic acid membranes were chlorine resistant but salt-rejections above 90% could not be obtained. Vinyl and acrylic polymers crosslinked on microporous polysulfone supports gave low fluxes in general unless severe crosslinking reactions were used and these often introduced chlroine sensitivity. (Majtenyi-IPA)

3B. Water Yield Improvement

THE PROBLEM OF WATER,
Weizmann Inst. of Science, Rehovoth (Israel).
Yosef Ben Mordechai.
Rehouot, Vol. 8, No. 1, Spring 1976, p 20-24.

Descriptors: *Water resources development, *Water policy, *Water management(Applied), Water distribution(Applied), Desalination, Hydrography mapping, Pollutants, Water reuse, Brackish waters, Forecasting, *Israel.

Because Israel is a semi-arid country, an intelligent water policy is a necessity for survival of the state. It is required that this policy be based upon an estimation of present and future needs, proper management and distribution systems, waste water usagy, desalination, and mapping of resoures. Accordingly, these problems are presently receiving priority sdtatus by the major research centers: The Weismann Institute, the Technion, the Hebrew university, and the Negev Research Institute. The Academic community is

attacking the probelm on two fronts: (1) mapping water supplies including the identification of the various polluting elements, and (2) developing techniques for either the reusage of wastewaters or for generating potable water from the sea or inland brackish sources. Moedern approaches ad techniques being investigated are reviewed here with emphasis placed upon the particular needs of this rapidly developing country. (Tckes-Arizona)

DESERTIFICATION AND TECHNOLOGICAL ADJUSTMENT IN THE MURRAY MALLEE OF SOUTH AUSTRALIA,
Oxford Univ. (England). School of Geography.
M. Williams.

Descriptors: *Deserts, *Australia, *Desertification, *Arid lands, Agricultural engineering, Environmental engineering, Manpower, Mechanical equipment, Transportation, Erosion control, Droughts, Biological components, Land tenure, Grazing, Economic justification, Economic feasibility, Range management, Grasses, Legumes, Land management, Land use, Social aspects, Social effects, Social participation.

Farming has been practiced in Murray mallee in southern Australia since before the beginning of this century. Although once productive and successful, economic decline, poor management and drought since 1930 have turned the 26,000 Km2 area into a badly eroded marginal area. Attempts at rejuvenation of this deteriorated region constitute a broad-based attack including alteration of the structural framework of farming, improvement of the biological components and alteration of the mechanical and technological basis. Under the 'Marginal Lands Scheme' the director of agriculture has reduced the number of land holdings by half and reduced cropping to one year in three or four on any given piece of land with the fallow years being used for sheep grazing. The consequent increase in the average size of land holding has created more economically and environmentally viable working units. Biologically, new grass and leguminous pastures have replaced the previously widespread sowing of grains and have provided the needed diversification to stabilize the region. Mechanically, the adoption of tractors since the 1950's has increased the area per worker without reducing the total number of workers. As holdings have become larger and more fragmented the farmer and his family have been required to make the necessary social and economic adjustment. Further travel is necessary to reach both work and services, local services are more costly and sparse, population declines, and people move to the urban areas. Despite these adjustments, rainfall uncertainty and potential desertification remain as factors to be coped with. (Tickes-Arizona)

FEASIBILITY OF RAINWATER COLLECTION SYSTEMS IN CALIFORNIA,
California Univ., Berkeley. Sanitary Engineering Research Lab.
D. Jenkins, and F. Pearson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 378, Price codes: A04 in paper copy, A01 in microfiche. Technical Completion Report, Contribution No. 173, California Water Resources Center, August 1978, 55 p, 52 fig, 18 tab, 10 ref. (California Water Resources Center Project UCAL-WRC-W-539).

Descriptors: *Rain water, *Water sources, *Water supply, *Rain, Domestic water, Feasibility studies, *California, *Rainwater collection systems, Collection systems, Rainfall, *Alternative water use, Water treatment, Estimating.

The northern California drought of 1975-77 emphasized the need to explore alternatives for water supply. This research examined the feasibility of collecting rainwater for domestic consumption from roof areas into storage tanks. Rainfall records for 13 representative California locations were analyzed to provide a basis for estimating the supply of water from rainwater collection systems. Standard statistical measures of central tendency, distribution and variation, as well as serial correlation, were remarkably consistent. A single relationship emerged which expressed the yield of rainwater supply systems for all locations in terms of annual rainfall, collection area, and storage tank capacity for different levels of system reliability. Because of the high cost of the large storage tank needed for a completely reliable rainwater supply system to sustain even a minimal domestic demand, the most economical supply system will generally involve use of rainwater during the wet season, supplemented from other sources during dry periods. The concentration of lead in rainwater near urban areas frequently exceeds the recommended limit for drinking water, which would imply that rainwater supply systems are feasible only in rural areas. Microbiological contamination of rainwater results from bird droppings on the collection area, but chlorine disinfection proved effective. Turbidity can be removed to below the limit recommended for drinking water by a process of alum coagulation and settlement, feasible on a household scale. (Snyder-Calif, Davis)

WATER CONSERVATION INFORMATION DISSEMINATION DURING 1977 DROUGHT EMERGENCY,
Utah Center for Water Resources Research, Logan.
L. D. James, and W. H. Andrews.
Utah Water Research Laboratory, Water Resources Planning Series Report P-78-002, June 1978, 235 p, 27 tab, 3 append. OWRT T-0021 (7706)(1).

Descriptors: *Droughts, *Water conservation, Range management, *Water harvesting, Water reuse, Groundwater mining, Irrigation, Erosion, *Information exchange, *Information dissemination, Water distribution(Applied), Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming.

As drought conditions in 1976 and 1977 became increasingly severe throughout the west and affected many other parts of the country, many states began special drought information dissemination efforts. This study was organized to provide a forum for the exchange of information among the respective states that could reduce duplication among independent efforts. The project collected information on: (A) Water-user conservation practices, (1) domestic use, (a) inside use, (b) outside use, (2) industrial, (3) commercial, and (4) irrigation; (B) Water-supplier management practices, (1) water conservation inducements, (2) emergency supply augmentation, (a) groundwater mining, (b) water harvesting, (c) water reuse, (3) reallocation among uses or users; (C) special drought problems, (1) livestock and range management, (2) effects on fish and wildlife, (3) fire danger, (4) effects on recreation, (5) energy effects (reduced generation and additional use), (6) effects of resulting changes in water quality including salinity, and (7) wind erosion. Types of information included (1) research results contributing to dealing more effectively with emergency drought situations, (2) research currently underway, (3) brochures or other material prepared for public distribution, (4) reports of extension agents or other technical personnel working with the public to solve drought problems, and (5) user or expert statements recommending supplementing or revising any of the above. This report contains 667 abstracts and a snythesis of the information obtained on each topic.

3C. Use Of Water Of Impaired Quality

ANTIVIRAL SUBSTANCES FROM CALIFORNIA MARINE ALGAE,
California Univ., Berkeley. Naval Biosciences Lab.
D. W. Ehresmann, E. F. Deig, M. T. Hatch, L. H. DiSalvo, and N. A. Vedros.
Journal of Phycology, Vol. 13, 1977, p 37-40. 2 tab, 14 ref. Sea Grant R/MP-12.

Descriptors: *Viruses, *Viricides, *Rhodphyta, *Algae, *Herpes simplex, *Coxsackie B5, Marine algae, Seaweeds, California, Coasts, Intertidal areas, Constantinea simplex, Polysaccharides, Farlowia mollis, Human diseases, Diseases, Public health.

Extracts of 28 species of intertidal marine macroscopic algae collected during low tide between 1971-75 in various northern California coastal habitats were examined for pharmacological activity against 12 mammalian viruses. The algae represented Chlorophyta, Phaeophyta, and Rhodophyta. Ten rhodophytes (red algae) contained substances which caused greater than a two-log reduction in infectivity of Herpres simplex virus types 1 and 2: Constantinea simplex, Cryptosiphonia woodii, Endocladia muricata, Farlowia mollis, F. crassa, F. compressa, Pikea pinnata, Leptocladia conferta, Cryptopleura violacea, and Nienburgia andersoniana. Constantinea simplex agent in extracts from C. simplex and Farlowia mollis was determined to be a structural polysaccharide on the basis of physical and chemical properties. Many of the active algae were members of the family Dumontiaceae (Cryptonemiales). Algal species which exhibited no antiviral activity by the methods used were: Ulva lactuca, Egregia menziesii, Cystoseira osmundacea, Fucus furcatus, Pelvetia fastigiata, Porphyra lanceolata, Calliarthron setchelliae, Corallina gracilis, Prionitis lanceolata, P. linearis, Agardhiella coulteri, Gigartinia canaliculata, Iridaea flaccida, I. heterocarpum, Halosaccion glandiforme, Rhodymenia lobulifera, Laurencia spectabilis, and Rhodomela larix. This study represents the first published survey of marine macroscopic algae for antiviral substances. (Lynch-Wisconsin)

SALINISATION IN THE SOUTHWEST OF WESTERN AUSTRALIA,
Western Australia Dept. of Conservation and Environment, Perth.
M. J. Mulcahy.
SEARCH, Vol 9, No 7 p 269-272, July 1978. 2 fig, 28 ref.

Descriptors: *Australia, *Laterites, *Salinization, *Vegetation effects, *Land management, Saline water, Saline soils, Pasture management, Environmental effects, Evaporation, Groundwater recharge, Water conservation, Water quality, Water pollution sources, Soil contamination, Drainage practices, Geomorphology.

Salinisation in the southwestern region of Western Australia is a problem caused largely by the replacement of indigenous deep-rooted vegetation with shallow-rooted crop ad pasture plants. The effect of clearing these areas for the sowing of selected agricultural crops has been a decrease in the amount of water lost by evapotranspiration ad the consequent increase in the volume of water available for groundwater recharge, discharge into streams, and for movement overland or at shallow depths beneath the soil surface. High soil and groundwater salt concentrations result. Variable landscape zonation in Western Australia is a cause for different levels of response or suseptibilities to these problems. Zones of dissected laterities, bauxitic laterities and lateritic sand plainsand salt

lakes are anayzed separately and an association is found between laterization of shield rock and degree of salinization present. With the exception of Kangaroo Island in southern Australia, salinisation does not apppear to be a major hazard on lateritic landscapes. (Tickes-Arizona).

MANAGEMENT OF BRACKISH WATERS IN ARID LAND AGRICULTURE: MODERN EXPERIENCES WITH ANCIENT PROBLEMS,
Ben Gurion Univ. of the Negev, Beersheba (Israel). Research and Development Authority.
M. Twersky.
Arid Lands Newsletter, No. 4, p 1-7, October 1976. 6 fig, 4 tab, 48 ref.

Descriptors: *Brackish water, *Arid lands, *Irrigation practices, Economic feasibility, Soil contamination, Water pollution sources, Soil-water-plant relationships, Water quality, Salinity, Flood irrigation, Trickle irrigation, Sprinkler irrigation, Management, Land management, Irrigation techniques, Israel.

The recent development of brackish water irrigation technologies are making it economically and physically possible to farm the arid and semi arid regions of the world. Proper use of brackish waters requires a thorough knowledge of soil and crop vulnerability to the various water and soil pollutants indigenous to the area of application. Accordingly, this author reviews the water quality and salinity criteria necessary to use marginal water supplies. A brief discussion of surface (flooding, furrow and sprinkler) sprinkler and trickle irrigation is presented with a discussion of the adaptive techniques and problems of each. Aiding the modern farmer in the utilization of these techniques is the development of management concepts and tools such as more accurate salinity measurement indicators, automatic irrigation control systems, high frequency irrigation techniques, means of optimizing chemical and fertilized application, and advances in the selection of varieties with higher genetic potential. (Tickes-Arizona)

WATERLOGGING AND SALINISATION IN IRRIGATED SEMI-ARID REGIONS OF NSW,
S. Pels.
SEARCH, Vol. 9, No. 7, p 273-276, July 1978. 2 fig.

Descriptors: *Saline water, *Drainage systems, *Australia, *Salinity, Brackish water, Saline water systems, Water pollution sources, Saline water intrusion, Seepage, Mixing, Chemical properties, Drainage practices, Tile drains, Tubewell drains, Salt water movement, Leaching, Water table, Waterlogging, Arid lands.

Irrigation, required in desert regions to practice agriculture, must be carefully managed to avoid salination and waterlogging and the consequent destruction of productive land. Salinisation and poor drainage are inherent problems in western New South Wales where subsoil and groundwater salinities are high. The addition of water through irrigation causes an imbalance in the hydrological equilibrium present in these desert areas and proper drainage schemes must be found to allow for leaching of imported salts and to reduce the occurrence of high water tables and waterlogging. Four case studies are presented: the Wakool irrigation district, the Curlwaa irrigation area, the Mildura Weir and the Reverine plains, to illustrate both causes and remedies for these problems. The use of tile and tubewell drainage techniques as well as the multiple use of irrigation and drainage waters are explained and illustrated. In areas where salt levels are particularly high, drainage waters must be conveyed to inland regions for evaporation. Problems such as these exist in many arid regions and semi arid regions throughout the world and through investigation followed by ameliorative measures are required to avoid widespread desertification and destruction of productive land. T. J. Suen, and A. J. Begala, Jr.
U.S. Patent No. 4,092,244, 6 p, 1 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 970, No 5, p 1856, May 30, 1978.

Descriptors: *Patents, *Industrial water, *Cooling wate, Recirculated water, Scaling, Corrosion, Chemical reactions, Water reuse, Recycling.

A chemical composition and a process for inhibiting corrosion and scaling on metal surfaces in industrial cooling water systems is disclosed. The process includes the addition to he cooling water of from 10 to 200 ppm of an alkyl polyethoxy compound having a free carboxylate, sulfonate or phosphonate group. In some preferred embodiments, 10 to 500 ppm of a mineral oil is added to the water system, in addition to the polyethoxy compound. (Sinha-OEIS)

Descriptors: *Drought tolerance, Crop production, *Irrigation effects, African, Bahia, Bermuda, Buffel, *Grass, *Growth rates, height, Leaf, Millet, Panic, Plant physiology, Rhodes, Sorghum, Sudan, Tillers, Wilting, *Soils(Mineral).

Most of the species in the nonirrigated plot temporarily wilted; stem elongation and leaf expansion were retarded during the drought period, late July. The species recovered rapidly from drought injury after a rainfall. Yield increase by irrigation was generally high at the time of 1st cutting after irrigation (Aug.), but became lower at the 2nd and 3rd cutting after irrigation (Sept. and Oct.). Drought resistance was evaluated with decrease in yield, plant height and leaf area in bermuda grass, bahia grass, love grass (broad leaf type), rhodes grass, panic grass, barnyard grass, sorghum, African millet, buffel grass, sudan grass and blue panic (perennial). Drought resistance evaluated with the witling degree seemed to be high in bermuda grass, blue panic and buffel grass. For most grasses water content and stem ratio of irrigated forages were higher than those of non-irrigated ones. Irrigation accelerated the elongation of regrowing stems and the development of new tillers in the initial stage of regrowth, but generally had little influence on the total number of tillers in the final stage.--Copyright 1978, Biological Abstracts, Inc.

United Nations Educational, Scientific and Cultural Organization (USSR). Scientific Council on the Problems of Deserts.
V. N. Nikolaev.
Man and the Biosphere, USSR Academy of Sciences, p 1-17, Moscow, 1977.

Descriptors: *Pastures, *USSR, *Rotations, *Pasture management, Forages, Carrying capacity, Grazing, Arid lands, Land use, Deserts, Administrative organization, Land management techniques.

Although natural pastures in the desert regions of the U.S.S.R. are sparsely vegetated and excessively arid due to scarce rainfall confined to winter and autumn, they can be utilized as important sources of natural fodder for sheep and camels. Soviet scientists have worked out management plans designed to reduce the detrimental effects of natural and anthropogenic desertification in these areas. A brief history of the reclamation and use of pastures in the U.S.S.R is presented in two parts: use of pastures in the pre revolutionary period, and usage since the October socialist revolution. The former period was characterized by the nomadic herding of animals, managed only by the location of watering sites. In contrast, the second post revolution period has been dominated by planned and consistent reclamation efforts to restore the natural desert fodder. These reclamation and management techniques have been based upon more efficient interfarm organization and distribution of desert pastures and a series of rotational grazing schemes. These techniques and their successes are illustrated. (Tickes-Arizona)

O. B. Williams.
SEARCH, Vol. 9, No. 7, p 257-261, July 1978. 4 fig, 1 ref.

Descriptors: *Range management, *Australia, Agro-meteorology, Vegetation effects, Environmental effects, Vegetation establishment, Erosion, Land reclamation, Monitoring, Grazing, Overgrazing, Pasture management, Carrying capacity, Livestock, Sheep, Biodegradation.

Annual rainfall for this area is about 200 mm. Vegetation is predominantly an extensive high shrubland, with ground layer of either annual grasses, sparse perennial grasses or small chenopodiaceous shrubs. The basin is largely pastoral, little changed since its initial settlement a century ago. Recent investigations based on several parameters of degeneration, erosion, overgrazing, a takeover by undesirable vegetation, etc., resulted in recommendations for a reduction in numbers of sheep, withdrawal of seriously damaged rangeland from grazing, and restrictions on grazing some land classified as 'a risk.' Experience indicates that research should be concentrated on the regeneration of desired species on less degraded portions of the more productive rangelands. the authors point out that monitoring sites are on grossly degraded rangeland, a usual procedure in most countries and a singularly unproductive one for pastoralist and research workers. SPRINKLER IRRIGATION SYSTEM AND APPARATUS FOR DIRECTING A STREAM OF WATER INTO THE ATMOSPHERE,
Nelson Irrigation Corp., Walla Walla, WA. (Assignee).
B. R. Nelson.
U.S. Patent No. 4,091,996, 11 p, 8 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 970, No 5, p 1781, May 30, 1978.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Irrigation systems, Irrigation effficiency, Flow control, Application equipment.

A method is described of directing a source of water under pressure, which may vary within a wide range of pressures above a predetermined minimum pressure, at a substantially constant rate of flow into the atmosphere for purposes of sprinkler irrigation. The water under pressure flows through the inlet to deform a resilient annular member an amount proportional to the amount such water pressure is in excess of the predetermined minimum pressure and by such deformation to reduce the size of the opening. A constant amount of water per unit time is contained in the stream through the sprinkler irrigation system. (Sinha-OEIS)
W79-00829

ROTARY SPRINKLER ARC ADJUSTMENT,
Telsco Industries, Inc., Dallas, TX. (Assignee).
H. C. Ridgway.
U.S. Patent No. 4,091,997, 7 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 970, No 5, p 1781, May 30, 1978.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Irrigation efficiency, Irrigation practices, Application equipment, Water delivery.

An arc adjustment easily and positively maintains the arc through which a rotary sprinkler operates. The system includes a rotatable nozzle supported from a shaft with the reversing mechanism attached to the nozzle and extending from the nozzle in the direction of the shaft. A notched ring or gear is attached to the shaft below the nozzle. A first wire locking collar has one end encircling the shaft above the notched ring and the opposite end formed in a loop extending radially from the shaft and terminating in a lateral end section for engagement with the notches of the ring. The locking collars are positioned so that the loops intercept the acutating arm of the reversing mechanism as the nozzle of the rotary sprinkler rotates on the shaft. The locking collars are positioned to any selected point. (Sinha-OEIS)
W79-00830

WATER DISPENSING APPARATUS,
A. K. Kock.
U.S. Patent No. 4,092,996, 11 p, 8 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 971, No 1, p 97, June 6, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation practices, *Irrigation efficiency, Application equipment, Water delivery, Pipes.

This invention is based on the concept of using two substantially identical, extendible and collapsible pipe-systems arranged to conduct water from a water source to one or more water sprays. Each system of pipes is constructed of a number of substantially rigid pipes and pipe-coupling devices which pivotally connect the pipes at the ends to permit water to flow from pipe to pipe through the coupling devices. The system of pipes is held together by holding means and is carried above the surface of the ground by supporting means. The pipe-systems can be provided with means for moving the systems automatically along a reciprocating path of pre-determined length. The speed at which the pipe-systems reciprocate and, also, the volume of water dispensed can be pre-set. (Sinha-OEIS)
W79-00834

IRRIGATION TOWER DRIVE,
G. C. Knutson.
U.S. Patent No. 4,093,036, 6 p, 8 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 971m No 1, p 110, June 6, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation efficiency, Application equipment, Conveyance structures, Irrigation operation and maintenance, Irrigation towers, Drive mechanisms.

Irrigation towers utilized in irrigating cultivated land are usually provided with support and drive wheels capable of slowly advancing the tower over the land to be irrigated. Inasmuch as the tower wheels are driven very slowly various operating problems are encountered. The irrigation tower drive mechanism of this invention utilizes a sufficiently numerically high ratio drive train to reduce the tendency of the tower to overdrive the drive train when the tower is proceeding down an incline and a drive mechanism which is constructed in a manner tending to reduce surges in torque applied to the support and drive wheels of the tower. In addition, the drive system is constructed in a manner where the portions subject to malfunction are completely enclosed within a housng having wet sump lubrication. (Sinha-OEIS)
W79-00835

IRRIGATION PIPE LAYING AND PICK UP VEHICLE,
M. A. Goodsell.
U.S. Patent No. 4,093,082, 8 p, 7 fig, 17 ref; Official Gazette of the United States Patent Office, Vol 971, No 1, p 125, June 6, 1978.

Descriptors: *Patents, *Irrigation, *Irrigtion practices, *Irrigation efficiency, Irrigation operation and maintenance, Equipment, Pipes, Operations, Pipe laying equipment.

In order to make maximum use of irrigation piping it is moved from field to field as the need for irrigation changes. Therefore, it is desirable to have a vehicle specifically designed for picking up and laying irrigation pipe which reduces the manpower and equipment reqired to accomplish the task. This invention describes a self-propelled vehicle having a centrally mounted inclined guide trough for guiding pipe sections as the vehicle is driven along a row of attached pipe sections. The sections are guided upwardly to the level of a working platform. An angulation trough contacts the end of a pipe section an angulates a first pipe section relative to the next section so that the first section can be disconnected. Disconnected sections are placed in racks on either side of the platform. The two ends of the guide trough have different inclinations to aid in the assembly of the pipe sections when laying pipe. (Sinha-OEIS)
W79-00836

IRRIGATION APPARATUS,
O. DeRomano.
U.S. Patent No. 4,094,466, 3 p, 5 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 971, No 2, p 590, June 13, 1978.

Descriptors: *Patents, *Irrigation, *Subsurface irrigation, Irrigation systems, Irrigation efficiency, Application equipment, Diffusion.

A device for underground drainage and irrigation of soil includes a porous element which can be engaged about a distribution pipe at a perforation or opening in the pipe. Apertures in a pipe distribution system can be provided in two ways. In the first instance, a space may be provided between the ends of two separate, aligned pieces of pipe. The porous filter or diffusion member can be in the form of a flange connector joining the two adjacent pipe sections. Or the flow passages or apertures are formed by perforating a pipe at selected locations. The location and size of the perforations are selected according to the desired characteristics of the system. The apertures are selected according to the desired characteristics of the system. The apertures are then covered by a porous element permitting flow to be dispersed across the aperture and through the element. The individual porous elements are comprised of a quantity of small plastic particles, as for example, pellets of polyvinylchloride, sintered by application of heat, pressure or a bonding agent. The sintering leaves interstitial spaces to allow passage of fluid through the element. (Sinha-OEIS)
W79-00844

SPRINKLER HEAD SELECTIVELY OPERABLE IN A PART-CIRCLE MODE OR A FULL CIRCLE MODE,
Nelson Irrigation Corp., Walla Walla, WA. (Assignee).
L. P. Meyer.
U.S. Patent No. 4,094,467, 10 p, 5 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 971, No 2, p 590, June 13, 1978.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Irrigation efficiency, Application equipment, Water delivery.

A sprinkler head having a reversing mechanism cooperable with spaced cam assemblies for effecting part circle mode operation in which the cam element of one of the cam assemblies is selectively movable by a spring pressed over center toggle linkage between two position, one of which causes the sprinkler head to operate in a part circle mode and other of which causes the sprinkler head to operate in a full circle mode. (Sinha-OEIS)

DECISION THEORY APPLICATIONS AND IRRIGATION OPTIMIZATION,
California Univ., Davis. Dept. of Civil Engineering.
M. J. English, and G. T. Orlob.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 436, Price codes: A04 in paper copy, A01 in microfiche. Contribution No. 174, Water Resource Center, Technical Completion Report September 1978, 48 p, 24 fig, 9 tab, 66 ref. (California Water Resources Center Project UCAL-WRC-W-538).

Descriptors: Irrigation, Economics, *Computer models, *Economic efficiency, *Irrigation efficiency, *Optimization, *Irrigation water use, *Water utilization, *Risks, Water supply, Decision making, Crop production.

This research concerns economic optimization of irrigation water use. Statistical decision theory is employed in the analysis, and particular attention is given to questions of uncertainty and utility. A general analytical model for dealing with the complex uncertainties in the relationship between irrigation water use and net farm income is developed. Non-linear utility functions are approximated by quadratic polynomials, leading to a simplified analysis of the decision problem in terms of mean and variance of net farm income. The analysis is extended to include portfolio combinations of two crops. The theoretical framework is applied to a case study involving farmers operating with a limited water supply. Optimal cropping patterns are selected for each of seven farmers. The cropping patterns considered include various combinations of two different crops and fallow land. Case study results indicate that a decision theoretic approach to irrigation optimization will lead to optimal irrigation strategies that may differ substantially from strategies selected without regard for uncertainty and utility. These optimal strategies will be more consistent with the preferences of the individual farmers. (Snyder-Calif, Davis)
W79-00857

ECONOMIC BENEFITS TO AGRICULTURE IN THE SAN JOAQUIN VALLEY DUE TO LONG-TERM PREDICTION STREAMFLOW FORECASTING,
California Univ., Los Angeles. Dept. of Engineering Systems.
M. J. Cohn.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 377, Price codes: A04 in paper copy, A01 in microfiche. Master of Science in Engineering Thesis, 1978. 50 p, 11 fig, 4 tab, 16 ref, 3 append. (California Water Resources Center Project UCAL-WRC-W-535).

Descriptors: Surface runoff, *Groundwater, *Costs, *Mathematical models, Groundwater recharge, California, Agriculture, Benefits, *Streamflow forecasting, *Economics, *San Joaquin Valley(Calif).

A mathematical model of a surface water and ground water system is developed to study agricultural benefits for various uncertainties of long-range streamflow forecasting. Both optimization and simulation techniques were used to solve the problem considering cost of water as a parameter. The model is specifically formulated to study San Joaquin Valley State Water Project Service Area agricultural benefits. Fifty years of historical data are routed through the State Water Project and Central Valley Project year 2000 level operation to obtain surface water deliveries. Three studies were evaluated: (1) sensitivity of benefits to increased or decreased historical flows, (2) effect of long-term (one year) streamflow prediction uncertainties on benefits and (3) effect of constant estimated streamflow on benefits. It is concluded that maximum benefits occur when maximum cotton acreage is planted every year. (Snyder-Calif, Davis)

AQUATIC FORAGE PROCESSING IN FLORIDA,
Florida Univ., Gainesville. Dept. of Agricultural Engineering.
L. O. Bagnall, T. W. Casselman, J. W. Kesterson, J. F. Easley, and R. E. Hellwig.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol. 20, No. 2, p 221-225, 1977. 4 fig, 4 tab, 21 ref. OWRT A-017-FLA(9), 14-31-0001-3809.

Descriptors: Drying, Chemical analysis, Nutrients, Digestion, *Aquatic weeds, *Water hyacinth, *Rooted aquatic plants, Animal physiology, Toxins, Feeds, *Florida, *Hydrilla.

The aquatic weeds, water hyacinth (Eichhornia crassipes) and hydrilla (Hydrilla verticillata), were chopped, mechanically dewatered, dehydrated and pelleted to determine whether they could be processed effectively and efficiently in existing processing systems and components. Pressing removed 60 to 80 percent of the water and 18 to 38 percent of the dry matter. The pressed products were difficult to dry rapidly and pellet. (Morgan-Florida)

BIOLOGICAL CONTROL OF AQUATIC WEEDS WITH PLANT PATHOGENS,
Florida Univ., Gainesville. Dept. of Plant Pathology.
T. E. Freeman.
Aquatic Botany, Vol. 3, p 175-184, 1977. 1 tab, 47 ref. OWRT A-033-FLA(3), 14-34-0001-7020.

Descriptors: *Biocontrol, Water weeds, *Plant pathogens, *Aquatic weed control.

Plant pathogens have characteristics that make them desirable candidates as biological control agents for aquatic weeds. They are: (1) numerous and diverse; (2) often host specific; (3) easily disseminated and self-maintaining; (4) capable of limiting populations without eliminating the species; and (5) non-pathogenic to animals. Recent investigations have revealed several pathogens with biocontrol potential. The algal viruses and the water hyacinth (Eichhornia crassipes (Mart.) (Solms-Laub.) pathogens, Acremonium zonatum (Sawada) Gams, Bipolaris stenospila (Drechs.) Shoemaker, Cercospora rodmanii Conway, Rhizoctonia spp and Uredo eichhorniae Fragoso and Ciferri have been studied the most extensively and appear to hold promise as biocontrol agents. FLOODS IN KANSAS CITY, MISSOURI AND KANSAS, SEPTEMBER 12-13, 1977,
Geological Survey, Rolla, MO. Water Resources Div.; and Geological Survey, Topeka, KS. Water Resources Div.
L. D. Hauth, and W. J. Carswell, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A057 486, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-63, May 1978. 36 p, 16 fig, 2 tab, 4 ref.

Descriptors: *Floods, *Flood data, *Flood damage, *Peak discharge, *Flood profiles, Gaging stations, Streamflow, Rainfall-runoff relationships, Flood frequency, Hydrologic data, Hydrographs, Missouri, Kansas, *Kansas City area.

The storm of September 12-13, 1977, produced as much as 16 inches of rainfall in the Kansas City, Missouri-Kansas area, left 25 persons dead, many homeless, and over 50 million dollars in damages. Flood hydrographs taken from U.S. Geological Survey gaging-stations reflected two storms occurring within 24 hours. Measured precipitation indicated each storm event to be near a 100-year, 24-hour rainfall frequency. Peak discharges determined at selected locations in areas of greater rainfall depths exceeded those of the 100-year floods. (Woodard-USGS)

HYDROLOGY, FULTON COUNTY, NEW YORK,
Fulton County Planning Dept. Johnstown, NY.
H. W. Fear.
August 1972, Series No. 0872-FCPD-FC-HY, 37 p, 20 fig, 10 tab. NYP-246.

Descriptors: *Hydrologic cycle, *Precipitation cycle, *Mean daily discharge, *Water supply, *Water resources, *Hydrology, Aquifer, Water table, Groundwater, Streamflow, Topography, Snowmelt, Droughts, Runoff, *Fulton County(NY), Isopleth, Wind.

The purpose of this report is to cover that portion of Fulton County's water resources related to precipitation and its resultant runoff. Records of precipitations at 14 sites and of temperatures at 5 sites in Fulton County and adjacent areas have been selected for this comprehensive hydrologic study. The 8-year period of record is 1965-1972, selected as being representative of general hydrologic conditions in Fulton County. Amounts of precipitation recorded at each of the 14 selected sites have been tabulated for each of the 8 years and are presented in tables. To illustrate the runoff from snowmelt and spring rains, hydrographs of mean daily discharges at selected points for the months of least average precipitation and months of highest average precipitation are included. Other information included in the report is the lowest and highest temperatures during each year, wind movement in Fulton County and a discussion of evaporation. A companion volume on snow resources has also been prepared. (Coan-NC)
W79-00663

STREAMS AND DRAINAGE BASINS, FULTON COUNTY, NEW YORK,
Fulton County Planning Dept. Johnstown, NY.
H. W. Fear.
December 1970, Series No. 1270-FCPD-FC-DB, 40 p. NYP-223.

Descriptors: *Drainage area, *Flood area, *Runoff, *Stream flow, *River basins, *Water resources, Floods, Recreation, Reservoirs, Streams, *Fulton County(NY), *Mohawk River(NY), *Sacandaga River(NY), Hudson River(NY), Hydraulic data, Water impoundment.

Surface waters of Fulton County find their way to two major tributaries of the Hudson River: streams in the northeastern part, draining nearly 34% of the county, are in the Sacandaga River Basin; those in the western section, draining 66% of the county, flow into the Mohawk River Basin. The purpose of this report is to present data on the delination and size of streams in Fulton County which are contributors to the flow of the Sacadaga River and Great Sacandaga Lake and to the flow of the Mohawk River. Information is presented on the physical characteristics of Fulton County. Delineation of watersheds of Fulton County streams in the Mohawk River Basin was made using 18 U.S. Geological Survey (USGS) topographic maps. Streamflow records of runoff are presented in tables. Delineation of the watersheds of the Sacandaga River was made using 11 USGS topographic maps. Flood problems are discussed; possible flood areas are noted on maps and data are provided on probable high-water elevations. Water impoundments areas are noted for potential municipal water supplies and flood control; dam heights at certain points are calculated and their resultant reservoir sizes are estimated.
W79-00664

FLOOD PLAIN INFORMATION: OGDEN RIVER, OGDEN, UTAH.
Army Engineer District, Sacramento, CA.
Prepared for Weber Area Council of Governments, UT, June 1971, 22 p, 6 fig, 7 plates, 5 tab.

Descriptors: *Utah, *Flood profiles, *Flood data, *Peak discharge, Floods, Historic floods, Standard Project Flood, Flood protection, Non-structural alternatives, Land use, Planning, Zoning, Control structures, Reservoirs, Flood plains, Flood flow, Ogden(UT), *Ogden River(UT), Weber County(UT), Intermediate Regional Flood.

The study area involves the Ogden River and its flood plain in Weber County, Utah, including the City of Ogden. Land uses occupying the flood plain include agriculture, commercial, manufacturing, and residential development, recreation facilities, and transportation and communication installations. Flood data were obtained from topographic maps, field studies, historical sources, and discontinuous stream gage records. Flooding results from high intensity convective-type cloudburst storms. Such storms occur from mid-April through September, but occur most frequently in July and August. Measures utilized to reduce flood damage potential in the study area include two reservoirs, channel maintenance, watershed management, and fire protection in the uncontrolled tributary area. The worst recorded flood occurred in April, 1936, discharging 3,700 cubic feet per second (cfs). At the upstream study limit, the Intermediate Regional Flood would discharge 2,200 cfs, while the Standard Project Flood would discharge 3,400 cfs. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-00669

FLOOD PLAIN INFORMATION: BOX ELDER CREEK, BRIGHAM CITY, UTAH.
Army Engineer District, Sacramento, CA.
Prepared for Utah Division of Water Resources, Box Elder County, and Brigham City, UT, June 1975, 41 p, 12 fig, 9 plates, 6 tab.

Descriptors: *Utah, *Flooding, *Flood profiles, *Flood data, *Peak discharge, *Flood protection, Floods, Historic floods, Flood peak, Flow characteristics, Flood plains, Standard Project Flood, Non-structural alternatives, Building codes, Land use, Planning, Zoning, Control structures, Levee, Floodwalls, Dams, Channel improvement, Brigham City(UT), *Box Elder Creek(UT), Intermediate Regional Flood.

The study area includes Box Elder Creek and its flood plain in the vicinity of Brigham City, Utah. Sixty percent of the flood plain is devoted to non-intensive land uses, and the remainder is developed with residential, commercial, industrial, and transportation uses. Flood data were obtained from topographic maps, field studies, historical sources, and discontinuous stream gage records. Cloudburst storms may cause flooding at any time, but they most commonly occur in July and August. Snowmelt flooding does not constitute a serious hazard. The flood of February 1911 is believed to be the area's worst flood event. No streamflow records are available. The maximum recorded peak flow of 290 cubic feet per second (cfs) occurred on April 18, 1962. At the downstream study limit, the Intermediate Regional Flood would discharge 1,100 cfs while the Standard Project Flood would discharge 2,900 cfs. Both floods would crest at approximately 4,220 feet mean sea level. There are no existing or authorized flood control structures that would reduce flood damage in the study area. Structural and non-structural flood control measures are described. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-00670

FLOOD PLAIN INFORMATION: WOLF CREEK, LAWTON, OKLAHOMA.
Army Engineer District, Tulsa, OK.
Prepared for City of Lawton, OK, June 1972, 34 p, 9 fig, 33 plates, 5 tab.

Descriptors: *Oklahoma, *Flooding, *Flood profiles, *Flood data, *Peak discharge, *Non-structural alternatives, Floods, Historic floods, Flood plains, Standard Project Flood, Flood protection, Flood plain zoning, Flood plain insurance, Warning systems, Building codes, Land use, Planning, Lawton(OK), *Wolf Creek(OK), Intermediate Regional Flood.

The study area involves Wolf Creek and its flood plain in the vicinity of Lawton, in Comanche County, Oklahoma. Land use in the flood plain is residential and commercial. Flood data were obtained from topographic maps, historical sources, and field studies. No stream gage records exist. Intense storms of short duration produce most floods during the spring and fall. Eight major floods have occurred since 1936 with the worst flood occurring in May 1957. On the main branch of Wolf Creek, the Intermediate Regional Flood (IRF) would discharge 20,500 cubic feet per second (cfs), and would rise 5.6 feet, while the Standard Project Flood (SPF) would discharge 32,600 cfs and would rise 7.1 feet. No structural flood control measures capable of affecting major floods are anticipated. Non-structural measures have been instituted by the city and the county. Guidelines for flood plain management are presented. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-00671

FLOOD PLAIN INFORMATION: CHIKASKIA RIVER, BLACKWELL, OKLAHOMA.
Army Engineer District, Tulsa, OK.
Prepared for City of Blackwell, OK, June 1976, 26 p, 7 fig, 11 plates, 5 tab.

Descriptors: *Oklahoma, *Flooding, *Flood profiles, *Flood data, *Peak discharge, *Non-structural alternatives, Floods, Historic floods, Flow characteristics, Flood plains, Flood protection, Flood plain zoning, Flood plain insurance, Building codes, Land use, Planning, *Chikaskia

River(OK), Blackwell(OK), 100-year flood, 500-year flood.

The study area includes 8.4 channel miles of the Chikaskia River and its flood plain in the vicinity of Blackwell, Oklahoma. Developments in the flood plain consist of residential land uses on the river's east side and agricultural land uses on the west. Flood data were obtained from topographic maps, field studies, historical sources, and stream gage records. Storms may cause flooding at any time of year, but they occur most frequently in the spring and summer months. The region's larger floods result from intense local thunderstorms. The worst recorded flood occurred in June 1923, discharging 100,000 cubic feet per second (cfs) and cresting 12 feet above flood stage. Other significant floods occurred in 1942 and 1973, discharging 85,000 cfs and 63,500 cfs, respectively. The 100-year flood would discharge 159,000 cfs and would crest 20.3 feet above flood stage, while the 500-year flood would discharge 268,000 cfs and would crest 24.1 feet above flood stage. Four of the area's five bridges would be obstructive to the 100-year flood. Although no structural flood control measures exist, the city of Blackwell has instituted non-structural measures. Guidelines for flood plain management are presented. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-00672

FLOOD PLAIN INFORMATION: PROVO RIVER AND ROCK CANYON CREEK, PROVO-OREM, UTAH.
Army Engineer District, Sacramento, CA.
Prepared for Board of County Commissioners, Utah County, UT June 1971, 34 p, 8 fig, 8 plates, 7 tab.

Descriptors: *Utah, *Flood profiles, *Flood data, *Peak discharge, Floods, Streamflow forecasting, Historic floods, Flood stages, Flood plains, Standard project flood, Flood protection, Non-structural alternatives, Land use, Planning, Control structures, Levees, Reservoirs, *Provo River(UT), *Rock Canyon Creek(UT), *Provo(UT), *Orem(UT), Utahing County(UT), Intermediate Regional Flood.

The study area involves the flood plains of the Provo River and Rock Canyon Creek in the vicinity of Provo and Orem, Utah County, Utah. The flood plain is devoted primarily to agricultural and recreation uses, but some residential and commercial development is beginning to take place at the lower end of the study reach. Flood data were obtained from topographic maps, field studies, historical sources, and stream gage records. Flooding may result from snowmelt or high intensity, convective-type thunderstorms. Snowmelt flooding occurs from late April through early July, while rainfall flooding occurs from May through September. Existing flood control measures include a small reservoir, some low, discontinuous levees, watershed treatment measures, and fire protection in the Basin. Another reservoir is authorized, and non-structural measures are being considered. The worst recorded flood recorded at the Prove gage occurred on May 6, 1972, discharging 2,520 cubic feet per second (cfs). At the downstream study limit during the Intermediate Regional Flood (IRF), The Provo River and Rock Canyon Creek would discharge 3,000 and 2, 100 cfs, srespectively, and would crest at 4,607 and 4,631 feet mean sea level (msl), while the Standard Project Flood (SPF) would discharge 5,200 and 3,200 cfs respectively, and would crest at 4607.5 and 4632 feet msl. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-00673

FLOOD PLAIN INFORMATION: COODY CREEK, MUSKOGEE, OKLAHOMA.
Army Engineer District, Tulsa, OK.
Prepared for City of Muskogee, OK, February 1973, 27 p, 7 fig, 15 plates, 5 tab.

Descriptors: *Oklahoma, *Flooding, *Flood profiles, *Flood data, *Peak discharge, *Non-structural alternatives, *Floods, Flood flow, Historic floods, Flood stages, Flow characteristics, Flood plains, Standard project flood, Flood protection, Flood plain zoning, Flood plain insurance, Building codes, Land use, Planning, Muskogee(OK), *Coody Creek(OK), Intermediate Regional Flood.

The study area includes Coody Creek and its flood plain in the vicinity of Muskogee, Oklahoma. Development of the flood plain is not extensive, although increased development pressure is anticipated. Flood data were obtained from topographic maps, field studies and historical sources. No stream gage records were available. Most floods are caused by intense thunderstorms occurring from May through October. Severe floods occurred in 1957 and 1961. In the lower study reach, the Intermediate Regional Flood (IRF) would discharge 24,400 cubic feet per second (cfs) and would rise 40.7 feet, while the Standard Project Flood (SPF) would discharge 47,100 cfs and would rise 42.7 feet mean sea level (msl). No structural flood control measures are anticipated, and non-structural measures have not been enacted. Guidelines for flood plain management are presented. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-00674

FLOOD PLAIN INFORMATION: HAIKEY CREEK, TULSA COUNTY, OKLAHOMA.
Army Engineer District, Tulsa, OK.
Prepared for Tulsa Metropolitan Area Planning Commission, OK, September 1973, 27 p, 5 fig, 21 plates, 5 tab.

Descriptors: *Oklahoma, *Flooding, *Flood profiles, *Flood data, *Peak discharge, *Non-structural alternatives, Floods, Flood flow, Historic floods, Flow characteristics, Flood plains, Standards Project Flood, Flood protection, Flood plain zoning, Flood plain insurance, Building codes, Land use, Planning, *Haikey Creek(OK), Tulsa County(OK), Intermediate Regional Flood.

The study area includes Haikey Creek, its tributaries, and their flood plains in Tulsa County, Oklahoma. Intensive land use in the study area is limited, although development pressure from the cities of Tulsa and Bixby is anticipated. Flood data were obtained from topographic maps, historical sources, and field studies. No stream gage records are available. The worst known flood occurred in 1943. Other large floods occurred in 1970 and 1971. Intense rainfall most frequently causes flooding from May through October. On Haikey Creek, the Intermediate Regional Flood (IRF) would discharge 18,240 cubic feet per second (cfs) and would rise 3.6 feet, while the Standard Project Flood (SPF) would discharge 30,300 cfs and would rise 5.4 feet. Historical and future flood data are also presented for the major tributaries to Haikey Creek. Twenty-seven bridges in the study area would obstruct the IRF. There are no major flood control measures contemplated for the area. Guidelines for flood plain management are presented. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-00675

FLOOD PLAIN INFORMATION: PRYOR CREEK AND SALT BRANCH, PRYOR CREEK, OKLAHOMA.
Army Engineer District, Tulsa, OK.
Prepared for City of Pryor Creek, OK, May 1974, 36 p, 7 fig, 14 plates, 5 tab.

Descriptors: *Oklahoma, *Flooding, *Flood profiles, *Flood data, *Peak discharge, Floods, Flood flow, Historic floods, Flood stages, Flood plains, Flood protection, Standard Project Flood, Non-structural alternatives, Land use, Planning, Control structures, *Pryor Creek(OK), Salt Branch(OK), Mayes County(OK), Intermediate Regional Flood.

The study area includes Pryor Creek, Salt Branch, and their flood plains in the vicinity of Pryor Creek, Oklahoma. Land use in the flood plain is almost exclusively agricultural. Flood data were obtained from topographic maps, field studies, historical sources and stream gage records. Most flood-producing storms occur from April through September. The worst flood recorded on Pryor Creek occurred on October 3, 1959, discharging an estimated 32,000 cubic feet per second (cfs) and cresting at 601.18 feet mean sea level (msl). In the lower reach of the study area, the Intermediate Regional Flood would discharge 70,000 cfs and would crest 15.9 feet above flood stage, while the Standard Project Flood would discharge 106,000 cfs and would crest 20.3 feet above flood stage. Historical and projected flood data are also presented for Salt Branch. A flood damage prevention measure has been proposed for the Pryor Creek watershed. No plans have been developed for Salt Branch. The City of Pryor does not regulate use of the flood plain. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-00676

FLOOD PLAIN INFORMATION: STILLWATER CREEK AND TRIBUTARIES, STILLWATER, OKLAHOMA.
Army Engineer District, Tulsa, OK.
Prepared for City of Stillwater,OK, June 1968, 66 p, 15 fig, 30 plates, 17 tab.

Descriptors: *Oklahoma, *Flooding, *Flood profiles, *Flood data, *Flood peak, Floods, Historic floods, Flow duration, Flow characteristics, Stage-discharge relations, Rivers, Flood plains, Flood protection, Standard project flood, Non-structural alternatives, Land use, Planning, Control structures, Reservoirs, *Stillwater Creek(OK), Stillwater(OK), Cow Creek(OK), Duck Creek(OK), East and West Boomer Creeks(OK), East and West Brush Creeks(OK), Intermediate Regional Flood.

The study area includes Stillwater Creek, its tributaries, and their flood plains in the vicinity of Stillwater, Oklahoma. Within the city, the flood plain is extensively developed. Elsewhere, the flood plain is mostly agricultural. Flood data were obtained from topographic maps, field studies, and historical sources. Stream gage records exist for only three years. The worst recorded flood on Stillwater Creek occurred in October 1959, cresting at 856.7 feet mean sea level (msl) and discharging an estimated 51,000 cubic feet per second (cfs). At the same location, the Intermediate Regional Flood (IRF) would discharge 40,100 cfs and would crest at 856.0 feet msls, while the Standard project Flood (SPF) would discharge 77,600 cfs and would crest at 860.2 feet msl. All six of the bridges crossing the creek would be obstructive to the IRF. Descriptions of the Creek's major tributaries are presented--Cow Creek, Duck Creek, East and West Boomer Creeks, East and West Brush Creeks, as well as flood data for these tributaries. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-00677

ANCESTRAL NIAGARA RIVER DRAINAGE: STRATIGRAPHIC AND PALEONTOLOGIC SETTING,
State University of New York at Buffalo. Dept. of Geological Sciences.
P. E. Calkin, and C. E. Brett.
Geological Society of American Bulletin, Vol. 89, No. 8, p 1140-1154, August 1978. 6 fig, 3 tab, 51 ref.

Descriptors: *History, *Stratigraphy, *Rivers, Lakes, Geology, Basins, Watersheds(Basins), Mollusks, Ice, Carbon radioisotopes, *Paleontology, *Niagara River, Glacial oscillation, Glaciolascustrine deposits.

The modern Niagara River was initiated as a multi-outlet river-lake system following the last ice retreat from the area about 12,300 yr B.P. This system extended from Early Lake Erie to the contemporaneously formed Galcial Lake Iroquois in the Ontario basin. The last major ice advance and one subsequent glacial oscillation associated with the ice retreat are recorded in sequences of glaciolacustrine deposits and till along the present Gorge wall and within older bedrock spillways. Dated wood overlying Iroquois silts and till within the Lockport spillway, east of Niagara, suggest that the multi-outlet (Lake Tonawanda) phase of the drainage ceased about 10,900 yr B.P. with concentration of the outflow, and hence major gorge recession, at Lewiston. Radiocarbon analysis of mollusks from river gravels at the top of the Niagara Gorge at Whirlpool Park indicated that cataract recession from Lewiston to this site of intersection with the much older buried St. Davids Gorge occurred after 9800 yr B.P. Lake Tonawanda persisted near the present site of Niagara Falls until about 1,000 yr ago; however, dated mollusks imply that deposition here was interrupted by intense scouring shortly before 3800 yr B.P., which may have been response to the closing of the North Bay outlet of the upper Great Lakes and consequent large increase in discharge through Lake Erie. Mollusks which occur in the ancient Niagara River gravels are well preserved and distinctly zoned. The Lake Tonawanda fauna, heretofore undescribed, includes about 15 species, all of which are extant in the region. (Lee-ISWS)

EFFECT OF DEPTH ON DREDGING FREQUENCY; REPORT 1, SURVEY OF DISTRICT OFFICES,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
M. J. Trawle, and J. A. Boyd, Jr.
Technical Report H-78-5, May 1978 (Report 1 of a series). 39 p, 4 tab.

Descriptors: *Channel improvement, *Dredging, *Harbors.

Evaluates the effectiveness of advance maintenance dredging (overdepth dredging) in reducing dredging frequency and/or costs in the maintenance of coastal and inland channels and harbors, and establishes necessary guidelines for governing the practice. Defines the state of the art and presents the results of a survey of U.S. Army Engineer Corps district offices to determine the extent of the usage of advance maintenance dredging. Thirty-five Corps district offices and two division offices (no districts within the division) participated in the survey. The districts are classified as either coastal or inland. Coastal districts include a part of the coastline of the Atlantic or Pacific Ocean or the Gulf of Mexico. Inland districts do not include any of these coastalines within their boundaries. Results of the survey indicate that advance maintenance dredging is practiced on many projects in the coastal districts, particularly those along the southeast Atlantic and Gulf coasts, while it is sparingly practiced (beyond the current dredging season) in the inland districts. Advance maintenance dredging applicability is determined in most cases by previous experience with the practice and, to a lesser degree, by historical shoaling rates. (WES)

NUISANCE AQUATIC MACROPHYTE GROWTH,
Army Engineer District, Walla Walla, WA.
E. Hesser, and E. O. Gangstad.
Journal of Aquatic Plant Management, Vol. 16, p 11-13, June 1978. 1 fig, 2 tab., 7 ref. DACW 68-72-C-0269.

Descriptors: *Pacific Northwest U.S., *Aquatic weeds, *Macrophytes, *Columbia River, *Snake River, *Habitats, Land use, Washington, Oregon, Idaho, Montana, Watersheds(Basins), Altitude, Water temperature, Coasts, Surveys, Agricultural runoff, Pastures, Urban runoff, Elodea, Potamogeton, Chara, Ranuculus, Ceratophyllum, Myriophyllum, Nitella, Nuphar.

A survey of aquatic nuisance macrophytes at 723 sites in the Columbia and Snake River watersheds in Washington, Oregon, and Idaho (April-September 1973) showed 70% of specific problems were caused by eight genera: Elodea, Potamogeton, Chara, Ranuculus, Ceratophyllum, Myriophyllum, Nitella, and Nuphar. Sites, classified according to adjacent land use, water body type, altitude, water temperature, and nuisance growth, were subjected to matrix analysis. Nuisance weed growths were heaviest near population centers, near intensively grazed pastures, or in water bodies receiving irrigated agricultural runoff. Sites were selected on the basis of diversity of habitat and plant species, and of high standing crops of nuisance aquatic vegetation. Most taxa showed little apparent geographical or river basin zonation, and all problem taxa were very widespread. The presence or absence of a taxon in a specific river drainage depended on suitability of the habitat rather than being a function of prior introduction. Certain habitats were strongly related to heavy macrophyte growth: 60% of small ponds and 53.7% of small lakes had heavy growths, while only 30% of large lakes, 28.7% of rivers, and 11.4% of drawdown reservoirs had heavy growths. Drawdown pools and rivers generally were poor plant habitats. Aquatic weed problems were most common at lower altitudes and higher temperatures. Elodea, Nitella, and Nuphar had little or no correlation with land use or type of water body. (Lynch-Wisconsin)

ENVIRONMENTAL EFFECTS OF MECHANICAL HARVESTING,
Ontario Ministry of the Environment, Rexdale. Water Resources Branch.
I. Wile.
Journal of Aquatic Plant Management, Vol. 16, p 14-20, June 1978. 3 fig, 6 tab, 14 ref.

Descriptors: *Mechanical control, *Harvesting, *Chemung Lake(Ontario Canada), *Aquatic weed control, *Eurasian water milfoil, *Eutrophication, *Nutrient removal, Phosphorus, Myriophyllum spicatum, Myriophyllum exalbescens, Vallisneria americana, Macrophytes, Submerged plants, Phytoplankton, Algae, Nutrients, Lakes, Ontario(Canada), Canada, Runoff, Shallow water, Limiting factors, Fisheries, Recreation, Environmental effects.

Experimental harvesting of nuisance aquatic plants, particularly Eurasian water milfoil (Myriophyllum spicatum), was conducted 1973-75 in southern Chemung Lake, near Peterborough, Ontario, Canada, as an alternative to chemical treatment. In 1973, 1290 metric tons were removed from 266 ha, 2160 metric tons from 262 ha in 1974, and 3380 metric tons from 297 ha in 1975. M. spicatum, M. exalbescens, and Vallisneria americana dominated among submerged macrophytes, which covered some 430 ha (50%) of the surface of southern Chemung Lake. Although a marked growth of M. spicatum with concurrent reductions in M. exalbescens and Vallisneria throughout the lake system complicated evaluation of harvesting effects on plants, growth rates appeared lower in harvested areas. Peak annual biomass values were similar during the study period, ranging from 300-400 g dry wt/sq m. In 1975 harvested plants contained 560 kg phosphorus, equivalent to 47% of gross and 92% of net annual phosphorus loading to southern Chemung Lake. Significant reductions in phytoplankton biomass resulted from harvesting, from 2400-4700 in 1972 to 1750-2100 in 1976. Fish populations were unaffected by the harvesting. In experimental plots, multiple harvests effectively reduced stem densities of M. spicatum. Notably different results of harvesting at Lake Sallie, Minnesota are due to several environmental differences. (Lynch-Wisconsin)

AQUATIC WEED MANAGEMENT BY BENTHIC SEMI-BARRIERS,
State Univ. of New York Coll. at Fredonia. Environmental Resources Center.
R. J. Mayer.
Journal of Aquatic Plant Management, Vol. 16, p 31-33, June 1978. 1 tab, 14 ref.

Descriptors: *Aquatic weed control, *Methodology, *Screens, *Barriers, *Rooted aquatic plants, *Mechanical control, Myriophyllum exalbescens, Potamogeton crispus, Chautauqua Lake(NY), New York, Equipment, Semi-barriers, Fiberglass, Eutrophication, Lakes, Shallow water, Littoral, Benthos, Water management.

A control method for rooted aquatic weeds using a bottom covering of closely woven (62 apertures/sq cm) polyvinyl chloride-coated fiberglass screening resulted in 95% plant eradication in 2-3 weeks, and 95% long-term weed-free maintenance. No adverse ecological effects were detected, and fish,

attached algae, and benthic fauna (especially fish food organisms) were observed over or on the screens. Unlike impermeable polyethylene sheeting, the fiberglass mesh semi-barrier permits exchange of dissolved nutrients and gases between benthic communities and the overlying water column. The tests were conducted 1973-77 in Chautauqua Lake, New York, a shallow eutrophic lake producing intensive littoral weed communities each summer and fall dominated by American water milfoil (Myriophyllum exalbescens) in the northern basin and curly leaf pondweed (Potamogeton crispus) in the southern basin. Mesh sizes of 9.9, 39, and 62 apertures/sq cm were used. The 39-aperture mesh absorbs 49% of incident radiation, while 62-aperture screening absorbs 60%. Screens were affixed with bricks or T-bars. The 62-aperture mesh was most effective (85-95%), followed by 39-aperture (40-60%) and 9.9-aperture (20%). Regrowth with 62-aperture mesh was limited to dwarf plants, while the 39-aperture mesh was less effective in controlling long-term growth. Sedimentation on top of screens resulted in some regrowth; this could be eliminated by removing and repositioning the screens annually. (Lynch-Wisconsin)

TRADITIONAL LAND USE IN MARGINAL DRYLANDS,
United Nations Environment Programme, Nairobi (Kenya); and Secretariat for International Ecology (Sweden).
A. Hjort.
Ecological Bulletin (Stockholm), Vol. 24, p 43-53, 1976. 3 fig, 1 tab, 9 ref.

Descriptors: *Land use, *Nomads, *Marginal productivity, Agriculture, Dry farming, Migration, Land tenure, Land management, Rural sociology, Motivation, Pastoralism, Psychological aspects, Decision making, Kenya, Sudan.

Land use patterns of nomadic, semi nomadic and transhumat populations inhabiting marginal areas are analyzed here. Although this categorization is not always useful, it is helpful to analyze land use strategies of those living in marginal lands as they have been found to adopt practices that are defined by local limitations. A distinction between pastoralists and agricultural groups must be made as the focus of the social, economic and political organization of the two is basically different. Two land use strategies based upon local conditions are outlied to demostrate two typical kinds of economics. The Samburu nomads northwest ofMt. Kenya are analyzed to illustrate pastoralism and diversification, and the Nuer people of the southern Sudan are described to demonstrate hoe cultivation, transhumace and pastoralism. The recurrent point emerging from this analysis is that land use strategies in marginal areas are aimed at dispersing local resources so as to minimize risks. (Tickes-Arizona)

DESERT TRANSFORMATION IN CHINA.
Academia Sinica, Taipei (Taiwan). Dept. of Desert Research.
Scientia Sinica, Vol. 21, No. 2, p 251-278, March-April 1978. 18 tab, 3 ref.

Descriptors: *Deserts, *Dunes, *Shelterbelts, *Range management, *China, Sands, Grazing, Irrigation practices, Pasture management, Vegetation establishment, Water conservation, Land conservation, Biomes, Terrestrial habitats, Climatic zones, Forest management, Reservoir construction, Drainage systems, Land reclamation, Irrigation canals.

Desert areas in China are situate mainly in the northern parts of the country and cover and area of 1,095,000 Km2, accounting for 11.4% of the total land area. Various degrees of desertification adre found in the PRC due mainly to the numerous bioclimatic zones. Accordingly, several management approaches have been developed and applied to localized areas. For instance, shelterbelts of trees and grsses have been applied in sandstorm areas to anchor the sand and protect natural vegetation. pasture in themore humid stepe zones are carefully protected from overgrazing by nomadic animals, and desert areas with more abundent water and land resources have been chosen for construction of major engineering works such as reservoirs, canals and irrigation and drainage systems. Recent efforts include the most modern desert-adapted cultural practices and techniques. Previously barren and unusable land is now being used productively in China while further efforts in this direction continue at a raped pace. (Tiches-Arizona)

STREAMFLOW MODELING OF UPPER INDUS RIVER CATCHMENTS,
Asian Inst. of Tech., Bangkok (Thailand). Div. of Water Resources Engineering.
S. Selvalingam, and A. Masood.
Water Resources Bulletin, Vol. 14, No. 4, p 827-841, August, 1978. 11 fig, 6 ref.

Descriptors: *Streamflow, *Channel flow, *Model studies, Flow, Hydrographs, Simulation analysis, Rainfall-runoff relationships, Structural models, Analytical techniques, Theoretical analysis, Indus River, Pakistan, Snowmelt, *Alteration of flow, *Routing, Evaluation, Upstream, Downstream.

Streamflow in three tributaries of the upper Indus River catchment in Pakistan, The Siran, Haro, and Soan is simulated in this analysis using two models the Synthesis and Reservoir Regulation model (SSARR) developed by the U.S. Corp of Engineers and the Tank model designed by Sugawara (1961). These models are also used here for channel-routing of the main stream for a stretch of about eighty miles. The SSARR model, developed in 1972, allows for the synthesis of streamflow by evaluation of snowmelt and rainfall and consist of two basic components: (1) a generalized river basin model for synthesizing runoff from rainfall, and (2) a river systems model for routing stremflows from usptream to downstream points through channel and lake storage. The tank model used here consists of several tanks laid out in either a vertical or parallel series with outlets and at the bottoms and sides, depending upon whether the area of application is humid or non humid. Data for the 1964-1970 period was used to verify basin characteristics that were derived through trial and error. Results showed the SSARR model to be superior in simulating low flows while the two models were of equal accuracy in the handling of high flows. (Thickes-Arizona)

DESERT DEVELOPMENT IN THE V. I. LENIN KARAKUM CANAL ZONE,
Desert Inst., Ashkhadad (USSR).
A. Babaev, and Z. Freikin.
Social Sciences Today, Editorial Board, USSR Academy of Sciences, p 29-38, Moscow, 1977.

Descriptors: *Canal design, *Canal construction, *Conveyance structures, Water conservation, Channels, Water management, Arid lands, Deserts, Area redevelopment, Governmental interrelations, Political aspects, Agriculture, Economic justification, Social participation, Social impact, Community development, *USSR, *Karakum Canal.

The historical development of irrigation and land reclamation programand projects in the Soviet Union since 1918 are trced in an effort to illustrate that the scientific and technological revolution under developed socialism has facilitated the development of the deserts in the southern regions of the USSR. The planning, cinstruction and operation of one of these projects, the Karakum Canal, are discussed here in support ofthis thesis. First planned in 1906, this man-made canal now stretches for more than 1,000 Km. Bringing water from the Amudarya to virgin and old fallow land, the canal has made obsolate the once used shifting cultivation practices, facilitated livestock husbandry, and increased alfalfa sown land which replaces the previous noncultural farming based on cotton. Social, economic and political effects ofthe canal are discussed in this analysis to illstrate the strategies of the communist party and the Soviet government in managing the desert regions. Mining and recreational activities present a real and permanent danger to the biological productivity of arid regions throughout the world. Analized in this paper are the means by which these activities lead to desertification and alternative techniques to reverse these processes. Unlike other forms of land use, the initial effects of mining and recreation activities are localized and obvious, facilitating the developmet of plans to combat their environmental impact. Mining in Australia is an important economic activity, Accounting for 27% of her total exports. Major vegetation, access road construction and use, spoil dumps and human

activities associated with the mines. Techniques developed to manage affected areas are aimed at protection and stabilization of local ecosystems so that desertification is minimized. In arid Australia where tourism is popular, technicians have had to develop plans to reduce the pressure people are exerting upon local sites. These plans have included relocation of villages and roads, construction of viewing platforms, fences, and the reseeding of native but destroyed vegetation. The use of waste water in these rehabilitation efforts is of prime importance, both in the reduction of mine spoils and revegetation. Prompt planning and apropriate controls such as these have proven to be effective tools in reducing desertification processes caused by mining and recreational activities in Australia. THE EVOLUTION OF THE AUSTRALIAN DESERTS,
Sydney Univ. (Australia). Dept. of Geography.
T. L. Smith.
Arid Lands Newsletter, No 5, p 1-7, March 1977. 8 fig, 6 ref.

Descriptors: *Australia, *Playas, Lake basins, *Deserts, *Arid lands, *Geomorphology, Geologic history, Geologic formations, Geologic surveys.

Desertification, as it has affected one-third of the Australian continent, is discussed here not in terms of land management but rather in terms of natural history and environment. It is this author's belief that much of the desert encroachment in Australia could have been avoided with a better understanding of the Landforms present and their evolution; accordingly, a brief natural history of Australian desert landforms is presented followed by a discussion of the four principal types of deserts: the mountain deserts, shield deserts, stony deserts and sand deserts. Playas by the thousands dot the arid landscapes of Australia, usually dry, but occasionally full from unusual rains. Geologic evidence reveals that they were once larger and filled with permanent water. Having outlined and explained the distinctive features of each principal desert type, this author provides a brief geologic history of these formations from the late Jurassic period (ca. 150 to ca. 136 million years B.P.) to present. STRATEGY FOR THE DEVELOPMENT AND MANAGEMENT OF DESERTS.
Science and Public Policy, Vol. J, No. 1, p 56-62, Feb. 1978.

Descriptors: *Arid lands, *Deserts, *Land management, *Water resources development, Water management(Applied), Range management, Water conservation, Climatology, Social values, Technology transfer, Political aspects, Institutions, Planning.

Reported here are the recomendations of the Sacramento conference on alternative strategies for desert development and management (1977). Basic factors leading to desertification are defined as: (1) population growth resulting in increased flock size ad overgrazing, (2) destructive land and water management, (3) climatic variation as well as long-term change, and (4) social, politcal and cultural factors. Examples of desertification processes and technologies for improvement are presented from both developed and developing contries with emphasis placed upon the need to adapt existing technology to local conditions. Under the heading of water management specifically, recognition of the fact that institutional and political solutions as well as technological answeres must be sought was paramount. Long range planning for the beneficial use of fossil groundewater, techniques to maximize effective use of available water through improved irrigation techniques, evaporation control, salinity control ad drainage, ad water harvesting to maximize rainfall use, were discussed. WATER LEVEL MEASUREMENT DEVICE,
C. B. Shuler, and W. E. Moore, Jr.
U.S. Patent No. 4,090,407, 4 p, 3 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 970, No 4, p 1239, May 23, 1978.

Descriptors: *Patents, *Water levels, *Measurement, Ultrasonics, Sound waves, Instrumentation, Electronic equipment.

The invention utilizes a technique of water level measurement including electronic and ultrasonic means. The device solves the problem of variable speed of sound by use of a fixed insert within a hollow, oblong structure which provides a standard by which comparison techniques may determine the accurate level of the water. The device comprises a hollow, oblong structure with an open end. The structure is secured with the open end in the water. A signal sending and receiving means is secured onto the hollow, oblong structure. An insert containing a hole is secured within the structure. The insert is operative to reflect a signal from the sending and receiving means back to the sending and receiving means through the structure. Portions of the signal pass through the hole in the insert without being reflected and proceed to be reflected by the water in the open end of the structure. Electronic means are connected to the signal sending and receiving means. The electronic means are operative to determine and compare the length of time the signal is sent and returned from the insert and from the water. From the comparison of the length of time the signal returned from the insert and from the water, the level of the water may be determined. (Sinha-OEIS)

Working Paper No. 7, 15 p; Working Paper No. 8, 17 p; Working Paper No. 9, 28 p; Working Paper No. 10, 15 p. (California Water Resources Center Project UCAL-WRC-W-495). OWRT B-175-CAL(1).

Descriptors: *Water shortage, *Water supply, *Potential water supply, *Rationing(Water), Water management(Applied), California, Municipal water, Water distribution(Applied), Water allocation(Policy), *San Diego(Calif).

Communities which must rely on single sources of water are very vulnerable to disruptions of their sources. Many such communities are found in Southern California where long aqueducts, never too far from earthquake faults, constitute the main link to remote rivers and dams. The many considerations which arise indicate the need to prepare emergency plans before a disaster strikes. Working Paper No. 7 states the emergency problems and describes the development of an emergency plan for a particular agency. Working Paper No. 8 discusses alternative measures for allocation of water in an emergency. Rapid restoration of water service in a system which has incurred physical damage requires effective allocation of available personnel, equipment, and supplies to the needed repairs. Priorities among the repairs may vary from user criticality to the most efficient utilization of equipment. Working Paper No. 9 discusses different allocation policies from which may be selected the appropriate set which will match the pattern of disruption. Working Paper No. 10 discusses common causes of failure in organized response to disaster and presents preparedness activities designed to reduce the potential for failures in the emergency response system. Descriptors: *Water shortage, *Water supply, *Potential water supply, *Rationing(Water), Water management(Applied), California, Water allocation(Policy), *Water distribution(Applied), *San Diego(Calif), Poway Municipal Water Dist(Calif).

This manual provides guidelines to be used by the staff of the Poway Municipal Water District during

maor water service emergencies. It addresses problems which occur when service to a large portion of users is interrupted to the extent that the health and welfare of the community may be affected. Allocation of the available wate, restoration of service, and liaison with the community or with other agencies are but some of the tasks faced by District personnel during such an emergency. The purpose of this manual is partly to serve as a checklist or handbook of reference during periods of crisis, and partly to suggest measures and exercises in preparation for emergencies. Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 522, Price codes: A04 in paper copy, A01 in microfiche. Emergency Water Allocation Project, School of Engineering, Univ. of Caif., Irvine, Working Paper No. 6, July 1976. 60 p. (Calif. Water Resources Center Project UCAL-WRC-W-498). OWRT-B-178-CAL(6).

Descriptors: *Water shortage, Water resources, *Planning, *Attitudes, *Phychological aspects, Decision making, Social aspects, New Jersey, *Trenton(NJ).

This report on the water shortage which occurred in and around Trenton, New Jersey, in September 1975 is based on personal observations, newspaper stories, and official documents. A chronological account conveys the atmosphere of an emergency in which acts of generous assistance occur in the midst of confusion that inevitably accompanies any crisis involving a multitude of agencies. The reactions of the authorities, the public, and the press are probed in a brief analysis of events leading up to and following the failure of the pumps at the filtration plant. FEDERAL RESERVATION OF GEOTHERMAL RESOURCES,
R. M. Silver.
Natural Resources Journal, Vol. 18, No. 1, p 213-16, January, 1978.

Descriptors: *Geothermal studies, *Reservation doctrine, *Public lands, *Judicial decisions, Federal government, United States, Legislation, Steam, California, Legal aspects, Energy.

There have been recent developments in the area of federal reservation of geothermal resources. In 1977, the Ninth Circuit Court of Appeals held that geothermal resources are included in mineral reservations to the United States under the Stock-Raising Homestead Act (Act). Consequently, they are not subject to development by the owner of the surface estate. This case comment on United States v. Union Oil Company explores the court's reasoning in reaching its holding. The case arose when Union Oil sought to develop wells on land owned under the Act in order to produce geothermal steam for generating electricity. The Act grants surface ownership to private individuals while reserving mineral interests in the United States. In order to determine the extent of the reservation, the court examined the legislative history of the Act to reach its interpretation of the Act. The intent of the Act is to retain sources of energy for the government. This case significantly widens the definition of 'mineral interst.' The implications of the case could be great because geothermal resources may be in great demand for future energy needs. The Ninth Circuit decision is being appealed to the Supreme Court. TOWARD A RATIONAL DEVELOPMENT OF ARTIFICIAL-RECHARGE RESEARCH,
Geological Survey, Lubbock, TX. Water Resources Div.
W. W. Wood.
In: Advances in Groundwater Hydrology: American Water Resources Associations, p 243-247, September 1976.

Descriptors: *Artificial recharge, *Groundwater recharge, *Water management(Applied), *Aquifer characteristics, *Water quality, Recharge wells, Injection wells, Chemical properties, Biochemical properties, Water chemistry, Water transfer.

Artificial recharge can be an effective water-management technique if the hydrogeologic conditions of the aquifer system are quantified and if rational design criteria are established. The successful application of artificial recharge depends upon the development of methods for evaluating the changes in aquifer characteristics in both the saturated and unsaturated zones as a function of chemical, biological, and physical changes associated with the introduction of foreign water into the subsurface environment. Also, additional methods need to be developed to predict resulting variations of water quality in time and space. (Woodard-USGS)

THE USE OF BENTHIC MACROINVERTEBRATES AS INDICATORS OF LOGGING IMPACT ON STREAMS WITH AN EVALUATION OF BUFFER STRIP EFFECTIVENESS,
California Univ., Berkeley. Dept. of Forestry and Conservation.
J. D. Newbold.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 434, Price codes: A06 in paper copy, A01 in microfiche. PhD Thesis, February 1977. 103 p, 81 ref, 5 append. (Water Resources Center Project UCAL-WRC-W-411) OWRT A-047-CAL(2).

Descriptors: *Benthic fauna, *Microorganisms, *Lumbering, Forest management, Invertebrates, Indicators, *Buffer strips, Streams, *California, Watersheds(Basins), Watershed management, Pri-

mary productivity, Clear-cutting, Sampling, Pollutant identification.

Benthic samples were taken from 83 stations in 55 streams in mountains of northern California between May and September 1975. Stations were in logged and unlogged watersheds, and above, in, and below reaches disturbed by logged road crossings. Nine streams in logged watersheds were not protected by buffer strips, while 14 had buffers from 3 to 60 m wide. There were both clear-cuts and selective logging, all at least one year old. Circumstantial evidence suggests that higher primary productivities in the logged streams are mainly responsible for the changes in benthic populations, but that scouring by logging debris during winter floods may also be important. (Snyder-Calif Davis)

COMPUTER ANALYSIS OF THE WATER BUDGET OF THE PROPOSED OAK OPENINGS NEW TOWN, LUCAS COUNTY, OHIO,
Toledo Univ., OH.
M. B. McAvey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 417, Price codes: A07 in paper copy, A01 in microfiche. Master's Thesis in Geology and Hydrogeology, March 1978. 133 p, 23 fig, 4 tab, 40 ref, 2 append. OWRT C-3082 (No 3682)(7).

Descriptors: *Hydrologic budget, *Water balance, Hydrology, *Computer models, Mapping, Discharge(Water), Land use, Drainage, Groundwater, Evapotranspiration, Evaporation, Runoff, Precipitation, Inflow, Dew point, Meteorology, Equations, Computer programs, Urbanization, Soil moisture, Water table, Surface-groundwater relationships, Surface discharge, Soil water movement, City planning, *Ohio.

The water budget for a proposed site of a new town near Toledo, Ohio, was calculated with the help of a computer assisted data analysis. Daily values of surface to groundwater outflows and groundwater storage were snythesized. Groundwater storage and material calculations were done using computer-drawn water table maps but with little success because of the large number of grid cells and relatively small number of observation points. A modified Weather Bureau equation using wind speed, temperature, dew point, and insolation data yielded estimates of daily lake evaporation and a preliminary estimate of evapotranspiration. The resulting annual total was 116% of precipitation. Seasonal adjustment factors which averaged 0.5 and reflected water availability were used to produce a balanced budget. A major component of the budget was atmospheric exchange which accounted for 59% of the output and all of the input. The only other significant term is surface outflow which is limited because of its controlling mechanism. Other factors are evapotranspiration and surface discharge resulting from groundwater flow to man-made drainage ditches. It is concluded that the area is poorly suited to urbanization and other extensive use because of the high risk of groundwater flooding in the spring and the need for large volumes of imported water in the fall. These problems result from the limited storage capacity of the reservoir, high soil conductivity, inadequate surface drainage, and high rate of evapotranspiration. (Majtenyi-IPA)

PHYSICAL AND ECONOMIC ASPECTS ASSOCIATED WITH RUNOFF FROM URBAN GROWTH IN THE RALSTON CREEK WATERSHEDS,
Iowa Univ., Iowa City.
J. R. Barnard, and T. E. Croley, II.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 390, Price codes: A04 in paper copy, A01 in microfiche. Final Report, September 1977. 55 p, 15 fig, 13 tab, 55 ref. OWRT A-053-IA(4) and OWRT B-0550IA(1).

Descriptors: *Model studies, *Watersheds(Basins), *Urban runoff, Iowa City, Flood forecasting, Data collection, Mathematical models, Water policy, Water management, Economic impact, Flood damage, Flood data, Flood frequency, Hydrologic models, Urbanization, Projections, Social aspects, Cost analysis, *Ralston Creek Watershed(Iowa).

The impact of urban expansion on the hydrology of the small Ralston Creek watershed area in Iowa City, Iowa, was evauated using modeling techniques requiring extensive precipitation and runoff records. A very effective hourly precipitation data generation model was constructed and the IIHR Stanford Watershed model was calibrated for pre-urban and present conditions to estimate surfacial flows and alternative future develoopment. From the hydrologic model, backwater profiles and stage-discharge relations for selected points on the creek were translated into probability of flooding estimates. Evidence shows that as urban expansion spreads to upper portions of the watershed, the problem of flooding downstream increases. The effects of increased flood hazard on property values were examined and a survey of 61 households in the Ralston Creek was conducted. Aggregate social costs associated with urban expansion and flood hazard are estimated and policy implications are discussed. Primary questions to be answered are: (1) how can urban expansion proceed without increasing flood hazard; (2) what should be done about existing flood problems. (Majtenyi-IPA)

KOLYMA WATER BALANCE STATION, MAGADAN OBLAST, NORTHEAST U.S.S.R.: UNITED STATES-SOVIET SCIENTIFIC EXCHANGE VISIT,
Forest Service (USDA), College, AK. Inst. of Northern Forestry.
C. W. Slaughter, and M. A. Bilello.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 616, Price codes: A02 in paper copy, A01 in microfiche. Special Report 77-15, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, May 1977. 71 p, 30 fig, 5 ref, 6 append.

Descriptors: Foreign research, *Alaska, *United States, *Research facilities, *Information exchange, *Hydrology, Water balance, Rivers, Watersheds(Basins), Permafrost, Snowpacks, Snow, Cold regions, Geological regions, Instrumentation, Equipment, Stream gages, Groundwater, Soil water, Precipitation(Atmospheric), *Exchange visits, *USSR, *Magadan Oblast(USSR), *Kolyma Water Balance Station(USSR).

Two US scientists visited Kolyma Water Balance Station (KWBS) in Magadan Oblast of northeast USSR during the last two weeks of August 1976. Under the auspices of the Joint US - USSR Agreement on Cooperation in the Field of Environmental Protection, this trip was undertaken to review current Soviet watershed hydrology research in a permafrost-dominated setting similar to that of central Alaska. Research objectives, instrumentation, and field practices were observed and discussed at KWBS. A series of proposals for future cooperation in high-latitude hydrology research and data exchange was prepared. (Sims-ISWS)

MANUAL FOR METHODS OF QUICKLY VEGETATING SOILS OF LOW PRODUCTIVITY, CONSTRUCTION ACTIVITIES,
Midwest Research Inst. Kansas City, MO.
F. W. Bennett, and R. L. Donahue.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-253 329, Price codes: A21 in paper copy, A01 in microfiche. Final Report, June 5, 1975. 484 p, 79 fig, 35 tab, 105 ref. EPA 68-01-2632.

Descriptors: *Sediment control, *Vegetation establishment, *Water pollution control, *Construction, Vegetation, Fertilization, Soils, Mulching, Runoff, Erosion, Water pollution, Environment, Erosion contol, Bank erosion, Rill erosion, Sheet erosion, Soil erosion, Soil management, Construction pollution control.

The study has produced a user's manual for the 50 states on latest methods and procedures for establishing dense stands of perennial vegetation on soils of low productivity that have been disturbed by construction activities, will hold the soil in place, and thus will minimize water pollution by sedimentation. The manual defined common ground, in a practical and applied way, among many technical disciplines. The sciences of soil, geologic material, and plant growth were defined and related. Emphasis of the manual was on vegetating soils that are naturally low in productivity. Soil Great Groups that fit this criteria representing 39% of the United States land area were discussed. The soil and plant research of many professional scientists was related and brought into focus. Demonstration sites at 10 locations were characterized and documented. (Sims-ISWS)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

COLORIMETRIC ANALYSIS OF AMMONIA IN WATER,
American Univ., Washington, DC. Dept. of Chemistry.
F. W. Carson, and R. L. Gross.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 301, Price codes: A02 in paper copy, A01 in microfiche. Washington Technical Institute Water Resources Research Center Report No. 11, February 1977. 8 p, 21 fig, 13 ref. OWRT A-003-DC(1).

Descriptors: *Ammonia, *Analytical techniques, *Colorimetry, *Chemical analysis, Chemical reactions, Analysis, Pollutants, Aqueous solutions, Water chemistry, Organic compounds, Measurement, Testing procedures, Automation.

An accurate, reliable method of determining concentration of ammonia in water solution was developed using colorimetric techniques. The procedure involves formation of a colored complex of ammonia with 2,5-dimethoxyoxolane and (E)-p-dimethylamino-cinnamaldehyde. This intensely blue complex has an alpha sub max of 630 nm and an extinction coefficient of 45,200 at a concentration of approximately 2 x 10(-5)M. The color forms in about 6 minutes and has a half-life of 7.8 hours. The procedure takes only about 3 minutes per analysis for multiple samples and involves a standard error of only 3%. Also, the method is suitable for automation. The lower limit of ammonia concentration is 10(-4)M but this could be reduced to 10(-6)M by increasing cell path to 10 cm and by using a spectrophotometer with an expanded scale of 0-0.1 absorbance units. (Majtenyi-IPA)

BIOLOGICAL CONTROL OF BLUE-GREEN ALGAE,
Nebraska Univ., Lincoln. School of Life Sciences.
E. L. Martin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 311, Price codes: A03 in paper copy, A01 in microfiche. Nebraska Water Resources Research Institute Technical Completion Report, June 1976. 16 p, 11 fig, 7 tab. OWRT A-033-NEB(1).

Descriptors: *Cyanophyta, *Algal control, *Aquatic algae, *Lakes, *Algicides, *Eutrophication, Control, Water resources, Biological control, Recreation, Viruses, Plant viruses, Biocontrol, Microbiology, Nebraska, Scenery.

Three forms of blue-green algae, which detract from beauty and recreational value and accelerate eutrophication of many flood-control lakes in eastern Nebraska, have been isolated. Two filamentous forms, Aphanizomenon and Anabaena, and a unicellular Microcystis have been isolated in confluent, unialgal cultures; Microcystis has been isolated also in axenic culture. A search for naturally-occurring viruses and bacteria capable of selectively attacking these bloom-causing strains of algae has yielded several candidates. Two possible bacterial control agents were found and isolated in pure form. One was identified as a species from the genus Alcaligenes, and the other as a member of the Actinomycetes group. Studies on the mechanism of lysis indicate that the Actinomycetes appear to be able to express its lytic activity via an extracellular chemical but the Alcaligenes requires cell-to-cell contact with blue-green algal cells. A possible viral control agent has been isolated also and appears to be a new virus which was well characterized. This virus is specifically lytic to strains of Microcystis and Synechococcus. A second viral control agent was recently isolated but has not yet been well characterized. (Majtenyi-IPA)

A 'Standard Reference Water Sample' study of the U.S. Geological Survey Water Resources Division has been conducted for over 14 years with more than 40 participating laboratories throughout the world. Means of concentration values and their standard deviations are calculated to evaluate the precision of the participating laboratories as a group. When the values for quality control data generated by the laboratories system during the last 3 years were compared to the Standard Reference Water Sample data, only 11 percent of the results exceeded 1.5 standard deviations from the accepted values compared to an expected 14 percent. During 1976, 9.2 percent of the values fell outside 1.5 standard deviations. (Woodard-USGS)

ANALYSES OF AROMATIC HYDROCARBONS IN INTERTIDAL SEDIMENTS RESULTING FROM TWO SPILLS OF NO. 2 FUEL OIL IN BUZZARDS BAY, MASSACHUSETTS,
Woods Hole Oceanographic Institution, MA. Dept. of Biology; and Woods Hole Oceanographic Institution, MA. Dept. of Chemistry.
J. M. Teal, K. Burns, and J. Farrington.
Journal of the Fisheries Research Board of Canada, Vol 35, No. 5, p 510-520, May 1978. 6 fig, 4 tab, 33 ref. From: Proceedins of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Sediments, *Intertidal areas, *Oil pollution, *Weathering, Aromatic compounds, Water pollution effects, Ecosystems, Oil spills, Massachusetts, *Outer Continental Shelf, Hydrocarbons, *Buzzards Bay(Mass).

The two- and three-ring aromatic hydrocarbons were analyzed from the Wild Harbor oil spill in September 1969 and the Winsor Cove oil spill in October 1974, in intertidal marsh sediments, using glass capillary gas-chromatographic and mass-fragmentographic analyses. Naphthalenes with 0-3 alkyl substitutions and phenanthrenes with 0-2 substitutions decreased in concentration with time in surface sediments. The more substituted aromatics decreased relatively less and in some cases actually increased in absolute concentration. The changes in composition of the aromatic fraction have potential consequences for the ecosystem and provide insight into geochemical processes of oil weathering. (Sinha-OEIS)

RESIDUES OF BUNKER C OIL IN CHEDABUCTO BAY, NOVA SCOTIA, 6 YEARS AFTER THE ARROW SPILL,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Marine Ecology Lab.
P. D. Keizer, T. P. Ahern, J. Dale, and J. H. Vandermeulen.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 528-535, May 1978. 7 fig, 1 tab, 21 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil spills, *Sediments, *Intertidal areas, Oil pollution, Environmental effects, Water pollution effects, *Outer Continental Shelf, Nova Scotia, Petroleum hydrocarbons, Aromatic hydrocarbons, Bunker C oil.

The Arrow spill in February 1970 heavily oiled approximately one half of the 600 km shoreline of Chedabucto Bay, Nova Scotia. An extensive field survey and chemical analysis of sediment samples for aliphatic and polycyclic aromatic hydrocarbons identified only a few locations where Arrow Bunker C remained in the intertidal and sublittoral sediments. The upper intertidal zones of Rabbit, Crichton, and Durell Islands remain covered with an oil and sediment mixture of a 'pavement-like' consistency. Several areas showed visual and chemical evidence of recent spills during the survey period. All sublittoral sediment samples contained hydrocarbons of petroleum origin. The distribution of the most highly contaminated sublittoral sediments suggests either reentry of stranded oil into the water column and into the sublittoral sediments or contamination from shipping and fishing vessels. Concentrations in the sublittoral sediments are below those found toxic to benthic organisms. An estimation of the amount of Bunker C remaining in Chedabucto Bay is impossible due to the patchy distribution, contributions of more recent spills, and the absence of adequate control sites. CONTRIBUTION OF CHRONIC PETROLEUM INPUTS TO NARRAGANSETT BAY AND RHODE ISLAND SOUND SEDIMENTS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
E. S. Van Vleet, and J. G. Quinn.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 536-543, May 1978. 2 fig, 3 tab, 29 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Water pollution effects, *Sediments, *Oil pollution, Rhode Island, Environmental effects, *Outer Continental Shelf, Petroleum hydrocarbons, Biogenic hydrocarbons, Gulf of Maine.

Sediment cores from Narragansett Bay and Rhode Island Sound have been analyzed for petroleum hydrocarbons and compared with a relatively unpolluted sediment core from the Gulf of Maine. The sediments were analyzed for unbound hydrocarbons, hydrocarbons bound or closely associated with humic substances, and residual hydrocarbons bound or closely associated with the clay mineral or kerogen matrix. Results indicated that in general 90-100% of the hydrocarbons were in the unbound form and could be easily extracted with organic solvents. The petroleum hydrocarbons decreased with depth at all stations. Biogenic hydrocarbons made up an increasingly greater percentage of the total with increasing depth. The hydrocarbons in the Narragansett Bay sediments and near surface Rhode Island Sound sediments strongly resembled the hydrocarbons previously reported for the Providence River and upper Narragansett Bay. These petroleum-like hydrocarbons were shown to be largely introduced to the river and bay through chronic inputs from a municipal wastewater treatment plant. These hydrocarbons then undergo sedimentation throughout the entire bay and into Rhode Island Sound. Preliminary calculations indicate that over 0.2 million ton of petroleum hydrocarbons may be transported to the marine environment annually from municipal treatment plants. Most of these hydrocarbons appear to accumulate in estuarine and coastal sediments. (Sinha-OEIS)

SALMONELLOSIS IN MAN AND ANIMALS AS AN ENVIRONMENTAL HEALTH PROBLEM,
Purdue Univ., Lafayette, IN. Inst. of Environmental Health.
E. V. Morse, E. P. Myhrom, and D. E. Greenwood.
Journal Environment, Science and Health, A11(12), p 755-769, 1976, 1 tab, 67 ref. OWRT B-076-IND(2).

Descriptors: *Salmonella, *Water quality, Sewage bacteria, Water pollution, Water pollution sources, Public health, Human diseases, *Salmonellosis, *Food poisoning.

The Salmonella genus comprises over 1700 serotypes of pathogenic enteric bacteria. These microorganisms colonize in the intestinal tracts and mesenteric lymph nodes of man and lower vertebrates. Intra- and intergenus transfer of the infection(s) is cmmon. The disease in man and animals has not decreased during the last decade. Fecal contamination, by either symptomatic or occult carriers and shedders, is the primary transmission source of salmonellosis. The salmonellae problem and its possible resolution are intimately associated with the environment: waste disposal, including water and land use; food and feed processing, transportation and storage; livestock, poultry and dairy production; free-living and captive wildlife hosts as infection reservoirs; household pets and companion animals; various stress factors affecting man and food-producing animals; wholesale and retail marketing of fresh and frozen foods, and ultimately the consumer, including restaurants, involved in handling, preparation and storage of foods destined for the dinner table. Salmonellosis cannot be eradicated in the U.S. due to the environmental complexities of the problem. We can only hope for better preventive and control measures through greater effort in research, surveillance and education as well as awareness of the national problem.

SALMONELLA AS MONITORS OF FECAL POLLUTION IN THE AQUATIC ENVIRONMENT,
Purdue Univ., Lafayette, IN. Inst. of Environmental Health.
E. V. Morse, and M. A. Duncan.
Journal of Environment, Science and Health, A11 (10 and 11) p 591-601, 1976, 3 tab, 15 ref. OWRT-B-076-IND(1).

Descriptors: *Salmonella, *Sewage bacteria, *Water quality, Enteric bacteria, Water pollution, Mussels, Fish, Sediments, *Pollutant identification, Fecal pollution.

Polluted river water, river bottom sediment, fish body slime, fish gastrointestinal tracts and fresh water mussel gastrointestinal tracts were examined for Salmonella. Eleven serotypes were found among 131 isolates. S. amsterdam was the predominating Salmonella spp., and was obtained from all specimens. Two serotypes, give and senftenberg, were found only in the fish gastrointestional tracts. Salmonella may colonize in fish and serve as an indicator system for current as well as retrospective evidence of fecal pollution of the aquatic environment.

TRACE ELEMENT STUDY AT A PRIMARY COPPER SMELTER, VOLUME 1,
Radian Corp., Austin, TX.
K. Schwitzgebel, R. T. Coleman, R. V. Collins, R. M. Mann, and C. M. Thompson.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-285 935, Price codes: A05 in paper copy, A01 in microfiche. Report No EPA-600/2-78-065a, March 1978. 61 p, 15 fig, 21 tab. 68-01-4136.

Descriptors: *Air pollution, *Trace elements, *Toxicity, *Inustrial wastes, *Arsenic, *Electrostatic precipitation, Sampling, Evaluation, Molybdenum, Design standards, *Pollutant identification, Arsenic trioxide, Copper smelting.

A sampling study was carried out at a copper smelter, with a production rate of 200 tons of copper a day, with special emphasis on the performance of the electrostatic precipitator in collecting particulate matter escaping from the reverberatory furnace. Element balance of the reverberatory furnace showed that nearly all molybdenum is trapped in the slag; however, only 1/4 of the 190 lb/hr of arsenic entering the furnace is discharged with slag. About 1/4 of total arsenic is transported with the matte to the converters and about 1/2 leaves the furnace with the flue gas. Studies on the electrostatic precipitator led to the conclusion that particulate emissions are controlled with 96% efficiency at the 600 F operating temperature as specified in the design; however, appreciable amounts of toxic trace elements pass through the precipitator in the vapor state and condense to form particulate upon cooling. Arsenic trioxide was a major constituent of such vapor state emissions. (See also W79-00880) (Majtenyi-IPA)

TRACE ELEMENT STUDY AT A PRIMARY COPPER SMELTER, VOLUME 2, REPORT APPENDIX,
Radian Corp., Austin, TX.
K. Schwitzgebel, R. T. Coleman, R. V. Collins, R. M. Mann, and C. M. Thompson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 991, Price codes: A07 in paper copy, A01 in microfiche. Report No EPA-600/2-78-065b, March 1978. 131 p, 26 fig, 34 tab, 20 ref. 68-01-4136.

Descriptors: *Air pollution, *Trace elements, *Sampling, Analysis, *Industrial wastes, *Pollutant identification, X-ray fluorescence, Mass spectrometry, Arsenic, X-ray diffraction, Cadmium, Molybdenum, Lead, Antimony, Selenium, Zinc, Fluorine, Electrostatic precipitation, Copper smelting, Chemical analysis, Path of pollutants.

The details concerning sampling, sample analysis, and data evaluation are presented for a study made of trace element emissions of a primary copper smelter. During the evaluation of the electrostatic precipitor, the primary goal of the study, the parameters measured were: gas flow rate, gas composition, grain loading at inlet and outlet, particle size distribution, electrical performance, trace element material balance and flow rates as vapor, the amount of material condensible between gas temperature of 600 F and EPA recommended cool-off point of 250 F, and arsenic emission rates. Analytical procedures used to identify and quantify trace element emissions included x-ray fluorescence and spark source mass spectrometry. Results are tabulated for reverberatory furnace feed, impinger condensates, furnace slag, and incoming and outgoing electrostatic precipitator streams. Elements investigated include: arsenic, cadmium, molybdenum, lead, antimony, selenium, zinc, and fluorine. (See also W79-00879) (Majtenyi-IPA)

A REPORT ON THE USE OF THE MACRORETICULAR RESIN XAD-2 TO ISOLATE PESTICIDES FROM THE CAPE FEAR RIVER,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
W. Harden.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 564, Price codes: A05 in paper copy, A01 in microfiche. Ms Thesis, 1977. 90 p. 17 fig, 25 tab. OWRT A-073-NC(3), 14-31-0001-5033.

Descriptors: *Pesticides, *Macroreticular resins, *Resins, *North Carolina, *Cape Fear River(NC), Isolation, *Pollutant identification, *Monitoring, Water quality, *Pesticide residues.

A procedure for the monitoring of pesticides in natural waters was developed and utilized in a survey of the Cape Fear River Basin of North Carolina. Pesticides were adsorbed from aqueous solution onto the macroreticular resin XAD-2 and subsequently eluted with diethyl ether. The eluate was concentrated and then analyzed by electron capture gas chromatography. Reproducible, though rather low, recovery efficiencies were obtained by this method. Concentrations in the ng/l range were found in Cape Fear River samples for several pesticides. Trifluralin, DDT, and DDE were identified in most samples. The concentrations of DDT and DDE exceeded recommended limits in Water Quality Criteria 1972 for protection of aquatic life. (Kiger-North Carolina)

Static and flow-through fish toxicity tests were conducted on four chlorinated solvents: perchloroethylene, trichloroethylene, 1,1,1-trichloroethane, and methylene chloride to demonstrate the significant difference between the static and flow-through toxicity values with highly volatile compounds. Flow-through tests provide information on toxic effects during continuous exposure of the organism to a constant concentration of a chemical while the static test provides one initial exposure of a nominal concentration. Oxygen is replenished, waste products removed, and fish are fed daily in the flow-through procedure. The static acute fish toxicity test is applicable when the compound is soluble in water and will remain in solution for a specified period of time. Because of the high volatility of the chlorinated solvents studied, the flow-through method was considered the appropriate test system. (EIS-Deal)

Trace metal concentrations in the waters of the Gulf of St. Lawrence and the Scotian Shelf and their sensitivity to changes in the composition of the major contributor of freshwater, the St. Lawrence River, are assessed. Comparison of the levels of trace metals in eastern Canadian coastal waters with those of other coastal waters of the world reveals that the former area generally has lower trace metal concentrations and is, therefore, probably less contaminated than elsewhere. The increased anthropogenic activity in the St. Lawrence drainage basin required to increase the levesl of trace metals in receiving coastal waters by detectable amounts is discussed. We demonstrate that faster and more reliable warning of changes due to anthropogenic activity will be revealed through river monitoring than through monitoring of coastal waters. Changes in the marine environment can then be assessed through a thorough understanding of the geochemical behavior of trace metals in nearshore waters. (EIS-Deal)

A spring and summer environmental inventory was made on the Cedar Creek Basin, Kansas, and an 18-km stretch of the Cottonwood River downstream from its confluence with Cedar Creek. Environmental qualities of the major streams in the basin were determined by species diversity indices and relative abundance of benthic fauna. A total of 105 taxa was collected. Diversity index (d) values for Cedar Creek and its 5 major tributaries were all above 3, indicating that these streams had excellent water quality. There was a significant difference (P = .05) between the Cedar Creek Basin streams and the Cottonwood River, where the d values were all less than 3. Only 56 taxa were collected from the Cottonwood River stations. With few exceptions, the benthic fauna at all stations was dominated by Trichoptera, Ephemeroptera, Elmidae, Chironomidae, Sphaeriidae and Dugesia. Caddis flies (Trichoptera) and fingernail clams (Sphaeriidae) were the most important members of the benthic fauna, constituting 50% or more of the total ash-free biomass at most stations.--Copyright 1974, Biological Abstracts, Inc.

POLLUTION IN RUNOFF FROM NONPOINT SOURCES,
Florida Univ., Gainesville. Dept. of Agricultural Engineering.
K. L. Campbell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 279, Price codes: A04 in paper copy, A01 in microfiche. University of Florida Water Resources Research Center Publication No. 42, 1978. 49 p, 10 fig, 21 tab, 32 ref. OWRT B-023-FLA(1), 14-31-0001-5064.

Descriptors: *Nutrients, Water quality, *Nonpoint pollution, Mathematical models, Path of pollutants, Water pollution sources, *Nitrogen, *Phosphorus, *Fertilizers, *Agricultural runoff.

The increasing concern for the quality of our environment demonstrates the importance of gaining an increased understanding of the mechanisms and processes involved in nutrient movement from diffuse sources. In this study, nitrogen and phosphorus loads were determined for two agricultural watersheds: one primarily in native forest cover and the other primarily in intensive crop production. Small plots were used to evaluate the effects of selected cultural and water management practices on nitrogen and phosphorus loads in surface runoff from sandy soils. In both locations, nitrogen and phosphorus losses in runoff were very small compared with amounts received by the land area in precipitation and commercial fertilizer. Techniques were developed to simulate nitrogen movement through agricultural watersheds. Simulation models are an effective tool to assist in gaining a better understanding of the complex processes and interactions that occur in a watershed system. They can help in identifying which processes are most important in controlling nitrogen movement within a watershed. (Morgan-Florida)

EFFECTS OF SOIL INJECTION OF LIQUID DAIRY MANURE ON THE QUALITY OF SURFACE RUNOFF,
Kentucky Water Resources Research Inst., Lexington.
I. J. Ross, S. Sizemore, J. P. Bowden, and C. T. Haan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 278, Price codes: A05 in paper copy, A01 in microfiche. Research Report No. 113, 1978. 73 p, 43 fig, 1 tab, 1 ref. OWRT B-047-KY(1), 14-34-0001-6082.

Descriptors: Soil contamination, Soil management, *Soil moisture, *Soil treatment, Soil water, Soil water management, Soil water movement, *Farm wastes, *Injection, *Path of pollutants.

Liquid dairy manure has been injected on the soil contour to depths of 6 and 12 inches and applied to the surface of a Bluegrass sod and a bare tilled soil. Application rates of 9.250 gallons per acre were used. Runoff from 9-foot-square plots which were sprinkled at rates of 2.5 inches per hour on sod and 1.5 inches per hour on bare soil was collected and analyzed for various pollution parameters including COD, N, TSS, pH, DO, and fecal coliform. The effects of pollutant yield in the runoff have been determined for various treatments. Injection of the manure into the soil essentially eliminated any pollutant yield in the runoff from the test plots as compared with surface application. Also, injection tended to even the rate of pollutant loss in the runoff. Increasing the delay-time between application of liquid manure and the simulated rainfall event significantly decreased the yield of pollutants in the runoff. Repeated yearly applications of manure on sod reduced pollutant concentration in runoff and also reduced runoff rates. Test results indicate that pollutant concentration in runoff is a function of the concentration in the liquid manure and the total quality of runoff. (Huffsey-Kentucky)
W79-00528

INFLUENCE OF WATER AND FERTILIZER MANAGEMENT ON YIELD AND WATER-INPUT EFFICIENCY OF CORN,
Florida Univ., Quincy.
F. M. Rhoads, R. S. Mansell, and L. C. Hammond.
Agronomy Journal, Vol. 70, p 305-308, March-April, 1978. 2 fig, 4 tab, 9 ref. OWRT A-026-FLA(13), 14-34-0001-6010.

Descriptors: *Corn(Field), Infiltration, Trickle irrigation, *Herbicides, *Fertilizers, Soils, Kinetics, Herbicide sorption(Soils), Soil pH, Fertilization, Nutrient uptake, Soil water movement.

Damaging plant water stress develops in corn grown on coarse-textured, low water retaining soils of the southeastern U.S. during 1 to 2-week periods without rainfall. However, in most years rainstorms cause leaching of soluble fertilizers from the root zone. This study was conducted to evaluate efficiency of water input in terms of corn grain yield per unit of water, with two fertilizer application methods under three soil-water management systems on a Troup loamy sand (Grossarenic Paleudult). Water management consisted of (1) control - natural rainfall only, (2) trickle irrigation scheduled daily (0.64 cm/day), and (3) trickle irrigation scheduled by tensiometer (1.30 cm/application). Tensiometers were placed in each treatment at six depths between 15 and 150 cm below the soil surface and readings were recorded daily. Methods of applying fertilizers were designated (1) conventional - 1/3 of N and all P and K applied broadcast preplant, and remainder of N applied in two side-dressings; (2) program fertilization - N-P-K applied broadcast in small increments (5, 5, 10, 20, 20, 20 and 20%) at 2-week intervals after corn emerged. Average grain yields for the above water management treatments were 2,790, 4,160, and 5,700 kg/ha respectively. Conventional fertilization had an average grain yield of 3,680 kg/ha and program fertilization 4,760 kg/ha.

Water-input efficiencies based on grain yields and total water input were 57, 42, and 76 kg/ha/cm for no irrigation, daily irrigation, and tensiometer scheduled irrigation respectively. (Morgan-Florida)

PREDICTION OF HEAVY METAL UPTAKE BY MARSH PLANTS BASED ON CHEMICAL EXTRACTION OF HEAVY METALS FROM DREDGED MATERIAL,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
C. R. Lee, R. M. Smart, T. C. Sturgis, R. N. Gordon, Sr., and M. C. Landin.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A054 129, Price codes: A02 in paper copy, A01 in microfiche. Technical Report D-78-6, February 1978. 107 p, 18 tab, 14 fig, 48 ref, 2 append.

Descriptors: Zinc, Copper, Cadmium, Lead, *Heavy metals, *Marsh plants, Sampling, Waste disposal, *Dredged material, Plant populations, DTPA extraction, Absorption, Chromium, Nickel, Mercury.

Extensive field sampling of marsh plants and dredged material from U.S. Army Corps of Engineers disposal sites was conducted along the East and Gulf Coasts of the United States. Marsh plant species studies included Spartina alterniflora, Spartina patens, and Distichlis spicata. Four procedures for the extraction of heavy metals from soil were evaluated including water soluble, ammonium acetate exchangeable, dilute acid extractable, and DTPA extractable. Results indicated that most marsh plants colonizing dredged material disposal sites sampled in this study contained relatively low concentrations of Zn, Cu, Cd, Pb, Cr, Ni, and Hg. These concentrations were very similar to those reported for natural coastal marshes. In a few locations, however, the concentrations of Zn, Cu, Cd, and Pb in the marsh plants were an order of magnitude greater than the concentrations measured in the majority of marsh plants. DTPA extraction of heavy metals gave the best correlations with actual heavy metal concentrations in marsh plants. Marsh plant uptake of Zn, Cu, Cd, and, to some extent, Pb and Cr from dredged material can be predicted using a DTPA extraction procedure. (WES)

RUNOFF FROM FEEDLOTS AND MANURE STORAGES IN SOUTHERN ONTARIO,
Department of Agriculture, Ottawa (Ontario). Engineering Research Service.
D. R. Coote, and F. R. Hore.
Canadian Agricultural Engineering, Vol. 19, No. 2, December 1977, p 116-121. 6 tab, 21 ref.

Descriptors: *Feedlots, *Agricultural runoff, *Manure storage, *Suspended solids, *Water pollution sources, *Ontario, *Canada, Paving, Nutrients, Equations, Regression analysis, Cattle, Seasonal, Precipitation(Atmospheric), Forecasting, Agriculture.

Suspended solids was the most critical water quality parameter found during monitoring of quantity and quality of runoff from paved and unpaved cattle feedlots and paved solid and semi-solid manure storages in southern Ontario, Canada in 1973-75. Suspended solids concentration was significantly related to total solids; biochemical oxygen demand; total Kjeldahl, ammonia, nitrate, and nitrite nitrogen total phosphorus; and orthophosphate phosphorus. A procedure was developed for predicting runoff quantities from individual runoff events using regression equations of runoff on precipitations. A prediction procedure is also presented for water quality parameters. Runoff values (as percentages of precipitation after commencement of runoff) were lower for the feedlots studied than for similar sites in the midwestern U.S. Runoff water quality was more variable and less predictable than quantity, and no runoff was of acceptable quality for direct discharge to receiving waters. Statistically significant differences were found among the four sites monitored and between summer and winter runoff for most water quality parameters. Runoff volumes and water quality concentrations were combined to estimate nutrient losses from each site on a per-animal unit basis. Results can be used in volumetric design of runoff detention structures, and as a nutrient loadings guide for crop production systems incorporating land application of runoff. (Lynch Wisconsin)

NITRATE-NITROGEN IN EFFLUENT FROM AGRICULTURAL TILE DRAINS IN CALIFORNIA,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
J. Letey, J. W. Blair, D. Devitt, L. J. Lund, and P. Nash.
HILGARDIA, Vol 45, No 9, December 1977, p 289-319. 12 fig, 8 tab. NSF-RANN GI-34733X.

Descriptors: *Nitrates, *Nitrogen, *California, *Tile drainage, *Agricultural runoff, *Effluents, Water pollution sources, Nutrients, Fertilizers, Agriculture, Irrigation, Drainage, Soil types, Basins, Small watersheds.

Quantity and concentration of nitrate-nitrogen in tile drainage and its relationship to soil, crop, fertilizer inputs, and water application timing were determined for several California valleys. Tile drainage effluents were monitored at 55 sites on farms in the Imperial, Coachella, Ventura-Oxnard, San Joaquin, and Salinas Valleys. Questionnaires and personal interviews were used to obtain local information on land use, fertilizer applications, and irrigation. It was concluded that: (1) Nitrate-nitrogen concentrations in the tile effluent were not well-correlated with fertilizer application rate, effluent volume, or soil profile properties. (2) Amount of nitrate-nitrogen lost through tile effluent was well-correlated with total water discharge, fertilizer application, and soil profile characteristics; lowest amounts were associated with soil profiles having layers of clay or silty clay; the best correlation was between amount of tile effluent volume. (3) Alluvial soils in the western San Joaquin Valley contained significant native nitrogen, contributing both to high nitrate-nitrogen concentrations and total mass emissions in tile effluent. (4) Low nitrate-nitrogen concentrations and mass emissions occurred where alfalfa was the crop and no nitrogen fertilizer was used. (5) Soils with clay or silly clay layers had lower total nitrate-nitrogen emission, while highest losses were on sandy profiles receiving relatively high quantities of nitrogen fertilizer. (Lynch-Wisconsin)

CHANGES IN THE CHARACTER OF MEADOW PLANT COMMUNITIES INDUCED BY THE OVERFLOW AND STAGNATION OF SALT WATER, (IN POLISH),
Polish Academy of Sciences, Krawkow. Inst. Uprawy Roli Roslin.
Fragm Florist Geobot (Cracow), 23 (1), p 68-76, 1977.

Descriptors: Agropyron-Repens, Atriplex-Hastatum, Var-Salinum, Calcium, Chlorides, Halophytes, *Poland, Potassium, Puccinellia-distans, Salts, Sodium, Soils, Spergularia-saina, Water pollution, *Salinity, *Saline water, *Salt mines, *Plant physiology, Plant growth.

The overflow and stagnation of salt waters coming from the Wieliczka (Poland) salt mine induced changes in the character of plant communities. Where saline waters stagnated longest the vegetation of meadows underwent total destruction, and artificial salt flat arose with soil of a high Na, Ci, Ca content. On the other hand, in the places over which salt waters ony flowed or impregnated the soil much smaller changes occurred in the chemical compostion of the soil and in the specific composition of the meadow plant communities. The areas most impregnated with salt were gradually dominated by such halokphilous species as Spergularia salina, Atriplex hastatum var. Salinum and Puccinellia distans. In places in which the influence of salt waters was of short duration, the percentage of haophytes in the meadow plant communities was much smaller and the predominat plants were of the alliance agropyro Rumicion Crispi with Agropyron repens as the dominat species. In the areas bordering the limit of salt waters the species typical of meadow communities survived, and the portion of nitrophilous plants amount them was only slightly greater. In unsodded places there appeared single specimens of p. distans. The latter plant occurred in all areas but varied in number, its quantity corresponding to the degree of soil salinity.- coyright 178, Biological Abstracts, Inc.

THE OTHER WATER POLLUTION (NONPOINT SOURCE POLLUTION),
K. Barton.
Environment, Vol. 20, No. 5, p 12-20, June, 1978. 1 tab.

Descriptors: *Water pollution sources, *Sediments, *Urban runoff, *Federal water pollution control act, Water pollution control, Pollutant identification, Agricultural runoff, Mining, Construction, Septic tanks, Landfills, Groundwater movement.

The 1972 Federal Water Pollution Control Act (FWPCA) requires control of nonpoint as well as point sources of water pollution. Nonpoint source pollution consists of all water pollution that is not released at one specific identifiable point. Approximately 50 percent of the nation's water pollution is estimated to be from nonpoint sources. The federal water pollution control program under the FWPCA has proven to be seriously inadequate in the nonpoint area. Nonpoint source pollution consists primarily of runoff. The Federal Environmental Protection Agency (EPA) groups nonpoint pollution sources into eight categories: (1) silviculture; (2) agriculture; (3) mining; (4) road and building construction; (5) saltwater intrusion; (6) subsurface excavations; (7) hydrologic modification; and (8) urban runoff. The major pollutant from nonpoint sources is sediment; agriculture runoff is its main source. Urban runoff is said to be as serious a problem as agriculture in many areas. Best management practices is the term used by the EPA for the various methods for reducing nonpoint pollution. The methods of control are as varied as the sources and several methods are examined. The article explores the theory behind the Clean Air Act and how it has been put into practice. (Quarles-Florida)

POTENTIAL EFFECTS OF DEEP-WELL WASTE DISPOSAL IN WESTERN NEW YORK,
Geological Survey, Albany, NY. Water Resources Div.
R. M. Waller, J. T. Turk, and R. J. Dingman.
Available from Supt. of Documents, GPO Washington, DC 20402, Price $1.90. Professional Paper 1053, 1978. 39 p, 18 fig, 5 tab, 36 ref.

Descriptors: *Model studies, *Underground waste disposal, *Injection wells, *Geochemistry, *Chemical reactions, Acids, Iron compounds, Hydrogeology, Aquifer characteristics, Hydraulic properties, Pressure head, Laboratory tests, On-site tests, Hydrofracturing, *Waste pickling liquor, *Steel industry, Western New York.

Mathematical and laboratory models were used to observe, respectively, the hydraulic and chemical reactions that may take place during proposed injection of a highly acidic, iron-rich waste pickle liquor into a deep waste-disposal well in western New York. Field temperature and pressure conditions were simulated in the tests. Hydraulic pressure in the middle stages of the initial (1968) injection test had probably hydraulically fractured the Cambrian sandstone-dolomite formation adjacent to the borehole. Transmissivity of the formation is 13 feet squared per day. The proposed rate of injection (72,000 gallons per day) of waste pickle liquor would approach a wellhead pressure of 600 pounds per square inch in about a year. Hydraulic fracturing would reoccur at about 580 pounds per square inch. The measurable cone of influence would extend about 22 miles after injection for 1 year. Chemical reactions between acidic wastes and brine-saturated dolomite would create precipitates that would drastically reduce the permeability of the unfractured part of the dolomite. Nondolomitic sandstone permeability would not be affected by chemical reactions, but the pores might be plugged by the iron-bearing waste. The digital model can be used for qualitative predictions on a regional scale. (Woodard-USGS)

A COMPUTER MODEL OF THE POPULATION OF CHIRONOMIDS (IN RUSSIAN),
Akademiya Nauk Latviiskoi SSR, Riga. Inst. of Biology.
G. V. Titarenko.
Zool Zh 56(4), p 530-537, 1977.

Descriptors: Biomass, *Chironomus-plumosus, *Computer models, *Energy flow, Food, *Mathematical models, Predation, Production, Weight, *Model studies, Distribution.

A mathematical model was constructed to represent the energy flow through a hypothetical population of Chironomus plumosus L. The model describes the state of the population as a numerical distribution of individual weights for every 5 days during the year. The weight growth rate depends on interspecific competition. Some characteristics of production dynamics as function s of the amount of food and the given: pressure of predators are biomass (B) production (P) and P/B. The model was produced on the computer.--Copyright 1978, Biological Abstracts, Inc.

EFFECTS OF A COASTAL FRONT ON THE DISTRIBUTION OF CHLOROPHYLL IN LAKE TAHOE, CALIFORNIA-NEVADA,
California Univ., Davis. Div. of Environmental Studies.
M. R. Leigh-Abbott, J. A. Coil, T. M. Powell, and P. J. Richerson.
Journal of Geophysical Research, Vol 83, No C9, p 4668-4672, September 20, 1978. 8 fig, 13 ref. NSF DEB76-20341.

Descriptors: *Lakes, *California, *Nevada, *Chlorophyll, *Water temperature, On-site investigations, Sampling, Temperature, Winds, Data processing, Fluorescence, Coasts, Shores, Topography, Lake morphology, Limnology, *Lake Tahoe, Water fronts.

The existence of a distinct coastal zone was confirmed in Lake Tahoe (California-Nevada) by horizontal transects measuring chlorophyll and temperature simultaneously. Creation of the coastal region is influenced by bottom topography, the nature of the surface wind stress, and the difference between physical processes occurring within a Rossby radius of deformation and those occurring in midlake. Chlorophyll records from horizontal transects were decomposed by spectral analysis, and the normalized sectra from nearshore and midlake were compared. The two regions were found to differ at large scales, primarily because of differences in nutrient import, and at intermediate scales because of differences in the mixing regime. The coastal zone was observed to erode with increasing winds and weakening stratification, leading to little significant difference between nearshore and midlake chlorophyll patterns. (Sims-ISWS)

DISSIPATION OF HEAT FROM COOLING PONDS,
Bhabha Atomic Research Centre, Bombay (India).
R. S. D'Souza, and T. P. Sarma.
Indian Journal of Meteorology, Hydrology, and Geophysics, Vol. 28, No. 4, p 459-464, October 1977. 4 fig, 2 tab, 12 ref.

Descriptors: *Cooling water, *Ponds, *Heated water, *Model studies, Mathematical models, Temperature, Air temperature, Water temperature, Winds, Humidity, Heat, Heat flow, Heat transfer, Dispersion, Energy dissipation, Powerplants, Nuclear powerplants, *India, Heat dissipation, Cooling ponds.

A mathematical model was proposed for the planning of cooling ponds used for dissipation of waste heat from heated discharge waters of power generating stations. This dissipation of waste heat was found to be mainly dependent on wind speed and water temperature, was influenced negligibly by air temperature and humidity, and was independent of solar radiation. The model's special application is where the water resources are limited and recycling of water used for cooling the condenser waters of the power station is necessary. The models showed that the acreage requirements of the cooling ponds of such types of the order of 1.0 to 2.5 acres/Mw (e) during the hotter months at Bombay. Data were collected also at Tarapur Atomic Power Station's discharge channel, and the model calculations compared well with the actual temperature fall in the channel observed during low tide. CHARACTERIZATION OF CONFINED DISPOSAL AREA INFLUENT AND EFFLUENT PARTICULATE AND PETROLEUM FRACTIONS,
University of Southern California, Los Angeles. Environmental Engineering Program.
J. C. S. Lu, Eichenberger, B. Kenezevic, and K. Y. Chen Miroslav.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-16, May 1978. 178 p, 8 tab, 29 fig, 19 ref, 3 append.

Descriptors: *Effluents, *Sedimentation, *Water quality, *Oil pollution, Influents, *Dredged material disposal, Dredged material, *Waste disposal sites, *Trace metals, Particulates.

Analyzes contaminants in influents and effluents from confined dredged material disposal areas at Pinto Island, Mobile Bay, Alabama, and Grassy Island, Detroit, Michigan. Samples were separated into 0.05-u, 0.45-u, and 8.0-u fractions. The total sample and filtrate were analyzed for metals, nutrients, total carbon, organic carbon, chlorinated hydrocarbons, oil ad grease, sulfide, and solids contents. Results show that, in general, the removal efficiency of total trace metals was similar to the total solids removal. These results agree with the analytical data which show that approximately 99% of the total trace metals was associated with the solid settleable phase (> 8-u). The total trace metal concentrations in the effluents at both disposal sites were significantly greater than the marine water quality requirements. Therefore, confined disposal operations will require either long detention times or treatment in order to meet applicable water quality stndards. On the other hand, it may be necessary to amend appropriate water quality criteria to differentiate the ecological significance of soluble and particulate fractions so that meaningful water quality criteria can be established.

PREDICTING PESTICIDE RUNOFF FROM AGRICULTURAL LAND: A CONCEPTUAL MODEL,
Southeast Environmental Research Lab., Athens, GA.
G. W. Bailey, R. R. Swank, Jr., and H. P. Nicholson.
J Environ Qual. 3(2), p 95-102, 1974.

Descriptors: *Agricultural runoff, Land use, Microorganisms, *Model studies, *Pesticides, Rainfall, Soil, Water pollution sources, *Forecasting, *Pesticide residues, Path of pollutants.

A mathematical model of the dynamic, single-rainfall-event type is being developed to describe quantitatively pesticide runoff as a function of pesticide and soil properties, agricultural practices watershed characteristics and climatic factors. From the model, guidelines governing pesticide use will be derived to prevent or minimize water pollution resulting from runoff from agricultural land. The model described is based on a state-of-the-art approach. Pesticide transport is 'piggybacked' on existing hydrologic and soil-loss models. Both direct mass-balance and area 1 averaging-statistical simulation approaches are being considered for the basic runoff and sediment transport descriptors. The conceptual structure of the overall model includes: source term effects (parameters that determine the initial concentration of pesticide available for runoff) e.g., pesticide formulation, physical-chemical properties and initial spatial distribution; loss of pesticide from the surface zone between rainfall events by various attenuation processes (volatilization, microbial, chemical, and photochemical degradation, and organism uptake); and loss of pesticide from the soil surface during runoff-producing rainfall events because of mass transfer from soil surface into the moving runoff film and pickup of sediment containing pesticide particulates. The minimum output requirements for the model are the prediction of runoff rate and sediment loading plus the corresponding water and sediment phase pesticide concentrations at a designated boundary (normally a watershed confluence or drainage channel) as a function of time during a runoff event. This output is to be based upon input consisting of the type, formulation, and rate and method of application of the pesticide, and the areal extent, topography, type of soil, cropping characteristic and rainfall characteristic of the watershed or basin. The model will internally generate and store the appropriate boundary condition changes required to predict sequential rainfall response using between-event meteorological data as input.--Copyright 1974, Biological Abstracts, Inc.

THE ADSORPTION-DESORPTION OF DIURON BY FRESHWATER SEDIMENTS,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
D. E. Park.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 411, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, June, 1977, 48 p, 9 fig, 14 tab, 28 ref. (California Water Resources Center Project UCAL-WRC-W-485).

Descriptors: *Adsorption, *Desorption, Soil sciences, Pesticides, *Diuron, *Sediments, California, Organic carbon, Freundlich equation.

Freshwater sediments were collected from 8 locations in California to study their adsorption and desorption of diuron. The sediments were characterized as to physical and chemical properties using the same methods used for soils. The sediments have a range of organic carbon of .91 - 19% and are high in silt and clay. The organic carbon was correlated with CEC of organic matter and inversely correlated to pH and clay content. Most of the sediments had a C:N ratio equal to that of soils. The adsorption of diuron could be described by the Freundlich equation. Adsorption expressed as the Freundlich coefficient k, was correlated to the amount of organic carbon present. As the organic carbon increased, adsorption of diuron increased. There was no correlation with total CEC. The desorption of diuron was evaluated by taking the difference between the slope of the adsorption and desorption isotherms. These differences were positively correlated to k and organic carbon. As the difference between these slopes increased, the less diuron desorbed. Finally, adsorption was determined at two additional temperatures of 5C and 40C on 3 sediments. As the temperature increased, the adsorption of diuron decreased. (Snyder-Calif, Davis)

MATHEMATICAL MODEL FOR MULTIPLE COOLING TOWER PLUMES,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Hydraulics and Water Resources.
F. H. Y. Wu, and R. C. Y. Koh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 364, Price codes: A07 in paper copy, A01 in microfiche. Report No EPA-600/7-78-102, June 1978. 134 p, 25 fig, 34 ref, 3 append. EPA (5) R-803989-01-1.

Descriptors: *Path of pollutants, *Mathematical models, *Cooling towers, *Plumes, *Model studies, Environmental effects, Air pollution, Moisture, Humidity, Laboratory tests, Forecasting, Simulation, Hydraulic models, Estimating, Computer models, Liquid phase moisture, *Thermal pollution, Heat transfer, Temperature.

A mathematical model was developed for predicting properties of moist plumes emitted from cooling towers as a means of assessing environmental impact of these systems. The properties investigated include: excess plume temperature, humidity and liquid phase moisture (water droplet), plume trajectory, width, and dilution at the merging locations, and the beginning and ending points of the visible part of the plumes. Based on comparison with laboratory data, this model gives good predictions for the case of dry plumes where no moisture is involved; however, several empirical coefficients are not yet known accurately. Verification of this model for wet plumes, such as the prototype cooling tower plumes, and determination of the values for these empirical coefficients to be used in prototype applications must await detailed comparison with field data. LABORATORY AND FIELD MEASUREMENTS OF UPWELLED RADIANCE AND REFLECTANCE SPECTRA OF SUSPENDED JAMES RIVER SEDIMENTS NEAR HOPEWELL, VIRGINIA,
National Aeronautics and Space Administration, Langley Station, VA. Langley Research Center.
C. H. Whitlock, W. G. Witte, E. A. Gurganus, and J. W. Usry.
Available from the National Technical Information Service, Springfield, VA 22161 as NASA TP-1292, Price codes: A03 in paper copy, A01 in microfiche. Report No NASA TP-1292, October 1978. 27 p, 10 fig, 3 tab, 6 ref, 1 append.

Descriptors: *Sediments, *Reflectance, *James River, *Suspended solids, Turbidity, Laboratory tests, Optical properties, On-site data collections, Model studies, Hopewell, Virginia, Ratio techniques, Remote sensing, Pollutants, Water pollution effects, Dredging.

Laboratory and field measurements of spectral reflectance characteristics were made of bottom sediments and water taken from the area near Hopewell, Virginia. Sediments taken from Bermuda Hundred and Bailey Bay were measured in the laboratory for total suspended solids concentrations between 4 and 173 ppm. Also, field measurements of spectral reflectance were made on water from the James River near Bermuda Hundred on two occasions. Results indicate that both Bermuda Hundred and Bailey Bay suspended sediments produce their strongest reflectance in the green and red regions of the spectrum and the general spectral characteristic of Bermuda Hundred suspended sediments is similar to that observed for the James River, with differences related to such factors as spectral resolution, algae content, and particle size distribution. However, the magnitude of reflectance values is quite different between laboratory and field results. Ratio techniques should prove useful for applying remote sensing data to distinguish Bailey Bay sediments from James River sediments in high turbidity plumes, as may occur in dredging. Improved laboratory procedures are needed to simulate spectral reflectance of natural waters in the laboratory and additional tests are recommended to develop and validate these procedures. Such simulations could aid in understanding the effects of adding pollutants and make possible remote sensing to detect pollutants in bottom sediments disturbed by dredging. (Majtenyi-IPA)

DOMES UPPER WATER PHYSICAL OCEANOGRAPHY, A COMPONENT OF THE DOMES PROGRAM,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
D. Halpern.
Deep Ocean Mining Environmental Study (DOMES) Final Report No. 26 (1978) 43 p 23 fig, 3 tab, 9 ref.

Descriptors: *Oceanography, *Baseline studies, *Resources development, Hydrography, *Deep Ocean Mining Environmental Study(DOMES), Ocean mining, Physical oceanography.

Although the primary environmetal impact produced by mining operations will be related to the chemistry and biomass of the region, accurate definition of the environmetal conditions is dependent upon sufficient knowledge of the physical oceanography. The objectives of the DOMES Upper WAter's Physical Oceanograpy component were determined in collaboration with the Principal Investigators of the DOMES Program at a meeting held in Seattle in October 1975. The Objectives were: description of vertical section of temperature, salinity ad density within the upper 1000 m; relative geostrophic curents from analysis of hydrographic measurements; Description of the temporal variability of currents at fixed-levels at each site; description of the thichness of the mixed layer; and description of the temporal variations of wind speed and direction at each site. Data are shown in charts and tables. (NOAA)

TRACE METAL BASELINES IN THE DOMES STUDY AREA,
Washington Univ., Seattle. Dept. of Oceanography.
M. L. Healy.
NOAA/ERL, Pacific Marine Environmental Lab, Deep Ocean Mining Environmental Study (DOMES), Final Rept No. 27. July 1976. 8 p, 2 tab. 03-6-002-35117.

Although the nature and distribution of trace metals in the open ocean is yet open to question, the majority of recent determinations by modern techniques place their Concentrations in the subparts per billion range. The EPA standards (NAS, 1972) for seawater report the hazard level for certain metals as: Fe-300, Mn-100, Pb-50, and Cd-10 ppb. If the discharge plume concentrations from mining operations involve a dilution factor of 10 to the power of 3, and if the increases due to mixing observed in these preliminary data are representative, then it can be concluded that the increases in seawater trace metal concentrations due to the mining operations will be hard to detect. (NOAA)

NITROGEN FERTILIZER MANAGEMENT OF A LEMON ORCHARD AS RELATED TO NITRATE-POLLUTION POTENTIAL OF GROUND WATER,
California Univ., Riverside. Dept. of Soil Science and Agriculture Engineering.
C. Pallares.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 570, Price codes: A06 in paper copy, A01 in microfiche. Doctor of Philosophy Dissertation, January 1978. 98 p. 15 fig, 21 tab, 66 ref, append. OWRT A-057-CAL(1).

Descriptors: *Citrus fruits, *Lemons, *Nitrogen, Nitrites, Groundwater, Irrigation effects, Fertilizers, Water pollution sources, Path of pollutants, California.

A replicated experiment was conducted in Ventura County, California on vigorous lemon trees (Limoneira 8a Lisbon lemon). Differential treatments were started in 1973 and continued through 1976. The objective was to develop nitrogen (N) fertilizer management practices that reduce the potential NO3 pollution of ground waters without having adverse effects on lemon fruit yield and quality. The treatments were designed to investigate the effects of rate, time and method of application on N usage and leaching by a lemon orchard under mulch and no-mulch conditions. Nitrogen balances were calculated. In the balance model, the N in the fertilizer and in the irrigation water were considered as inputs; outputs were N leached and removed in the fruit. Discrepancies between inputs and outputs were attributed to N mineralization from the organic pool, or N immobilization and gaseous losses of N. The N leached was calculated by multiplying the volume of drainage water by its NO3-N concentration at a 167-cm depth. The volume of drainage was estimated by a chloride balance model and measurements of the volume of irrigation water applied to the experimental block. (Snyder-Calif Davis)

DISTRIBUTION AND ABUNDANCE OF BENTHIC MACROFAUNA IN THE SEWAGE SLUDGE DISPOSAL AREA, NEW YORK BIGHT APEX, FEBRUARY 1975,
National Oceanic and Atmospheric Administration, Boulder, CO. Marine Ecosystems Analysis Program Office.
J. Pearce, J. Caracciolo, M. Halsey, and L. Rogers.
NOAA Data Report ERL MESA-36, November 1977. 38 p, 2 fig, 1 tab, 6 ref.

Descriptors: *Benthos, *Sewage sludge, Sewage disposal, *Outer Continental Shelf, *New York Bight, Ecological distributions, Marine Ecosystems Analysis Program(MESA).

Sandy Hook Laboratory has been examining the impact of ocean waste disposal on the ecosystem of the New York Bight apex since 1968. The benthic community in the apex has been used to indicate impacts because certain bottom-dwelling organisms are often the first to be demonstrably affected by pollutants. The present data report was prepared in order to provide machine listed data and certain statistical calculations, diversity and equitability concerned with the distribution and abundance of benthic organisms found at 24 stations 'nested' within the sewage sludge disposal area of the standard N.Y. Bight, MESA sampling grid. These 'nested' samples will yield additional information on the impact of dumping in the New York Bight by providing a better distributional statistical base and will be used in comparisons with earlier data collected from the same area. (NOAA)

TIDAL AFFECTED DISTRIBUTIONS OF SURFACE CHLOROPHYLL AND TRANSPARENCY IN THE NEW YORK BIGHT,
Environmental Research Inst. of Michigan, Ann Arbor. Infrared and Optics Div.
D. R. Lyzenga, and F. C. Polcyn.
Final Report to NOAA, National Environmental Satellite Service, October 1977. 43 p, 18 fig, 3 tab, 9 ref. 04-6-158-44073.

Descriptors: *Chlorophyll, *Tidal effects, *Water quality, Remote sensing, Color, *Distribution, Outer Continental Shelf, *New York Bight, Transparency.

Multispectral data at two altitudes and two times of day were analyzed. The red/blue and red/green reflectance ratios appear to be useful indicators of chlorophyll and total particulate concentration (or Secci disk transparency) in water. The red/blue ratio technique is sensitive to atmospheric affects. Calculation of atmospheric effects using theoretical models is useful for lending insight into this problem. The second derivative technique holds promise as an indicator of water quality which is relatively insensitive to atmospheric effects. Further empirical and theoretical investigations need to be done with data from various altitudes and water types to establish the limitations of this technique. (NOAA)

POLYCHLORINATED BIPHENYLS, CHLORINATED PESTICIDES AND TRACE METALS IN SOILS OF THE EVERGLADES NATIONAL PARK AND ADJACENT AGRICULTURAL AREAS,
National Oceanic and Atmospheric Administration, Miami, FL. Atlantic Oceanographic and Atmospheric Labs.
A. G. Requejo, R. H. West, G. R. Harvey, P. G. Hatcher, and P. A. McGillivary.
NOAA Technical Memorandum ERL AOML-32, October 1977. 45 p, 24 fig, 5 tab, 7 ref.

Descriptors: *Polychlorinated biphenyls, *Chlorinated hydrocarbon pesticides, *Water pollution sources, Soils, Pesticides, *Florida, Copper, *Metals, *Trace metals, *Everglades, National Park(Fla).

Soil samples collected in May, 1976, from the eastern Everglades National Park and adjacent farmlands were analyzed for polychlorinated biphenyls (PCB's), certain chlorinated pesticides, and trace metals. The results indicate that although concentrations of PCB's, DDT's, Chlordane, and copper are high at agricultural sites, little horizntal movement of these compounds has occurred. In addition, black plastic is identified as the source of PCB's in the area, but the input of these compounds into the Park is minor. (NOAA)

THE AMOCO CADIZ OIL SPILL. A PRELIMINARY SCIENTIFIC REPORT,
National Oceanic and Atmospheric Administration, Boulder, CO. Environmental Research Labs.; and Environmental Research Lab., Narragansett, RI.
NOAA/EPA Special Report, 'The AMOCO CADIZ Oil Spill', April 1978. Wilmot N. Hess (Ed.) 354 p, 66 photos.

Descriptors: *Oil spills, *Water pollution effects, *Oil pollution, *Enviromental effects, Coasts, Beaches, France, *Biological effects, *Amoco Cadiz oil spill, Brittany.

A preliminary account of the United States (EPA and NOAA interagency oil spill response team) scientific efforts in response to the Amoco Cadiz oil spill during the period March 19 to May 15, 1978 is provided. Approximately 64,000 tons of oil came ashore along 72 km of the shoreline of Brittany during the first 2 1/2 weeks of the spill. A prevailing westerly wind pushed the oil against west-facing headlands and into shoreline embayments as it moved east. A wind reversa in early April moved the oil in the opposite direction, contaminating previously untouched areas. Coastal processes and geomorphology played a major role in the dispersal and accumulation of the oil once it came onshore. THe grounded mousse was either eroded away, or buried under new sediment deposits, in response to the vagaries of the beach cycle. A significant percentage of the oil is hypothesized to have sunk to the bottom and been subjected to bottom transport processes. Offshore, high concentrations of oil in water were observed, but near-bottom water usually contained even greater quantities of oil. Adverse biological effects of the spill were observed along the northwest coast of Brittany--a distance of about 150 km of coastline plus numerous rocky out croppings and islands. Mariculture operations for oysters were severely affected and intertidal communities on coastlines facing in a westerly direction were severely impacted. (NOAA)

PREFERENTIAL ELIMINATION OF DIELDRIN BY SOME DIATOMS COMPARED TO CHLAMYDOMONAS AND SCENEDESMUS SPECIES,
Marburg Univ. (Germany, F.R.). Fachbereich Biologie.
D. Werner, and E. Morschel.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, No. 3, p 313-319, 1978. 3 fig, 13 ref.

Descriptors: *Dieldrin, *Pesticide kinetics, *Chlamydomonas, *Scenedesmus, *Diatoms, Food chains, Absorption, Aquatic algae, Cytological studies, Path of pollutants, Radioactivity, Techniques, Tracers, Carbon radioisotopes, Pesticide toxicity, Metabolism, *Bioaccumulation, *Biomagnification.

Data was collected on the ability of several species of three genera of microalgae to eliminate the pesticide dieldrin. It was found that Nitschia was better able to eliminate dieldrin than Scenedesmus, which in turn was more efficient than Chlamydomonas. The results did not allow a generalization as to the level of algal classes. (EIS-Deal)

AVIAN CHLOREA AND ORGANOCHLORINE RESIDUES IN AN AMERICAN OYSTERCATCHER,
Fish and Wildlife Service, Laurel, MD. Patuxent Wildlife Research Center.
L. J. Blus, L. N. Locke, and E. Cromartie.
Estuaries, Vol. 1, No. 2, p 128-129, 1978. 8 ref.

Descriptors: *Pathogenic bacteria, *Pesticide residues, *DDE, *Animal diseases, Birds, Animal pathology, Bacteria, Cytological studies, Chlorinated hydrocarbon pesticides, pesticides, Path of pollutants, Organic compounds, Chemical analysis, South Carolina, *Cholera, *Avian chlorea, Pasteurella, Oystercatcher, *Tissue analysis, Cape Romain National Wildlife Refuge.

Pasteurella multocida, the causative bacterium of avian cholera, was isolated from cultures of the liver and heart blood of a female adult American oystercatcher found dead on the Cape Romain National Wildlife Refuge, South Carolina. This is apparently the first record of avian cholera in the oystercatcher. Also, low levels of DDE were identified in tissues of the oystercatcher. (EIS-Deal)

UPTAKE, DISTRIBUTION, AND ELIMINATION OF THE LAMPRICIDE 2', 5-DICHLORO-4'-NITRO(14C) SALICYLANILIDE (BAYER 2353) AND ITS 2-AMINOETHANOL SALT (BAYER 73) BY LARGEMOUTH BASS,
Fish and Wildlife Service, Warm Springs, GA. Southeastern Fish Control Lab.
D. P. Schultz, and P. D. Harman.
Journal of Agricultural and Food Chemistry, Vol. 26, No. 5, p 1226-1230, 1978. 3 fig, 5 tab, 6 ref.

Descriptors: *Bass, *Pesticide toxicity, *Lampreys, Organic compounds, Chemical properties, Chemical analysis, Toxicity, Pesticides, Salts, Techniques, Salts, Tracers, Radioactivity techniques, Carbon radioisotopes, Fish physiology, Animal metabolism, Absorption, *Lampricide, Bayer 73, Bayer 2353, *Tissue analysis, *Bioaccumulation, *Biomagnification.

In two groups of largemouth bass exposed to a 0.05 microgram/mL mixturee of the lampricide Bayer 2353 and its salt, Bayer 73 for 24 or 144 h, radioactivity was found in all tissues and organs analyzes. The concentration was highest in the gallbladder and lowest in the muscle. The actual amount of 140 material in the various tissues, when calculated as a percentage of the total in each fish, did not change significantly from one sampling interval to the next except for the bile and liver. Concentrations of 14C material in tissues and organs were dependent on the loading rate of the fish (weight per unit volume of water) in the exposure solution. In a third group of fish exposed to 0.05 micrograms/mL mixture of the lampricide for 24 h and then transferred to lampricide-free flowing water for as long as 14 days, the concentration of 14C material decreased with time in all organs and tissues except in the gallbladder x bile. There was little biomagnification of lampricide in the edible portion ofthe fish.

POLYCHLORINATED BIPHENYLS IN THE BIOMASS OF THE BALTIC,
Uppsala Univ. (Sweden). Inst. of Zoophysiology.
J. E. Kihlstrom, and E. Bergland.
Ambio, Vol 12, No. 4, p 175-178, 1978. 1 fig, 5 tab, 32 ref.

Descriptors: *Polychlorinated biphenyls, Organic compounds, Path of pollutants, Pesticide kinetics, DDT, Air pollution, Fallout, Commercial fishing, Fish physiology, Animal metabolism, *Biomass, Herrings, Biodegradation, Plankton, Commercial fish, *Tissue analysis, *Bioaccumulation, *Baltic Sea.

In spite of restrictions placed on the use of polychlorinated biphenyls (PCBs), some observations indicate that the concentrations of these substances in Baltic organisms have not yet decreased. In order to improve the understanding of this pollution problem the authors have drawn on recent research to estimate the total quantity of PCBs in the Baltic and clarify the ways these substances may be added to and removed from the Baltic ecosystem. There seems to be between two and three metric tons bound to the organisms, one ton of which is in fishes. Of this amount, 0.3 to 0.6 tons are removed annually in the commercial catch of fishes. The main source of the PCBs in the Baltic seems to be atmospheric fallout. According to the few data available this amounts to approxiately 6 tons per year. This factor may explain why concentrations are approximately the same throughout this area. Moreover, if the figures are correct, they indicate that the amounts of PCBSs in the Baltic might be increasing.

A SIMULATION MODEL FOR LEAD MOVEMENT IN A WATERSHED,
Illinois Univ. at Urbana-Champaign. Inst. for Environmental Studies.
G. L. Wheeler, G. L. Rolfe, and K. A. Reinbold.
Ecological Modelling, Vol. 5, p 67-76, 1978. 2 fig, 2 tab, 10 ref.

Descriptors: *Lead, *Path of pollutants, *Model studies, *Watersheds(Basins), *Soil contamination, Public health, Soils, Movement, Benthos, Illinois, Invertebrates, Heavy metals, Metals, Water pollution sources, Plants, Sediments, Environmental effects, *Automotive emission, Accumulations.

A simulation model of the movement and accumulation of automotively emitted lead in a watershed of Central Illinois is presented. The model is composed of four parallel terrestrial subsystems or zones based on traffic volume, and an aquatic system in series. The model x is used to estimate historical accumulations of lead within the watershed and to compare different scenarios of reductions of lead emissions. Since the introduction of leaded gasoline an estimated 570,000 kg of lead has been emitted in the watershed. Of this total about 36% remained airborne and left the watershed, and 3% left the watershed via the aquatic system. Lead is found to be a significant pollutant in urban areas and near major highways. Without emission controls lead is expected to cause environmetal problems after about 25 years.

METAL ACCUMULATION AND DEPURATION BY THE AMERICAN OYSTER, CRASSOSTREA VIRGINICA,
National Marine Fisheries Service, Milford, CT. Experimental Biological Investigations.
R. A. Greig, and D. R. Wenzloff.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, No. 4, p 499-504, 1978. 4 tab, 9 ref.

Descriptors: *Absorption, *Oysters, *Animal metabolism, Metals, *Silver, *Cadmium, *Copper, *Zinc, Animal physiology, Path of pollutants, Water pollution effects, Sediments, Water chemistry, Water quality, Water analysis, Bioaccumulation, *Depuration, Tissue analysis.

In the present report, accumulation and depuration of silver, cadmium, copper and zinc by oysters were studied in natural systems. Oysters were transferred from relatively unpolluted water to a polluted area in order to quantify accumulation of metals. The reverse was performed for the examination of depuration. Data on accumulation and depuration for each metal are presented and discussed. (EIS-Deal)

EVALUATION OF TOXICITY OF SOME INDUSTRIAL WASTES TO FISH BY BIOASSAY,
Shri Govindram Seksaria Technological Inst., Indore (India). School of Studies in Botany.
R. C. Trivedi, and P. S. Dubey.
Environmental Pollution, Vol 17, p 75-80, 1978. 1 fig, 2 tab, 8 ref.

Descriptors: *Toxicity, *Bioassay, *Industrial wastes, *Zinc, *Mercury, *Textiles, Water pollution sources, Water pollution effects, Mortality, Sulfates, Seasonal, Metals, Lethal limit, Sulfur compounds, Laboratory tests, Water quality, Barbus, Rayon industry.

Toxicities of effluents from caustic and rayon industries to fish (Barbus stigma) were determined by bioassay. Wastes diluted forty times were still found to be lethal. Zinc, mercury, sulphuric acid and organic matter were the main pollutants. The receiving river was found to be unfit for fish growth up to 35km downstream. Some treatments for such wastes are suggested, and the TLm values discussed. (EIS-Katz)

REPORT ON FY 1977 NUMERICAL MODELING IN PUGET SOUND,
National Oceanic and Atmospheric Administration, Boulder, CO. Marine Ecosystems Analysis Program.
C. S. Smyth.
NOAA Technical Memorandum ERL MESA-30, June 1978. 52 p, 13 fig, 14 ref, 3 append.

Descriptors: *Model studies, *Path of pollutants, Floating, Washington, *Mathematical models, Simulation analysis, *Puget Sound(Wash), *Pollutant trajectory models.

A simple single-phase pollutant trajectory model and two basic components, a method for computing surface winds were developed for the Puget Sound region. The model simulates the motion of a number of discrete floting elements under the influence of surface currents, surface winds, and parameterized diffusion. The floating elements may be introduced from several (possibly moving) sources. The computed paths of these elemets approximate the paths that would befolowed by a single-phase floating pollutant. The model is operational and may be accesed bia voice-grade telefphone lines.(NOAA)

FLUORIDE ACCUMULATION IN THE TERRESTRIAL AND AQUATIC COMPONENTS OF THE DOUGLAS CREEK DRAINAGE OF WESTERN MONTANA,
Montana Univ., Missoula. Environmental Studies Lab.
C. C. Gordon, and P. C. Tourangeau.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 277, Price codes: A04 in paper copy, A01 in microfiche. Montana University Joint Water Resources Research Ctr, Bozeman Completion Rpt No. 91, December 1977. 45 p, 23 fig, 1 tab, 24 ref. OSWRT A-070-MONT(1).

Descriptors: *Montana, *Douglas Creek, *Water pollution, *Fluorides, *Water pollution effects, *Aquatic environment, *Environmental effects, Pollutants, Metabolism, Aquatic insects, Trout, Diptera, Ephemeroptera, Industrial pollution, Phosphates, Fluoroapatite, Environmental studies, Sampling, Evaluation, Runoff, On-site investigations.

The accumulation of fluorides in terrestrial and aquatic components of Douglas Creek drainage in western Montana was investigated. Samples were collected from nine sites downstream or adjacent to a phosphorus plant located in the area, seven sites upstream from the plant, and one site on Flint Creek above the confluence with Douglas Creek. Samples included vegetation, sediment, aquatic insects, and water. Of the insects studied, those of the orders Ephemeroptera and Diptera which are herbivores, accumulated substantially more fluoride in their body tissues than those which belonged to carnivore or predator species. This indicates that contaminated foliage falling into Douglas Creek could contribute more fluoride to animals in the creek than fluoroapatite dust washed into creek sediment. Fluoride accumulation in tissues of trout species collected in both polluted and unpolluted sections of the creek demonstrated that a high level of variability occurs in both bone and skin tissues of trout. Although fluoride concentrations in bone and skin tissues of trout were excessively high, it is believed that fluoride pollution of this creek is chronic rather than acute. No evidence was found indicating that fluoroapatite dust reaching the creek during phosphate plant operations has caused any serious depletion in its productivity. There is evidence that the fluoroapatite in Douglas Creek is being diluted by washout. (Majtenyi-IPA)
W79-00504

SURVEY, ECOLOGY, AND SYSTEMATICS OF THE UPPER POTOMAC ESTUARY BIOTA: AUFWUCHS MICROFAUNA, PHASE II,
Georgetown Univ., Washington, DC. Dept. of Biology.
D. M. Spoon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 041, Price codes: A04 in paper copy, A01 in microfiche. Washington Technical Institute Water Resources Research Center Report No. 8, August 1976. 42 p, 22 fig, 11 tab, 8 ref. OWRT B-006-DC(1).

Descriptors: *Model studies, *Sewage effluents, *Sewage bacteria, *Aquatic bacteria, *Fishkill, *Potomac River, Activated sludge, Ecology, Environmental effects, Water quality, Microorganisms, Sewage sludge, Toxins, Protozoa, Water pollution sources, Microbiology, Estuarine environment, Oxidation, Pilot plants, Dissolved oxygen.

Two model rivers, representing Potomac River sites at Hains Point, Blue Plains Sewage Treatment Plant, Broad Creek, and Piscataway Creek connected to a common reservoir containing upriver water, were studied. Each model consisted of four 24-gallon aquaria. In one model at aquarium 2, frozen sewage was added, and in the other, dechlorinated tap water was added. Four attempts made to duplicate the May 1974 fishkill, which took place when river to sewage flow ratio was 20:1, failed: negative results were obtained with aquaria conditions representing river to sewage flow ratios of 20:1, 5:1, 1:1, and 4:4. It was concluded that the fishkill was caused by a toxin in the sewage and not a heat shock or toxin in the river. Dissolved oxygen sag curves in the river model closely approximated those at Potomac River sites at the same temperature. Other studies were done on a 50,000-gallon pilot activated sludge plant before and after hydrogen peroxide treatment of a bulking condition. A new method for counting and studying the activated sludge community was devised using thin plastic film (Handiwrap) coverslips with plastic slides. It was concluded that the protozoan community was little affected by the treatment. The oxygen-induced fragmenting of the filamentous bacteria allowed acanthamoeba to feed. Using tritiated thymidine, a food chain from bacteria to Spirostomum to the ostracod Cypridopsis was confirmed. Ecological studies are reported on the suctorian Lernaeophrya capitata and a list of protozoan and micrometazoan species cultured in the laboratory is provided. (Majtenyi-IPA)
W79-00506

NUTRIENT INPUTS AND ALGAL BLOOMS IN IOWA LAKES,
Iowa State Univ., Ames. Dept. of Animal Ecology.
R. W. Bachmann, and J. R. Jones.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 043, Price codes: A03 in paper copy, A01 in microfiche. Iowa State Water Resources Research Institute Completion Report, June 1976. 31 p, 10 fig, 3 tab, 41 ref. OWRT A-049-IA(2).

Descriptors: *Algal control, *Plankton, *Eutrophication, *Aquatic algae, *Iowa, *Lakes, Water resources, Nuisance algae, Conservation, Chlorophyll, Ecology, Phosphorus, Phosphorus compounds, Nutrients, Water quality, Nitrogen, Surveys, Evaluation.

The development of excess growth of plankton algae in Iowa lakes and reservoirs was investigated in an attempt to learn factors controlling levels of algal chlorophyll and determine if reduction of algal populations is feasible. The sampling studies showed that, in 1975, the average chlorophyll concentration was 72 mg/cu m, causing a poor water transparency with Secchi disk value of about 0.9 m. Algal levels in a sample of 143 lakes were strongly correlated with concentrations of phosphorus. Also, the ratio of nitrogen to phosphorus in Iowa lakes averages 24.2, indicating that phosphorus is most likely the limiting nutrient for algal populations. For natural lakes, summer phosphorus concentration could be calculated using the equation TP -0.84L/z (sigma + rho), where TP is the concentration of total phosphorus in the lake water (mg/cu m), L is the annual phosphorus loading per unit area of lake surface (mg/sq m), z is the mean depth of the lake (m), sigma is the sedimentation rate (year (-1)), and rho is the hydraulic flushing rate. This relationship cannot be applied to artificial lakes, seemingly because of higher sedimentation coefficients. Considering that phosphorus loading to the natural lakes is from general runoff rather than point sources, banning phosphates from detergents of phosphate removal at sewage-treatment plants will not lower phosphorus levels. Because plankton algae growth is linked with phosphorus levels, the implication is that there is not much hope of improving the character of most Iowa lakes. (Majtenyi-IPA)

PRODUCTIVITY OF OEDOGONIUM IN LAKE WINGRA, WISCONSIN,
Texas Christian Univ., Fort Worth. Dept. of Biology.
M. D. McCracken, T. D. Gustafson, and M. S. Adams.
Am Midl Nat. 92(1), p 247-254, 1974.

Descriptors: *Aerial photography, Algae, Carbon-14, Imagery, Lakes, Myriophyllum, Nutrients, *Oedogonium, *Productivity, Runoff, Sewer, Storm, Wingra(Wisc), Wisconsin, Absorption.

Productivity of the mat-forming alga Oedogonium was measured in the littoral zone of Lake Wingra, Wisconsin, for 2 seasons with a combination of techniques which included color IR imagery from aircraft, biomass harvesting and 14C uptake. Maximum productivity occurred in July, and was 32.3 mg C.day-1.m-2 lake (1972) and 2.06 g C.day-1.lm-2 algal mat (1971). Annual dry-matter production of Oedogonium in Lake Wingra was 6400 kg in 1971 and 11,500 kg in 1972. Algal mat development was related both to the presence of Myriophyllum and proximity to nutrient-rich runoff from storm-sewer entries to the lake.--Copyright 1974, Biological Abstracts, Inc.

EFFECTS OF ANTIMYCIN ON STREAM INSECTS,
Wisconsin Univ.-Madison. Dept. of Entomology.
P. M. Kotila, and W. L. Hilsenhoff.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 336, Price codes: A04 in paper copy, A01 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report WIS-WRC 78-05, 1978. 55 p, 8 fig, 10 tab, 196 ref. OWRT A-073-WIS(2), 14-34-0001-7106, 14-34-0001-8053.

Descriptors: *Fish control agents, *Piscicides, *Aquatic insects, *Invertebrates, *Toxicity, Water pollution effects, Wisconsin, Streams, Water pollution control, *Antimycin, Bioassay, *Ashippun River(Wisc).

The toxicity of antimycin to 38 species of Wisconsin stream insects was evaluated in static, aerated bioassays utilizing antimycin exposures typical of stream treatments used to kill fish. Several species of Trichoptera, Ephemeroptera and Plecoptera were very sensitive to fish killing concentrations of antimycin (EC-50 less than 50 ppb). Beetles (Psephenus herricki, Optioservus fastiditus, Stenelmis crenata, Helichus striatus, dragonfly nymphs (Neurocordulia molesta, Gomphurus vastus), damselfly nymphs (Argia apicalis), fishfly larvae (Nigronia serricornis), and snipe fly larvae (Atherix variegata) were relatively unaffected by antimycin (EC-50 greater than 1,000 ppb). Early instars of Tipula spp. and Ephemerella sp. were more sensitive to antimycin than later instars. Exposure to antimycin produced greater mortality at 19C than at lower temperatures in several species, even though exposure times were reduced at the higher temperature. Post-exposure observations indicated mortality may be delayed more than five days, particularly at reduced temperatures. Large differences in antimycin sensitivity were found for different species belonging to the same family (hydropsychid caddisflies, perlid stoneflies). Emergence of several species of stream insects was reduced or prevented by exposure of the mature larvae or nymphs to sublethal concentrations of antimycin. Pycnopsyche guttifer emerged successfully following exposure of the pupae to an antimycin concentration just below that which killed the larvae.

SOME ASPECTS OF REDOX TRENDS IN THE BOTTOM MUDS OF A MESOTROPHIC BAYOU ESTUARY,
University of West Florida, Pensacola. Dept. of Biology.
G. A. Moshiri, and W. G. Crumpton.
Hydrobiologia, Vol. 57, No. 2, p 155-158, 1978. 2 fig, 7 ref. OWRT B-024-FLA(3), 14-31-0001-5065.

Descriptors: Sediments, Estuaries, *Oxidation-reduction potential, Mesotrophy, Muds, *Florida, Bayou Texas(Fla), Hydrogen ion concentration, Temperature, Salinity, Bacteria, Organic matter.

Redox profiles, pH, bacterial numbers, and organic content of sediments in Bayou, Texar, Pensacola, Florida, were examined in an effort to delineate spatial and temporal patterns. These data were accompanied by field determinations of dissolved oxygen, pH, temperature, and salinity. The results point to the importance of bacterial activity and bottom water dissolved oxygen upon the redox status of the sediments. It is suggested that, in certain systems, the redox status of deeper sediments may reveal long-term trends which are obscured at the sediment-water interface by transient effects. (Morgan-Florida)

MINERAL CYCLING IN SALT MARSH-ESTUARINE ECOSYSTEMS; ECOSYSTEM STRUCTURE, FUNCTION, AND GENERAL COMPARTMENTAL MODEL DESCRIBING MINERAL CYCLES,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
D. Gunnison.
Available from National Technical Information Service, Springfield, VA 22161 as AD-A052 737 as Price codes: A07 in paper copy, A01 in microfiche. Technical Report D-78-3, January 1978. 150 p, 24 tab, 3 fig, 260 ref, append.

Descriptors: *Heavy metals, *Salt marshes, *Estuarine environment, Ecosystems, *Cycling nutrients, *Dredged material, *Mineral cycling, Model studies.

A nutrient and heavy metal cycling study of marsh-estuarine ecosystems was undertaken for the Dredged Material Research Program. The objective was to gather as much information as possible on mineral cycling in marsh-estuarine ecosystems. A compartmental model outlining pathway of mineral cycling within the marsh-estuarine ecosystem was developed. Approaches used in the study included literature surveys and discussions with authorities in marsh-estuarine ecology. Information from allied fields of research was used to supplement direct sources of information. Chemical release of contaminants from dredged materials may cause problems. Oxygen demands exerted by reduced materials placed in aerobic waters can deplete oxygen. Several heavy metals have increased mobility once their binding sulfides have been oxidized. Oxidation of heavily contaminated marsh soils can cause metal toxicity for plants and cat clay formation. Eutrophication resulting from use of contaminated materials for marsh creation is not a problem, except in unproductive estuaries. Present knowledge is inadequate to permit accurate predictions of environmental impacts resulting from use of heavily contaminated materials in marsh creation. Only those dredged materials containing nutrients and heavy metals in quantities no greater than those in marsh soils at the creation site should be used for marsh development.
W79-00539

AN ASSESSMENT OF THE POTENTIAL IMPACT OF DREDGED MATERIAL DISPOSAL IN THE OPEN OCEAN,
Terco Corp., College Station, TX.
W. E. Pequegnat, D. D. Smith, R. M. Darnell, B. J. Presley, and R. O. Reid.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A053 183, Price codes: A99 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-2, January 1978. 645 p, 41 tab, 85 fig, 2 append.

Descriptors: *Oceans, *Environmental effects, Water pollution effects, *Dredged material disposal, *Ocean waste disposal.

Discusses factors which indicate deep ocean disposal of dredged material may need to be utilized more extensively in the future. Evaluates the potential physical, chemical, and biological impacts that may occur from dredged material disposal in the deep ocean at and beyond the outer edge of the continental shelves of the United States and its possessions. Selects and describes oceanic areas (not sites) off eleven sectors of U.S. coasts where officials may select disposal sites. Section A discusses Deep Ocean Disposal Perspectives, and Section B covers Deep Ocean Disposal Environmental Considerations. Parts of Section A are (1) basis and objectives of study with overall evaluation of the need for and impacts of deep ocean disposal of dredged material; (2) discussion of dredging-disposal process and nature of dredged material; and (3) designation of favorable and poor deep ocean areas for dredged material disposal, and criteria for selection. Section B is devoted to (1) discussion of the workings of marine ecological systems, (2) essential oceanographic conditions off coasts of all geographic sectors of the United States and its possessions, and (3) analysis of the fate and potential impact of dredged material disposed in the deep ocean. ZOOPLANKTON STANDING CROPS IN THE DISCHARGE OF LAKE FRANCIS CASE, 1966-1972,
Fish and Wildlife Service, Yankton, SD.
D. B. Martin, and J. F. Novotny.
The American Midland Naturalist, Vol. 98, No. 2, October 1977, p 296-307. 4 fig, 4 tab, 7 ref.

Descriptors: *Zooplankton, *Lake Francis Case(SD), *Standing crops, *Reservoir releases, *Seasonal, *Reservoirs, Cyclops bicuspidatus thomasi, Diaptomus, Daphnia pulex, Daphnia galeata mendotae, Species composition, Faunal lists, Lakes, Missouri River, South Dakota, Nutrients, Organic matter.

Zooplankton standing crops in the discharge of Lake Francis Case, a Missouri River reservoir near Lake Andes, South Dakota, were monitored 1966-72 with an automatic plankton sampler. Standing crops of the three major taxa--Cyclops, Diaptomus, and Daphnia--fluctuated predictably, but causes of the fluctuations could not be determined. An important long-run decline in total zooplankton abundance was evident: during 1966-69 average total zooplankton standing crop ranged from 14.0-19.8/liter, while during 1970-72 average total standing crop varied from 5.7-8.7/liter. The reduction was due to a significant decline in Cyclops abundance, without an equivalent increase in Diaptomus or Daphnia abundance. Cyclops, the most abundant taxon during the study, had a strongly bimodal annual distribution with maxima in late spring and early winter. Diaptomus, next most abundant, was unimodal annually, with its maximum from early spring to midsummer. The annual cycle of Daphnia, the only other frequently encountered taxon, was weakly bimodal, with primary maximum in late spring and a secondary maximum in early winter. The decline in zooplankton standing crop does not appear to be caused by fish predation or water management practices. Zooplankton population may have been affected by a probable decline in export of nutrients, organic matter, and zooplankton from the new upstream reservoir, Lake Oahe, which reached operational level in 1969. DETRITUS IN THE LAKE ECOSYSTEM,
Connecticut Univ., Storrs. Biological Sciences Group.
P. H. Rich, and R. G. Wetzel.
The American Naturalist, Vol. 112, No. 983, January 1978, p 57-71. 5 fig, 1 tab, 53 ref. ERDA C00-1599-75 and NSF GB-6538, GB-28900X, GI-20.

Descriptors: *Detritus, *Lakes, *Ecosystems, *Carbon, *Energy transfer, Lake Lawrence(MI), Michigan, Ecology, Metabolism, Herbivores, Oxidation-reduction potential, Sediments, Trophic level, Food chains, Benthos, Respiration, Anaerobic conditions, Bacteria.

Present views of the role of detritus in lakes are inconsistent with the ecosystem concept, and underestimate the importance of carbon and energy pathways involving detritus. Nonpredatory losses from a plant-herbivore transfer, particularly in the form of dissolved organic matter and egestion, may be greater than the amount of material and energy transmitted up the grazer food chain. Ecosystem efficiencies are significantly higher than Lindeman (food chain) efficiencies. Benthic anaerobic metabolism (carbon dioxide production) is greater than benthic oxygen uptake estimates indicate; energy-rich intermediate products which undergo deferred respiration (O2 uptake) far from their origin may create oxidation-reduction gradients, drive chemosynthesis, and subsidize bacterial photosynthesis in the water column. Particulate and dissolved aquatic detrital material and its metabolism thus create a dynamic structure in lake sediments and water somewhat analogous to the trophic-dynamic aspect of the biota. Detrital-dynamic structure in lakes is not, however, simply an alternative mode of support for biota, but a major factor in entrainment of abiotic substances which subsidizes the biota. This reevaluation of the role of detritus resulted from a metabolism study in Lake Lawrence, Michigan. Topics covered include: (1) nonpredatory loss, (2) anaerobic respiration, (3) implications of benthic detrital electron flux, and (4) role of detritus. (Lynch-Wisconsin)

DEPENDENCE OF OXYGEN EVOLUTION AND UPTAKE BY CHLORELLA UPON THE NATURE OF LIGHT FIELD DISTRIBUTION IN THE SUSPENSION,
Akademiya Nauk SSSR, Pushchino. Inst. of Biological Physics.
A. B. Brandt, M. I. Kiseleva, and G. Z. Finakov.
Soviet Plant Physiology, Vol. 23, No. 4, July 1976, p 596-600. Translated from Fiziologiya Rastenii, Vol. 23, No. 4, July-August 1976, p 710-714. 3 fig, 2 tab, 26 ref.

Descriptors: *Chlorella pyrenoidosa, *Light, *Oxygen, *Photosynthesis, *Suspension, *Polarographic analysis, Absorption, Algae, Cultures, Respiration, Density, Gas exchange, Metabolism, Energy.

Polarography was used to investigate rates of oxygen evolution (photosynthesis) and uptake (respiration) as a function of density of a Chlorella pyrenoidosa suspension, and distribution of the light field in the polarographic cell. Results indicate a promising outlook for the proposed polarographic method and cell design in studying gas exchange of unicellular autotrophic algae. At wholly equal absorption of impinging radiation by the Chlorella suspension, the specific energetic photosynthetic activity of cells in the suspension was practically the same. Specific photosynthetic activity of the cells increased significantly with decrease of suspension density and assurance of sufficient illumination of cells in all layers of the polarographic cell. Even such a high PAR irradiance as 622 W/sq m is therefore not photosynthesis-saturating in Chlorella. The respiration rate of Chlorella cells depended upon conditions of their preliminary illumination. Cell respiration activity increased with light and with increases in the specific efficiency of photosynthesis; this relationship is attributable not only to direct light stimulation of metabolic processes, but also to greater accumulation of primary photosynthetic products at high specific photosynthesis with good illumination, leading to greater energy expenditure for secondary conversions. The polarographic cell consisted of a plexiglas chamber with a volume of 20 cu cm. (Lynch-Wisconsin)

FOOD SIZE SELECTION AND SEASONAL SUCCESSION OF FILTER FEEDING ZOOPLANKTON IN AN EUTROPHIC LAKE,
Warsaw Univ. (Poland). Dept. of Hydrobiology.
Z. M. Gliwicz.
Ekologia Polska, Vol. 25, No. 2, 1977, p 179-225. 12 fig, 3 tab, 83 ref.

Descriptors: *Zooplankton, *Filter feeders, *Eutrophication, *Mikolajskie Lake(Poland), *Succession, *Food habits, *Seasonal, Particle size, Size, Lakes, Poland, Crustaceans, Algae,

Filamentous algae, Limiting factors, Grazing, Phytoplankton, Daphnia cucullata, Daphnia longispina, Bosmina coregoni, Eudiaptomus graciloides, Diaphanosoma brachyurum, Chydorus sphaericus, Net phytoplankton.

Data on seasonal changes in zooplankton and phytoplankton in eutrophic Mikolajskie Lake, Poland, were used to assess effects of small (edible) and large (inedible) algae on succession of plankton crustaceans, and upon the demography of planktonic filter feeders. Results showed that filtering rate, feeding rate, fecundity, and abundance of some species (group 1 below) are more strongly limited by available food concentration, while in other species (group 2) these characteristics are limited by high concentrations of large, filamentous algae. The former group are distinguished by a smaller upper size limit of particles grazed (and a narrower gap between carapace margins in cladocerans), and the latter by a greater upper size limitk and therefore by greater susceptibility to filtration interference by net phytoplankton. In Mikolajskie Lake the following seasonal succession of the two groups occurs: (1) spring increase of group 1--Daphnia cucullata, D. longispina, Bosmina coregoni, and Eudiaptomus graciloides, peaking in June; (2) summer decline of this population, coinciding with an increase in group 2--Diaphanosoma brachyurum and Chydorus sphaerieus; and (3) autumn return of the first population with decline of the second. Net phytoplankton concentration seems to have a greater limiting influence on competitively stronger species, permitting the appearance and persistence of competitively weaker species. ZONATION OF MARINE GASTROPODS ON A ROCKY INTERTIDAL SHORE IN THE ADMIRALTY GULF, WESTERN AUSTRALIA, WITH EMPHASIS ON THE GENUS NERITA,
Western Australian Museum, Perth.
F. E. Wells.
The Veliger, Vol. 20, No. 3, January 1977, p 279-287. 3 fig, 2 tab, 18 ref.

Descriptors: *Nerita reticulata, *Gastropods, *Shores, *Admiralty Gulf(Australia), *Zonation, *Species diversity, Species composition, Walsh Point(Australia), Australia, Snails, Nerita undata, Nerita polita, Mollusks, Habitats, Tidal effects, Gulfs, Littoral, Rocks.

Zonation of marine gastropods on the rocky intertidal shore of Walsh Point, Admiralty Gulf, western Australia, studied in fall 1976, showed highest diversity in middle areas, tapering off toward both higher and lower portions of the shore. Although it would be expected that diversity would be highest in the lower intertidal area covered by seawater for the longest periods, the beach structure at Walsh Point provides an explanation. Rocks of the mid-tide region are large and close together, thus providing abundant and stable crevices for snails to retreat into during low tide; in the lower portion of the zone rocks are spaced about 30 cm apart, precluding such refuges. A total of 3375 individuals belonging to 18 gastropod species were collected for this study, although a broader survey of mollusks in the gulf indicates at least 75 species of gastropods occur at Walsh Point. Two species of Nerita were overwhelmingly dominant, with N. reticulata accounting for 38.9% of all specimens and N. undata 32.3%; a third species, N. polita, accounted for 1.8%. N. polita was mostly located away from the other two, being an upper intertidal species. The index of overlap between N. polita and N. reticulata was only 0.07, while between N. polita and N. undata, which occupies the intermediate position on the shore, the overlap was much higher, 0.29. Overlap between N. undata and N. reticulata was substantial, although there was some segregation. (Lynch-Wisconsin)

AN APPROACH TO QUANTITATIVE NUTRITION OF PHYTOPLANKTON,
Scottish Marine Biological Association, Oban.
M. R. Droop.
The Journal of Protozoology, Vol. 24, No. 4, November 1977, p 528-532. 2 fig, 1 tab, 25 ref.

Descriptors: *Phytoplankton, *Mathematical models, *Nutrients, *Plant growth, *Substrates, Algae, Model studies, Vitamins, Ecology, Biomass, Monod model, Limiting factors.

A two-compartment model of phytoplankton growth in relation to nutrients is able simultaneously to handle multiple nutrients and organisms in an environment of changing inputs and outputs. The simple one-compartment Monod model for substrate-limited growth is discussed, which requires cells to be in equilibrium with their surroundings. But including conservative substrates--those not required--complicates the analysis. Chemical composition of cells is sensitive to environmental conditions, including the specific growth rate itself. Since the compounds under investigation were never the controlling substrate, there is nothing to suggest they might still vary with growth rate had they been in control. In 1968 the correlative suggestion was made that growth rate was related to internal substrate level rather than vice-versa. Subsequent work unequivocally demonstrated the interdependence of specific growth rate and internal concentrations of these limiting nutrients. Growth rate was apparently controlled by the level of the internal pool. The two-compartment model represents a modification of the Monod model to incorporate these developments. An example of the model's performance in a batch culture is given. It is noted that for such models to be of real value to ecologists the community as a whole must be modelled. (Lynch-Wisconsin)

BIOLOGICAL INTERACTIONS AND THE REALIZED NICHE OF EUPLOTES VANNUS FROM THE SALT MARSH AUFWUCHS,
New York Inst. of Tech., Old Westbury. Dept. of Life Sciences.
W. A. Muller, and J. J. Lee.
The Journal of Protozoology, Vol. 24, No. 4, November 1977, p 523-527. 5 fig, 1 tab, 34 ref.

Descriptors: *Euplotes vannus, *Niches, *Allogromia laticollaris, *Chromadorina germanica, *Ecology, *Competition, Salt marshes, New York, Littoral, Ecosystems, Ciliates, Biological communities, Herbivores, Food habits, Limiting factors, Nutrients, Hydrogen ion concentration, Protozoa, Periphyton, Eutrophication, Algae.

Biological interactions of the hypotrich ciliate protozoan Euplotes vannus with two other herbivores, the foraminiferan Allogromia laticollaris, and the nematode Chromadorina germanica were studied in nutrient limiting and nutrient non-limiting situations. E. vannus is a member of diverse communities of microorganisms, small algae, and small animals, functionally interwoven in time and space, which help transform macrophyte structural materials into compounds usuable by larger carnivorous and omnivorous animals. E. vannus, which grows well over broad ranges of temperature and salinity, requires higher densities of food (>10,000 cells/ml) for rapid reproduction than do A. laticollaris (>100 cells/ml) and C. germanica (1000 cells/ml or less). With initially high food levels (about one million cells/ml) the ciliates reproduced rapidly and consumed algae faster than it could reproduce. Some balance between algae and ciliates was achieved at initial algal concentrations of about 100,000 cells/ml. With equal numbers of the three species studied in microcosm experiments at 25C, E. vannus competed very poorly, reaching only 20% of control levels when grown with C. germanica and 13% when cultured with A. laticollaris. It competed better in two-species microcosms when temperatures were lower and when its ratio to the other species was initially higher. Organisms were originally isolated from North Sea Harbor, Long Island, New York. (Lynch-Wisconsin)

ENZYMATIC RELEASE OF PHOSPHATE IN WATER FROM SUBARCTIC LAKES IN NORTHERN SWEDEN,
Uppsala Univ. (Sweden). Inst. of Limnology.
M. Jannson.
Hydrobiologia, Vol. 56, No. 2, p 175-180. 3 fig, 1 tab, 18 ref.

Descriptors: *Enzymes, *Phosphates, *Phosphatases, *Seston, *Particulates, *Plankton, *Degradation(Decomposition), Sweden, Lakes, Subarctic, Nutrients, Tracers, Phosphorus, Hydrolysis, Lake Stugsjon(Sweden), Lake Hymenjaure(Sweden), Lake Magnusjaure(Sweden), Filtration, Eutrophication, Chromatography.

In a study of phosphatase activity and phosphate regeneration in three small subarctic lakes in northern Sweden, considerable amounts of phosphate from autoclaved water were released by phosphatases. Particulate matter was also demonstrated to be an important source of phosphorus to planktonic organisms, and a possible substrate for phosphate-releasing enzymes. Exposure of autoclaved 32phosphorus-labelled plankton to lake enzymes, followed by characterization of degradation products with gel chromatography, showed that phosphate was enzymatically released from particulate matter. That seston is a vitally important phosphorus source for plankton was indicated by high phosphatase activity resulting from inoculation of seston-free lake water with plankton. Three experiments were conducted during this study: (1) addition to unfiltered autoclaved lake water of a concentrate of lake enzymes prepared by ultrafiltration; (2) inoculation of plankton into different filtrates of lake water; and (3) addition of an enzyme concentrate to autoclaved 32phosphorus-labelled seston in autoclaved nonradioactive lake water. The lakes studied were Lake Stugsjon, Lake Hymenjaure, and Lake Magnusjaure. Lake Stugsjon is oligotrophic, with a total phosphorus concentration of about seven micrograms/liter and total nitrogen of about 200 micrograms/liter. The other two lakes are changing from oligotrophy to increasing eutrophication due to artificial phosphorus and nitrogen enrichment. (Lynch-Wisconsin)

THE OCCURRENCE OF INTERNAL PHOSPHORUS LOADING IN TWO SMALL,

EUTROPHIC GLACIAL LAKES IN NORTHEASTERN OHIO,
Kent State Univ., OH. Dept. of Biological Sciences.
G. D. Cooke, M. R. McComas, D. W. Waller, and R. H. Kennedy.
Hydrobiologia, Vol. 56, No. 2, 1977, p 129-135. 2 fig, 2 tab, 23 ref. EPA R-80193605.

Descriptors: *Eutrophication, *Twin Lakes(OH), *Nutrient budget, *Phosphorus, *Internal loading, *Water pollution sources, Lake restoration, Water pollution control, Ohio, Lakes, Glacial lakes, Nutrients, Sediments, Macrophytes, Sediment-water interfaces.

Nutrient budgets for the small, eutrophic Twin Lakes of northeastern Ohio during the summers of 1972-74 indicate that 65-100% of the summer increase in phosphorus content in the water is due to internal loading. Internal loading appears to delay recovery of each lakes following nutrient diversion, and chemical inactivation of phosphorus with aluminum hydroxide may be necessary. Water samples were collected in East and West Twin Lakes and in three inflowing streams, and analyzed for total phosphate-phosphorus; water temperature was also monitored. Possible loading sources: (1) Phosphorus release from anoxic sediments, (2) seston sedimentation, (3) groundwater income, (4) wind stress causing transfer of nutrient-rich hypolimnetic water to the epilimnion, (5) macrophyte transport of phosphorus from sediment to water, and (6) epiphyte excretion. Results of this study conflict with previous studies of the experimental Canadian Shield lakes, possibly due to the latter not having large nutrient reservoirs in the sediments as are found in naturally eutrophic lakes. The Twin Lakes are kettle-type lakes receiving upland drainage, urban runoff, and, until 1972, septic tank discharge; there is no agricultural drainage. The lakes thermally stratify by mid- to late April and remain stratified until mid-November. Macrophyte growth is extensive, covering 25% of the lake area. (Lynch-Wisconsin)

STRUCTURAL CHARACTERISTICS OF A DIATOM COMMUNITY EPIPHYTIC ON RUPPIA MARITIMA,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Entomology and Economic Zoology.
M. J. Sullivan.
Hydrobiologia, Vol. 53, No. 1, 1977, p 81-86. 1 fig, 5 tab, 11 ref.

Descriptors: *Ruppia maritima, *Diatoms, *Epiphytes, *Great Bay salt marsh(NJ), *Species diversity, *Biological communities, Algae, Salt marshes, New Jersey, Navicula pavillardi, Spartina alterniflora, Widgeon grass, Marsh plants, Floral lists, Diversity indices, Shannon-Wiener index, Similarity, Analytical techniques.

A study of structural characteristics of the epiphytic diatom community on widgeon grass (Ruppia maritima) in New Jersey's Great Bay salt marsh (May-September 1975) showed high community diversity during initial R. maritima growth, followed by sustained low levels after host vegetative growth had ceased and no new attachment sites were available. Although 57 diatom taxa were identified, Navicula pavillardi, the dominant taxon, accounted for one-third of all individuals collected. Leaves and internodes of R. maritima support a single, nearly homogeneous epiphytic diatom community; differences between leaves and internodes are minimal, according to analysis of variance and to Stander's similarity index. Marsh sediments are the major source of individuals for Ruppia colonization, as indicated by comparing the epiphytic diatom community with diatoms inhabiting the marsh proper. The salt marsh is dominated by dwarf Spartina alterniflora; two pools known to support luxuriant Ruppia growth were sampled monthly for the study. After taxonomic analysis, species diversity (H') was calculated using the Shannon-Wiener informational index. Species diversity, number of diatom taxa in a given sample, and relative abundance of 12 abundant taxa were subjected to two-way analysis of variance (date x site). (Lynch-Wisconsin)

NUTRIENT LIMITATION OF PHYTOPLANKTON IN A CENTRAL ARIZONA RESERVOIR,
Arizona State Univ., Dept. of Botany and Microbiology.
N. L. Crane, and M. R. Sommerfeld.
Hydrobiologia, Vol. 51, No. 3, 1976, p 219-224. 4 fig, 2 tab, 29 ref.

Descriptors: *Limiting factors, *Phytoplankton, *Lynx Lake(AZ), *Nitrogen, *Phosphorus, *Carbon, Nutrients, Arizona, Reservoirs, Lakes, Algae, Chlorophyll, Hydrogen ion concentration, Dissolved oxygen, Species composition, Chlorella, Scenedesmus, Cosmarium, Standing crops, Biomass.

Additions of nutrients (nitrogen, phosphorus, and carbon) individually and in combinations to eight polyethylene bags partially submerged in Lynx Lake, near Prescott, Arizona, a reservoir characterized by low nitrogen and phosphorus levels and a sparse, nondiverse phytoplankton population, showed that only nitrogen and phosphorus together limited the phytoplankton. Large increases in phytoplankton numbers, extractable chlorophyll, pH, and dissolved oxygen occurred only in bags to which either nitrogen-phosphorus, or nitrogen-phosphorus-carbon were added, but not in bags with nutrients added individually or in other combinations. Maximum populations were obtained on the tenth day after nutrient addition, and were two to three times that of the control. Little alteration in species composition was observed. Chlorella sp. dominated, with Scenedesmus sp. and Cosmarium sp. also prevalent. The diatoms Epithemia sorex, Rhodopalia gibba, Synedra tabulata, and Synedra ulna were present in small numbers. Nutrient concentrations are low throughout the year in the lake, with less than 0.01 mg/liter orthophosphate-phosphorus and 0.02 mg/liter nitrate-nitrogen. The polyethylene bags, 43 cm in diameter and 1.0 m in length, were submerged to within 15 cm of the top, and kept afloat by wooden frames. Nutrients were added as solutions of the salts NaHCO3, NaNO3, and Na2HPO4. (Lynch-Wisconsin)

AMMONIA-NITROGEN EXCRETION IN DAPHNIA PULEX,
North Dakota State Univ., Fargo. Dept. of Zoology.
T. R. Jacobsen, and G. W. Comita.
Hydrobiologia, Vol. 51, No. 3, 1976, p 195-200. 4 fig, 14 ref.

Descriptors: *Daphnia pulex, *Ammonia, *Nitrogen, *Excretion, *Water temperature, *Weight, Eutrophication, Phytoplankton, Algae, Silver Lake(MN), Minnesota, Lakes, Chlamydomonas reinhardi, Zooplankton, Energy budget, Proteins, Amino acids.

Ammonia-nitrogen excretion rates of the zooplankter Daphnia pulex in natural summer and cultured populations (from Silver Lake, Clay County, Minnesota) appear partially dependent on temperature and dry body weight, but are probably also affected by food concentration and physiological/environmental influences. An inverse relationship between ammonia-nitrogen excretion and phytoplankton blooms is likely. Ammonia-nitrogen excretion dropped from 0.26-28 micrograms N/animal/day before and after the first bloom in late June (1973) to 0.1 micrograms during the second and third blooms in late July and late September, then increased to 0.145 micrograms. Temperature during the three blooms was 20, 25, and 15C. indicating ammonia-nitrogen excretion may be more dependent on factors other than temperature. One explanation for the excretion rate decrease during blooms may be utilization of proteins and amino acids as secondary energy sources. The mean ammonia-nitrogen excretion rate for the summer population was 0.2 micrograms N/animal/day, or 5.11 micrograms N/mg dry body wt/day (N=80) measured at 15, 20, and 25C. Excretion rates of D. pulex cultured on Chlamydomonas reinhardi yielded the temperature relationship Log10E=(0.061) T 1.773, where E is micrograms N/animal/day and T is temperature. Excretion on a mg dry body wt/day basis was related to temperature as Log10E=(0.043) T + 0.153, where E is micrograms N/mg dry body wt/day. (Lynch-Wisconsin)

SPECIES DENSITIES OF MACROBENTHOS ASSOCIATED WITH SEAGRASS: A FIELD EXPERIMENTAL STUDY OF PREDATION,
Smithsonian Institution, Fort Pierce, FL.
D. K. Young, M. A. Buzas, and M. W. Young.
Journal of Marine Research, Vol. 34, No. 4, 1976, p 577-592. 2 fig, 6 tab, 44 ref, 1 append.

Descriptors: *Density, *Seagrass, *Predation, *Benthic fauna, *Invertebrates, *Indian River estuary(FL), *Food webs, Ecosystems, Fish, Crustaceans, Decapods, Halodule wrightii, Florida, Estuaries, Rivers, Faunal lists, Carnivores, Deposit feeders, Cages, Food habits, Macrofauna.

Predator exclusion cages were monitored October 1974-Febrary 1975 at three sites in the Indian River estuary, east-central Florida, to determine the effects of the cages on benthic invertebrates larger than one mm associated with the seagrass Halodule (=Diplathera) wrightii. At two sites (Haulover Canal and Link Port) the expected increase in species density occurred, while at the third, St. Lucie, Species density decreased, due probably to predation from carnivorous decapod crustaceans found in larger numbers at this site. The decapods were protected from fish predation by the cage. Multivariate analysis of variance with interaction, used to assess densities of 33 numerically dominant macrofaunal species at the three sites, demonstrated previously unrecognized differences in caging effects. The overall time hypothesis of the model was significant at all sites, but the time of experiment initiation may determine effects of a particular cage, as evidenced by the fact that the same species did not attain maximum densities simultaneously. Thirty-two of the dominant species were grouped as r-strategists (or opportunists, whose densities were strongly regulated by predation as well as by undetermined chance events. Because of their food web interrelationships, decapod predation probably increases the efficiency of fish consumption of seagrass-associated mcrofauna. Dominant species included 17 deposit feeders, seven suspension feeders, six carnivores, and three herbivores-scavengers. (Lynch-Wisconsin)

TRANSPORT LIMITED NUTRIENT UPTAKE RATES IN DITYLUM BRIGHTWELLII,
Johns Hopkins Univ., Baltimore, MD. Dept. of Geography and Environmental Engineering.
W. J. Pasciak, and J. Gavis.
Limnology and Oceanography, Vol.20, No. 4, July 1975, p 604-617. 6 fig, 5 tab, 11 ref. NSF GA-36282.

Descriptors: *Ditylum brightwellii, *Nutrients, *Absorption, *Limiting factors, *Transport, *Phytoplankton, *Plant growth, Algae, Diffusion, Nitrates, Nitrites, Shear, Shape, Equations, Michaelis-menten relationships.

Transport limitation of nutrient rate, demonstrated experimentally for the marine unicellular diatom Ditylum brightwellii, can be presumed to occur for other species. This factor may be important for

studying phytoplankton growth under natural conditions. The present study extends to cylindrical and disk-shaped cells an earlier analysis of diffusional transport limitation of nutrient uptake rates applied to spherical cells. Data show that transport limitation of nitrate and nitrite uptake rates by the phytoplankter occurred at low concentrations in still media, and that when the organism was placed in a sufficiently high shear field, transport limitation was overcome; transport limitation also disappeared at high nutrient concentration, and limitation effect was decreased by mixing. D. brightwellii was chosen for the experiments because it could show transport-limited uptake at low nutrient concentrations, is easily cultured, and because its nitrate and nitrite uptake rates have been extensively studies. Culture medium was half seawater and half 2.5% sodium chloride solution, supplemented by trace metals and vitamins, and all tests were conducted at 18-20 C. In most experiments nitrate was the limiting nutrient. In the shear field experiments, conducted in special apparatus (described), the rate of shear was kept temporally and spatially constant. Uptake rates could be directly compared for still ad moving cells. (Lynch Wisconsin)

LIGHT RESPONSES OF DAPHNIA PULEX,
Wisconsin Univ.-Madison. Lab. of Limnology.
S. C. Stearns.
Limnology and Oceanography, Vol. 20, No. 4, July 1975, p 564-570. 3 fig, 3 tab, 19 ref.

Descriptors: *Daphnia pulex, *Light, *Color, *Wavelengths, *Diel migration, *Food habits, Biorhythms, Zooplankton, Cladocera, Grazing, Phytoplankton, Algae, Diurnal.

The cladoceran Daphnia pulex was tested for activity responses to different wavelengths of light at constant intensity, and in white light at fixed intensity. Purposes were to (1) check Smith and Baylor's conclusions that daphnids respond to color changes, (2) assess reliability of ambient light color as a guide for zooplankton grazers in locating food (algae) as postulated by Smith and Baylor, and (3) learn if daphnids have a circadian response to light intensity that could bias results at different times of the day. Smith and Baylor observed that at wavelengths of incident light below 500 nm D. magna tended to roam horizontally, while at wavelengths above 600 nm they tended to stay in place through a vertical hop-and-sink motion; they proposed that such behavior would either maintain the daphnids under algae where the light may be reddish, or in clear water dominated by blue-green wavelengths impel them to seek out algae. Results of te current testing showed that: (1) Daphnids tend to move vertically between 480 (blue ad 735 (red) nm, and horizontally at 440 nm (violet) and in white light, thus corroborating Smith and Baylor's observations. (2) The color of ambient light is probably not a reliable indicator for 300 plankton in finding phytoplankton. (3) D. pulex exhibit a circadian activity rhythm, with total activity low at night, increasing to a peak in the morning, and declining through the afternoon. (Lynch-Wisconsin)
W79-00566

SESTON DYNAMICS AND TRIPTON SEDIMENTATION IN THE PELAGIC ZONE OF A SHALLOW EUTROPHIC LAKE,
Wisconsin Univ.-Madison. Lab. of Limnology.
A. Gasith.
Hydrobiologia, Vol. 51, No. 3, 1976, p 225-231. 3 fig, 2 tab, 21 ref. NSF AG-199 BMS 69-01147 A 09.

Descriptors: *Seston, *Tripton, *Sedimentation, *Organic matter, *Lake Wingra(WI), *Eutrophication, Pelagic zone, Lakes, Sediments, Phytoplankton, Zooplankton, Macrophytes, Productivity, Carbon, Wisconsin, Shallow water, Particulates, Benthic flora, Detritus, Suspended solids, Insects.

Transport of organic matter from water column to sediments in shallow eutrophic Lake Wingra (Madison, Wisconsin) was investigated, as well as the relationship between dynamics of total suspended matter (seston) and the settleable fraction (organic detritus, or tripton). Corrections were made to eliminate resuspended bottom sediments (and living components) from tripton measurements. Results show that sedimentation of tripton is closely related to seston dynamics, with a lag of two to four weeks. Tripton sedimentation rate ranged from 0 g/sq m/day in May to eight g in August. Relative to seston standing crop, maximum sedimetation rate was 8% seston/day (in September). Annual tripton sedimentation is estimated at 632 g dry wt (215 C/sq m), equivalent to 55% of annual phytoplankton production ad 42% of combined annual phytoplankton and macrophyte production. An estimated 70% of settling organic matter is decomposed annually, indicating that only a small fraction of tripton is represented in the long-term accumulation of bottom deposits. Possible factors influencing tripton sedimentation include: (1) water turbulence, (2) differences in phytoplankton associations, and (3) phytoplakton-zooplankton interactions. High orgaic content of seston and significant correlation between phytoplankton productivity and seston concentration suggest that the pelagic seston in Lake Wingra is primarily of planktonic origin. A QUANTITATIVE STUDY OF THE PHYTOPLANKTON OF THE RIVER AVON, BRISTOL,
Ankara Univ. (Turkey). Dept. of Systematic Botany.
G. Aykulu.
British Phycological Journal, Vol. 13, No. 1, March 1978, p 91-102. 3 fig, 1 tab, 6 ref.

Descriptors: *Phytoplankton, *Avon River(England), *Seasonal, *Rivers, *Species composition, Benthic flora, Benthos, England, Diatoms, Centric diatoms, Chlorophyceae, Cryptophyceae, Nutrients, Biomass, Succession, Algae, Cryptomonas.

Quatitative study (June 1972-August 1973) of the phytoplankton of the River Avon, England, shows dominance by centric diatoms, with Chlorophyceae richest in number of species, and the cryptophyte cryptomonas sp. of ten abundant. Centric diatoms increase in spring and autumn, and chlorophyceae are abundant in summer. Total phytoplankton increases downstream. Phytoplankton numbes are generally high in midspring and summer, decrease gradually toward the end of autumn, and are low in winter. Nutrients apparently do not limit algal growth in the river. Phytoplankton of the River Avon are very similar in species cmposition to those of the rivers Lee, Stour, Kennet, Thames, and Severn; this suggests a common planktonic flora dominated by small centric diatoms (Stephanodiscus, Cyclotella, and Thalassiosira), with a fairly regular occurrence of the pennate Nitzschia acicularis, and subsidiary roles for flagellate and cooccoid Chlorophyta. Although species are fewer in number and less varied in the rivers than in lakes, there are similarities with eutrophic lake plankton. True river plankton definitely exist, and are not merely derived from the benthos; they are instead species which only reproduce rapidly when suspended in the water, but are able to maintain themselves while sedimented and entangled in the debris of the benthos. TRANSLOCATION OF PHOTOASSIMILATED 14C IN THE RED ALGA POLYSIPHONIA LANOSA,
Leeds Univ. (England). Dept. of Plant Sciences.
C. H. C. Turner, and L. V. Evans.
British Phycological Journal, Vol. 13, No. 1, March 1978, p 51-55. 1 fig, 1 tab, 6 ref.

Descriptors: *Polysiphonia lanosa, *Carbon radioisotopes, *Rhodophyta, *Photoassimilates, *Ascophyllum nodosum, *Translocation, *Plant physiology, *Reproduction, Epiphytes, Algae, Photosynthesis, Darkness, Procarps, Carbospores, Metabolites, Metabolism, Respiration, Spores.

Procarps (the female organ of red seaweed) of the epiphytic red alga Polysiphnia lanosa continued to accumulate carbon-14 in the dark and in the absence of external radioactivity, following photosynthetic carbon-14 assimilation. Accumulation is shown to be derived from photoassimilates originating in the gametophytic tissue supporting the procarp. Results thus establish that translocation of photoassimilates occurs within p. lanosa, and that an effective distribution of any metabolites derived from its host plant, Ascophylum nodosum, could occur withing the epiphyte. The ultimate goal of this research is to determine if directional translocation of assimilate occurs between ascopyllum nosdusum and its epiphyte P. lanosa. Sporulating tissue was used in the experimets, where significant assimilate movement might be expected. Sterily P. lanosa plants and female plants bearing a procarps were collected at Culler-coats in northeast England in September. Although movement of metabolites through intct pit connections is unlikely, and no other from of intercellular connection has been found, substances must move between red algal cells. During such periods as cystocarp development, pit connections break down and disappear, undoubtedly assisting in bulk translocation of photoassimilates which apparently occurs at that time. Rhodophyte growth and development may therefore be controlled to some degree by seasonal and perhaps selective breakdown of pit connections. (Lynch-Wisconsin)

CHANGES IN CARBON AND NITROGEN CONTENT DURING DECOMPOSITION OF THREE MACROPHYTES IN FRESHWATER AND MARINE ENVIRONMENTS,
Oakland Univ., Rochester, MI. Dept. of Biological Sciences.
R. D. Hunter.
Hydrobiologia, Vol. 51, No. 2, 1976, p 119-128. 4 fig, 2 tab, 31 ref.

Descriptors: *Carbon, *Nitrogen, *Degradation(Decomposition), *Chara contraria, *Lemna minor, *Fucus vesiculosus, Macrophytes, Ash, Salt marshes, Shores, Ponds, Swamps, Aquatic plants, Detritus, Food chains, Duckweed, Organic matter.

In an effor to study in-situ changes in quantity and quality of dead plant material in small lentic freshwater and rocky shore marine environments, ash, organic carbon, and total nitrogen content were determined for the aquatic macrophytes Chara contraria, Lemna minor, and Fucus vesiculosus, both fresh and after decomposition, in both kinds of habitat. Chara was studied in a small freshwater pond and Lemna in a shallow swamp over 70 days of in-situ decomposition, and Fucus was examined over a 63-day period in a rocky shore area and in a salt marsh. Chara showed a progressive decrease in carbon and an increase in nitrogen, while Lemna increased in carbon and decreased in nitrogen (ash-free dry weight). Although the Chara carbon:nitrogen ratio was initially high and that of Lemna relatively low, C:N after decomposition was nearly the same for both. In the salt marsh, Fucus decomposition produced no significant change in carbon, but an increase in nitrogen. On the rocky shore, decompostion decreased carbon and increased nitrogen. Much of the initial total dry weight loss during submergence is attributable to solubilization of ash and of some high C:N ratio organic material. Accumulation of a high proportion of autotrophic microbial biomass (such as purple sulfur bacteria) in the structural carbohydrates of the salt marsh Fucus may have caused observed

differences in C:N of the decomposing Fucus. Data suggest that initial differences in nutritional value of aquatic macrophytes diminish during decompostion, and the ultimate C:N may be more dependent on decomposer organisms than on type of organic material. (Lunch Wisconsin)

EFFECT OF THE CONCENTRATION OF NITROGEN COMPOUNDS ON MICROBIAL REDUCTION OF SULPHATES,
Adam Mickiewicz Univ., Poznan (Poland). Inst. of Chemistry.
F. Domka, and J. Sasiorek.
Acta Microbiolgica Polonica, Vol. 7, No. 4, 1975, p 259-262. 3 fig, 1 tab, 6 ref.

Descriptors: *Sulfates, *Reduction(Chemical), *Desulfovibrio desulphuricans, *Microorganisms, *Nitrogen, *Sulfur, Nitrogen-sulfur ratio, Sulfides, Carbon.

In tests of microbial sulfate reduction by Desulfovibrio desulphuricans, a change in the nitrogen:sulfur ratio in the reaction medium affected the degree of reduction of sulfates to sulfides. In previous investigations of such reduction by the present authors, effects of temperature, pH and carbon:sulfur ratio had been studies. Optimal reduction conditions were at an N:S ratio of 0.33. The time interval between the initial and log phase of the process was also dependent on the N:S ratio. Five media closely resembling Starkey's medium with varying N:S ratios (mg/20 ml) of 0.19, 0.33, 0.48, 0.63, and 1.22 were used in the experiments. All experiments were conducted at 33 C in Polezajev bottles; pH was maintained at 6.8. The carbon:sulfur ratio was held constant at 1.84, determined in a previous study to be optimal. Results indicate that for microbial reduction of sulfates to sulfides on an industrial scale, an adequate supply of utilizable nitrogen is required to assure optimal reduction conditions. A MODEL OF RENEWABLE RESOURCES AND LIMITATION OF DEPOSIT-FEEDING BENTHIC POPULATIONS,
State Univ. of New York at Stony Brook. Dept. of Ecology and Evolution.
J. S. Levinton, and G. R. Lopez.
Oecologia, Vol. 31, No. 2, 1977, p 177-190. 6 fig, 1 tab, 32 ref.

Descriptors: *Hydrobia minuta, *Mathematical models, *Deposit feeders, *Limiting factors, *Renewable resources, *Fecal pellets, *Benthic fauna, Hydrobia ventrosa, Snails, Gastropods, Equilibrium, Model studies, Coprophagy, Food habits, Mud snails, Flax Pond(NY), New York, Denmark, Ponds, Lagoons, Sedimentation, Sediments, Carrying capacity.

A model is developed for resource renewal, geared to the deposit of feeding mud snails, Hydrobia minuta and H. ventrosa; additionally, a logistic model of recovery is proposed for living resources that are themselves limited by nutrients or space. The models are used to predict carrying capacities of Hydrobia; the renewal rate of resources exploited by a population influences carrying capacity and competitive interaction. Benthic animals such as Hydrobia which feed on deposits ingest sedimentary particles and organic debris, assimilate attendant microorganisms, and egest fecal pellets. Following egestion, the fecal pellets are recolonized by microorganisms, and again become a food source for deposit feeders. H. ventrosa would not ingest fecal pellets until they had broken down into component particles and debris, apparently an adaptive mechanism to ensure that ingested material has had sufficient time to be recolonized. Pellet breakdown rate is thus concluded to be an important limiting factor, and pellet breakdown is regarded as the renewable resource. Population densities predicted by the pellet breakdown model were in the general range of those measured for Hydrobia populations in the field. Hydrobia minuta specimens were collected from Flax Pond, New York, and specimens were collected from Flax Pond, New York, and specimens of H. ventrosa from a pond and lagoon in Denmark. In the resource renewal model, resource is always available if the fraction exploited per day is less than one minus the fraction remaining per day. (Lynch-Wisconsin)

CADMIUM ACCUMULATION BY THE MARINE RED ALGA PORPHYRA UMBILICALIS,
Aberdeen Univ. (Scotland). Dept. of Biochemistry.
M. W. McLean, and F. B. Williamson.
Physiologia Plantarum, Vol. 41, No. 4, 1977, p 268-272. 9 fig, 25 ref.

Descriptors: *Cadmium, *Zinc, *Porphyra umbilicalis, *Bioaccumulation, *Light, *Equilibrium, Heavy metals, Algae, Rhodophyta, Marine algae, Absorption, Hydrogen ion concentration, Darkness, Photosynthesis, Proteins, Cycloheximide, Autoradiography, Pollutants, Anabolism, Kinetics.

Cadmium accumulation by the marine red alga Porphyra umbilicalis under various light conditions was found to result from an ongoing anabolic process, and not the consequence of a pH gradient as provided by photosynthesis. Use of the protein synthesis inhibitor cycloheximide reinforced this conclusion, demonstrating that de novo protein synthesis is a prerequisite for cadmium accumulation. Autoradiographs show a specific intracellular location for bound cadmium, apparently the nucleus. Cadmium does not behave like zinc in several respects: (1) Light is essential for sustained cadmium accumulation, while zinc uptake is similar in light and darkness, despite reports that it is light-dependent. (2) The lag period before light stimulation occurs is much longer for cadmium (about 30 hrs) than for zinc (under one hr). (3) pH has a decisive effect on zinc accumulation. (4) Regarding uptake kinetics, zinc equilibrium is attained in only about 35 hrs in both light and darkness. Kinetics are initially first order with respect to plant mass, and rapidly approach equilibrium, with a final concentration factor of 255 reported. In contrast, a steady state for cadmium was only obtained in darkness or with cycloheximide; equilibrium was never achieved in the light even after 600 hrs and accumulation rate was directly proportional to plant mass, with metal concentration in solution not being significantly affected. DIFFERENCES IN PRODUCTIVITIES BETWEEN THE GREAT AUSTRALIAN BIGHT AND THE GULF OF CARPENTARIA, AUSTRALIA, IN SUMMER,
Hokkaido Univ., Hakodate (Japan). Faculty of Fisheries.
S. Motoda, T. Kawamura, and A. Taniguchi.
Marine Biology, Vol. 46, No. 2, 1978, p 93-99. 5 fig, 1 tab, 14 ref.

Descriptors: *Great Australian Bight, *Gulf of Carpentaria(Australia), *Phytoplankton, *Zooplankton, *Productivity, *Nutrients, *Bays, *Gulfs, Australia, Standing crops, Chlorophyll, Primary productivity, Biomass, Species composition, Algae.

Phytoplankton standing crop and primary productivity, along with zooplankton biomass, were much higher in Australia's Gulf of Carpentaria (north coast) than in the Great Australian Bight (south coast) as recorded on cruises in December 1965 (Great Australian Bight) and December 1968 (Gulf of Carpentaria). The unexpectedly low values for the bight are attributable to lack of nutrient replenishment from land or upwelling of deep water. Average phytoplankton standing crop was 27.3 mg chlorophyll-a/sq m in the gulf and 12.1 mg in the bight, average primary productivity was 133.1 mg C/sq m/hr in the gulf and 18.2 mg in the bight, and average zooplankton biomass was 305.3 mg wet wt/cu m in the gulf and 7.1 mg in the bight. Vertical stratification, which generally prevents nutrient replenishment in the euphotic layer, was weak in the bight despite low productivity. The bight's wide opening to the ocean probably induces vertical mixing due to oceanic currents. Transparency in the bight is low, apparently due to inorganic suspensions, and the result is a shallow euphotic layer. Bight water becomes progressively nutrient-depleted closer to the coast. On the other hand, the Gulf of Carpentaria is enriched by land drainage and inflow of originally nutrient-rich water from adjoining sea areas. Gulf water is neritic, as indicated by phytoplankton composition. (Lynch-Wisconsin)

PARTICULARATE ORGANIC MATTER IN SURFACE WATERS OFF SOUTHERN CALIFORNIA AND ITS RELATIONSHIP TO PHYTOPLANKTON,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
R. W. Eppley, W. G. Harrison, S. W. Chisholm, and E. Stewart.
Journal of Marine Research, Vol. 35, No. 4, November 1977, p 671-696. 7 fig, 4 tab, 55 ref.

Descriptors: *Phytoplankton, *Organic matter, *Southern California Bight, *Particulates, *Surface waters, Algae, California, Oceans, Bays, Euphotic zone, Carbon, Nitrogen, Chlorophyll, Adenosine triphosphate, Zooplankton, Particle size, Abundance, Standing crops, Eutrophication, Food webs.

Distribution and quantitative relationships among several biochemical parameters were studied during six cruises (September 1974-March 1976) in the Southern California Bight to estimate the relative

contributions of plankton to total particulate organic matter. Each parameter correlated with the others, suggesting that plankton (especially phytoplankton) contributed significantly to total particulate organic matter and was dynamically related to the total. Particulate carbon, nitrogen, chlorophyll-a, adenosine triphosphate (ATP), particle count, and particle volume were measured in the euphotic zone. Particle volume and number, as determined with a Coulter Counter, apparently measured both living and nonliving organic particulates well. Phytoplankton carbon accounted for an increasing proportion of total particulate carbon as the latter increased. Seasonal changes in estimated phytoplankton carbon: chlorophyll-a ratio paralleled changes in the photosynthetic assimilation ratio accompanying seasonal changes in temperature and irradiance. Sampling of diatom and dinoflagellate blooms permitted approximate determinations of carbon, nitrogen, ATP, and chlorophyll-a per particle, and the size of dominant organisms and species mixtures. The lifetime of total particulate matter in the euphotic zone, if none were refractory, was apparently only about 1-2 weeks, and its chemical composition resembled that of plankton. (Lynch-Wisconsin)

ALTERATION OF SWAMP FORESTS UNDER THE EFFECT OF DRAINAGE (IN RUSSIAN),
T. K. Kapustinskaite.
Lesovedenie (4) p 18-28, 1977.

Descriptors: *Drainage, *Oligotrophy, Swamps, *Swamp forests, Water pollution, *Mesotrophy, *Lithuania, *Oxalis-acetosella, Soils, Succession, USSR, *Vaccinium-myrtillus.

In the Lithuanian SSR (USSR) swamp forest biogeocenoses become stable not earlier than 20-25 yr after draining. On peaty soils of former oligotropic swamps, drained 30-40 yr ago, in place of Pinetum sphagnosum and p. iedosum of low quality V-V(a) quality class) Pinetum iedoso-pleuro-ziosium of IV-II quality class are are formed. On the areas of mesotrophic swamps. Pinetum cariscoso-sphagnosum, Piceetum caricoso-sphagnosum and Betuletum caricoso-sphagnosum of IV-V quality class give place to highly productive (II-I) forests with cover of Vaccinium myrtillus and Oxalis acetosella L. In place of medium productive Glutinosae Alnetum caricosum and Betuletum caricosum growing on soils of marshes, highly productive Glutinosae Alnetum caricoso-mixoherbosum and Betuletum caricoso-mixoherbosum arise. Forest phytocenoses on extremely poor soils of bogs and on rich soils of marshes change little under the influence of drainage.--Copyright 1978, Biological Abstracts, Inc.

PIGMENT DIVERSITY IN FRESHWATER PHYTOPLANKTON. II. SUMMER-SUCCESSION IN THREE DUTCH LAKES WITH DIFFERENT TROPHIC CHARACTERISTICS,
Amsterdam Univ. (Netherlands). Limnological Lab.
G. M. Hallegraeff.
Internationale Revue Der Gesamten Hydrobiologie, Vol. 62, No. 1, 1977, p 19-39. 4 fig, 3 tab, 32 ref.

Descriptors: *Pigments, *Phytoplankton, *Succession, *Trophic level, *Chromatography, *Lakes, *Analytical techniques, Netherlands, Pool t' Hammetje(Neth.), Barlosche Kolk(Neth.), Lake Maarsseveen(Neth.), Algae, Summer, Eutrophication, Chloroplasts, Chlorophyll, Floral lists, Spectrophotometry, Carotenoids, Methodology, Margalef pigment ratio.

Spectrophotometric and paper chromatographic analyses were made of chloroplast pigments in the phytoplankton of three Dutch freshwater lakes of widely different trophic characteristics during spring and summer 1973-75 to test Margalef's pigment ratio and pigment diversity propositions as indicators of changing phytoplankton physiological state and taxonomic composition. It is concluded that pigment ratios and carotenoid:chlorophyll-a ratios are inaccurate and insensitive pigement characteristics, and that in the description of diversity of pigments there is no alternative to chromatographic analysis. The chromatographically purified chlorophyll-a fraction, together with the occurrence of breakdown products of chlorophyll-a give valuable information on the stage of growth of phytoplankton populations. The pigment fractions fucoxanthin, peridinin, lutein and/or chlorophyll-b, and myxoxanthophyll can be used to indicate the contribution of the different major algal types to total phytophankton community pigments. In this way chromatographic pigment analysis may be an important tool in the description of phytoplankton community structure, particularly when used with results of microscopic phytoplankton analysis. The lakes studied, in order of decreasing lake fertility, were Pool 't Hammetje, Barlosche Kolk, and Lake Maarsseveen. (Lynch-Wisconsin)

A METHOD FOR ESTIMATING THE REGIONAL EFFECTS OF LAND USE ON RIVER-WATER QUALITY, SUSQUEHANNA RIVER BASIN, PENNSYLVANIA AND NEW YORK,
Geological Survey, Portland, OR. Water Resources Div.
D. J. Lystrom, and F. A. Rinella.
In: Proceedings of the 4th Joint Conference on Sensing of Environmental Pollutants, held in New Orleans, Louisiana, November 6-11, 1977: American Chemical Society, p 732-738, 1978. 3 fig, 2 tab, 16 ref.

Descriptors: *Model studies, *Regression analysis, *Water quality, *Drainage area, *Geomorphology, Land use, Sediments, Suspended load, Climatology, Streamflow, Flow characteristics, Topography, Soils, Equations, Analytical techniques, New York, Pennsylvania, *Susquehanna River basin.

This paper presents a framework for compiling available data for assessing statistical relationships between water quality and several factors of climate, physiography, and land use. Eleven water-quality properties were compiled for 85 subbasins in the Susquehanna River basin in Pennsylvania and New York. Water-quality properties are calculated loads or mean concentrations of suspended sediment, dissolved solids and various chemical species of nitrogen and phosphorus. Up to 57 basin characteristics were compiled for each of the 85 subbasins from available data sources. These characteristics represent six general categories: (1) climate, (2) topography, (3) geology, (4) soils, (5) streamflow, and (6) land use. Multiple linear regression equations were developed relating water-quality properties to basin characteristics. Usable regression equations were defined for 10 of the 11 water-quality properties. These equations explain from 58 to 89 percent of the variation of the water-quality properties, with standard errors of estimate ranging from 17 to 75 percent. The 10 equations can be used to estimate water quality at specific stream sites or to simulate the generalized effect of a specific basin characteristic, such as land use, on water quality. SCHISTOSOMIASIS DISTRIBUTION IN THE YEMEN ARAB REPUBLIC (IN RUSSIAN),
Volgogradskii Gosudarstvennyi Meditsinskii Inst. (USSR). Div. of Biology.
N. V. Bel'gesov, and G. R. Yarulin.
Med Parazitol Bolezn 45(4), p 403-404, 1976.

Descriptors: Biomphalaria-sp, Bulinus-sp, *Distribution, *Human diseases, Pathology, *Schistosomiasis, Uro, *Yemen Arab Republic.

Studies of intestinal and urogenital schistosomiasis distribution in the 6 provinces of Yemen indicate that while both forms are found in all provinces, the urogenita form is more common in the north and the intestinal form more common in the southern mountains. Less extensive invasion of both forms was observed in the coastal region. A study of 669 women in the San'a area revealed 4.7% with urogenital and 3% with intestinal schistosomiasis. More frequent invasion of men may be due to involvement in all aspects of irrigation and close contact with water. A test of 1518 Biomphalaria and Bulinus mollusks from natural water and reservoirs in the vicinity of San'a revealed that 171 (11.26%) of the specimens were hosting schistosome cercaria.--Copyright 1977, Biological Abstracts, Inc.

THE CHEMICAL COMPOSITION AND HYDROCHEMICAL REGIME OF THE WATER IN LAKE VIITNA LINAJARV (IN ESTONIAN),
Akademiya Nauk Estonskoi SSR, Tartu. Inst. of Zoology and Botany.
H. Simm, H. Starast, U. Malgi, and A. Lindpere.
Eesti Nsv Tead Akad Toim 24(4), p 295-308, 1975.

Descriptors: *Lake Viitna Linajarv(USSR), *Hydrochemistry, *Lakes, Color, Conifers, Forests, Gas regime, Macrophytes, Minerals, Phytoplankton, Soil, Water pollution effects.

Lake Viitna Linajarv is a seepage lake situated in a sandy area covered with coniferous forests. The lake feeds on phreatic water whose chemical composition is formed by the percolation of precipitation water through soil poor in organic substances and carbonates. The formation of the chemical composition of water has been influenced strongly by autochthonous factors, such as the copious occurrence of water vegetation, especially phytoplankton, and bottom mud which accumulated due to the decaying of macrophytes and phytoplankton. Human activity has induced the plant growth and the mud accumulation. The water color, the mineral dynamics and the gas regime in the lake have changed.--Copyright 1978, Biological Abstracts, Inc.

ICHTHYOLOGICAL AND HYDROLOGICAL OBSERVATIONS AND STUDIES ON YARINA COCHA, NEAR PUCALLPA AND ON THE RIO PACAYA (CENTRAL AND LOWER UCAYALI, E PERU), (IN GERMAN),
Zoologisches Forschungsinstitut und Museum Alexander Koenig, Bonn (West Germany).
K. H. Lueling.
Zool Beitr 21(1), p 29-96, 1975.

Descriptors: Water analysis, Eutrophication, Water pollution effects, Anabaena, Chironomus, Fish, *Hydrological studies, *Ichthyological studies, Microcystis, Oscillator, Pacaya, *Peru, Phytoplankton, Pucallpa, *Rio, Ucayali(Peru), *Yarina Cocha.

The biological-hydrographical conditions of the Yarina Cocha, situated in Peru, and its fish stock are discussed. A complete water analysis characteristic of the time of floods is included. During low water (in which the lake is separated from the river Ucayali) the water of the Cocha is of a greenish-dark grey color, sometimes with a tinge of greenish-blue, depending on the development of Microcystis, Anabena and Oscillatoria. Swarms of mosquitoes of the genus Chironomus are found above the water of the Cocha and its banks, particularly during the time of low water. At the end of July and during Aug. regular fluorescence of the water occurs due to a bloom of phytoplankton.--Copyright 1977, Biological Abstracts, Inc.

LONG-TERM FATE OF A HEAVY FUEL OIL IN A SPILL-CONTAMINATED B.C. COASTAL BAY,
Institute of Ocean Sciences, Sidney (British Columbia).
W. J. Cretney, C. S. Wong, D. R. Green, and C. A. Bawden.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 521-527, May 1978. 4 fig, 2 tab, 14 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil spills, *Biodegradation, Water pollution effects, Environmental effects, Intertidal areas, *Outer Continental Shelf, British Columbia, Fuel oil, Petroleum hydrocarbons.

The fate of accidently spilled No. 5 fuel oil in a small coastal bay in British Columbia was observed 6 times during 4 years. The oil's composition was first changed by loss of the lower molecular weight components by evaporation and dissolution. Biodegradation accounted for almost complete removal of n-alkanes in the 1st year. Pristane and phytane were biodegraded more slowly, but were almost completely gone in 4 years. The non-n-alkane components in the nC28-36 range seem to be the most resistant to degradation of all the components resolved in the gas chromatograms. The resistance to degradation of these components indicates their potential for long-term studies of oil spills. (Sinha-OEIS)

PRELIMINARY ASSESSMENT OF THE PRESENCE OF OIL IN THE ECOSYSTEM AT EKOFISK AFTER THE BLOWOUT, APRIL 22-30, 1977,
Torry Research Station, Aberdeen (Scotland).
P. R. Mackie, R. Hardy, and K. J. Whittle.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 544-551, May 1978. 4 fig, 6 tab, 19 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Water pollution effects, *Ecosystems, *Oil pollution, Environmental effects, *Outer Continental Shelf, North Sea, Platform Bravo, Hydrocarbons.

The marine environment in the Ekofisk area was assayed for the presence of oil components after the blowout on Platform Bravo was brought under control. Several methods of assay were used but the results were not always strictly comparable. Relatively high fluorescence values were observed in water samples in the vicinity of the platform. However, gas-liquid chromatography of these samples indicated that although some of the hydrocarbon fractions now resembled crude oil, none had increased markedly in concentration. The presence of oil could be detected in the biota and taste panels were able to identify an oily taint at low level in some fish caught near the platform. A second survey some 2 mo after the spill indicated that little, if any, oil from the blowout remained in the water column. (Sinha-OEIS)

WEATHERING CHARACTERISTICS OF PETROLEUM HYDROCARBONS DEPOSITED IN FINE CLAY MARINE SEDIMENTS, SEARSPORT, MAINE,
Bowdoin Coll., Brunswick, ME. Dept. of Chemistry; and Bigelow Lab. for Ocean Sciences, Boothbay Harbor, ME.
D. W. Mayo, D. S. Page, J. Cooley, E. Sorenson, and F. Bradley.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 552-562, May 1978. 20 fig, 2 tab, 7 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Sediments, *Oil spills, *Environmental effects, *Weathering, Water pollution effects, Clays, Clams, Maine, *Outer Continental Shelf, Petroleum hydrocarbons, Mya arenaria.

Further examination of the 1971 spill site in Long Cove, Searsport, Maine, has been carried out during 1976, and has led to the following observations: (1) Petroleum residues isolated from this spill give the appearance of weathering particularly slowly in the cold anoxic sediments of Long Cove. (2) Leaching from contaminated terrestrial sediments onto portions of the intertidal zone on the west shore of the Cove while continuing in trace concentrations does not appear to be making a major contribution to the maintenance of a nearly steady state pollution problem found in several areas of the Cove. (3) On the average, the spill area currently appears to contain roughly 20% less material than in 1971. At a number of sites, however, there appears to have been either little or no decline in gross hydrocarbon concentrations, and essentially no weathering of the aliphatic portions of the petroleum residues. (4) One of the principal factors to influence the character of petroleum residues isolated 5 yr postspill appears to have been the weathering of the hydrocarbons during transport to the site of sediment penetration from upland locations. Thus, the current distribution was determined early in the spill period. (5) Repopulation of the Cove by M. arenaria, which is proceeding very slowly, correlates directly with the gross concentration variations of petroleum hydrocarbons. (Sinha-OEIS)

Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 608-614, May 1978. 1 fig, 3 tab, 22 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil pollution, *Sediments, *Arctic, Benthos, Environmental effects, Water pollution effects, *Outer Continental Shelf, *Hydrocarbons, *Aromatic hydrocarbons, Petroleum hydrocarbons, Deposit feeders, Test species, Macoma inquinata, Phascolosoma, Protothaca.

Selected benthic animals were exposed to marine sediments contaminated with Prudhoe Bay crude oil, and uptake of hydrocarbons was monitored under various experimental schemes. When uptake of aliphatic and diaromatic hydrocarbons by two deposit feeders, Macoma inquinata and Phascolosoma agassizii, was compared with that of a suspension feeders, protothaca staminea, it was found that the deposit feeders generally accumulated hydrocarbons to a greater extent than the suspension feeder. However, other factors, such as the intrinsic capabilities of species to accumulate hydrocarbons, also played an important role in the extend of contamination. Hydrocarbon concentations in the bivalve species (M. inquinata and P. staminea) increased during the 60-day exposure period; whereas concentrations in the sipunculid Phascolosoma agassizii appeared to have reached an equilibrium relatively early in the exposure. Experiments on uptake of 14C-phenanthrene, -chrysene, -dimethylbenz (a) anthracene, and -benzo (a) pyrene by M. inquinata indicated that compounds directly associated with sediment were less available for uptake than those released from sediment to the surrounding seawater. Additionally, the heavier molecular weight aromatic compounds tended to be more concentrated in tissue and retained for longer periods of time than the lighter compounds. (Sinha - OEIS)

ECOLOGICAL AND PHYTOHISTORICAL INVESTIGATIONS OF LOWLAND BOG PLANT BIOTOPES OF OMBROTROPHIC BOG WITH SPECIAL RESPECT TO ITS POOLS AND LAKES IN NORTHWESTERN GERMANY, (IN GERMAN),
Kiel Univ. (West Germany). Botanisches Inst.
K. Mueller.
Beitr Biol Pflanz. 49(2), P 147-235, 1973.

Descriptors: Ammonium, *Biotopes, Bird, *Bogs, Bryophytes, Calcium, Carex-limosa, Dicots, Droppings, *Ecological, *Germany, Historical, Indicators, Lakes, Lowlands, Magnesium, Minerals, Monocots, Nitrates, *Studies, Ombrotrophic, Phosphates, Phytoplankton, Pools, Potassium, Pteridophytes, Sodium.

In ombrotrophic bogs fen plants only grow in certain habitats, especially in the region of flarks, soaks and pools. the main research was done in the well known mires of kAhlenmoor and Esterweger Dose/Westermoor, especially in and around the pools. The plants of 6 smaller pools are drawn on a map presenting the dominating pool carpet-Sphagna, the mineral soil water indicator plants as well as certain ombrominerabionta which concentrate here. It could be proved that the dynamics of succession in the Sphagnum carpets of the pools can be much greater than in full-growing hummock-holow complexes. Edaphic, hydrotopographic and microclimatic characteristics explain the conditions ofthe analysis of the vegetation in the region of fen plat habitats; the influence of animals on the mires was examined; furthermore pH, O2 content and the quantities of Na, Mg, K, Ca, P2O5, NH3 and NO3 in the water were analyzed and compared and were critically evaluated. The excrements of birds may cause an enrichment of N, P, andK by a maximum of 2 mg/l/yr. These results lead to a discussion of the occurrence of the bryophytes, pteridophytes, monocots and dicots found. Higher concentrations of nutritive substances in the waters lead to much richer growing but by no means are these concentrations necessary for the existence of the euminerobionta. Comparison with conditions of the other mires in the middle of Europe shows that, in interpreting the causes of the bog distribution, ranges of the ombrominerobionta as well as of the euminerobionta in ombrotorphic habitats regionally, the climate isthe most important.--Copyright 1974, Biological Abstracts, Inc.

ALTERATIONS IN GROWTH AND PHYSIOLOGY OF SOFT-SHELL CLAMS, MYA ARENARIA, CHRONICALLY OILED WITH BUNKER C FROM CHEDABUCTO BAY, NOVA SCOTIA, 1970-76,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Marine Ecology Lab.
E. S. Gilfillan, and J. H. Vandermeulen.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 630-636, May 1978. 4 fig, 3 tab, 21 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Water pollution effects, *Environmental effects, *Clams, *Oil spills, Oil pollution, Growth, Physiology, *Outer Continental Shelf, Nova Scotia, Mya arenaria, Petroleum, Bunker C oil.

Two populations of soft-shell clam, Mya arenaria, one from a chronically oiled lagoon (since the Arrow oil spill in 1970) and the other from a nonoiled lagoon, were compared as to population structure, growth, and metabolism. The oiled lagoon sediments contained up to 3800 micro g/g oil (UV determination), and clams up to 200 micro g/g hydrocarbon in their tissues (fluorescence). The oiled population of clams differed from the nonoiled population in lower total numbers with fewer mature adults, a 1-2-yr lag in tissue growth, a lower shell growth rate, and a reduced carbon flux with a lower assimilation rate. Results are interpreted to indicate that the recovery potential of M. arenaria in these oiled sediments is low and that these oiled populations remain under continued stress 6 years after the Arrow spill. STRUCTURE AND DYNAMICS OF THE FRENCH UPPER RHONE ECOSYSTEMS: II. HYDROLOGICAL AND ECOLOGICAL STUDY OF SOME BACKWATERS: FIRST RESULTS (IN FRENCH),
Lyon-I Univ., Villeurbanne (France). Dept. de Biologie Animaux et Zoologie.
J. Juget, C. Amoros, D. Gamulin, J. L. Reygrobellet, and M. Richardot.
Bull Ecol 7(4), p 479-492. 1976.

Descriptors: *Eutrophication, Waste waters(Pollution), Ecosystems, *France, Water pollution effects, Rivers, *Rhone River.

As a contribution to the general study of the French upper Rhone ecosystems, the morphometric and hydrologic characters of 2 ancient arms of the river, the Lone des Pecheurs and the Grande Lone, near Jons-Villette d'Anthon, below the point where the Rhone receives the Ain river were studied. These ancient arms or lones are silting up and are unstable, aquatic ecosystems. The more recent Lone des Pecheurs, is still connected with the main river and is influenced both by the varying level of the former and by the discharges from the phreactic waters. The border effect appears in the form of upstream to downstream gradients the sign and the amplitude of which depend on the nature of the parameters considered. The Grande Lone, now cut off from the main stream, has become very eutrophic, this character being enhanced by wastewater discharge.--Copyright 1978, Biological Abstracts, Inc.

E. H. Kampelmacher, A. W. Fonds, and L. M. Van Noorle Jansen.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. 157(4), p 313-327, 1973.

Descriptors: Aan, *Bacteriological studies, Bathers, Chlorides, Coasts, Coliforms, Dutch, E. coli, Frisian, Ijmuiden, Islands, Katwijk, Netherlands, Noordwijk, Salmonella, Scheveningen, *Sea water, Sewage, Streptococci, Wind, Zee.

The bacteriological quality of the sea water along the Dutch coast can be said to be good, apart from a few exceptions. In a large part of the area investigated, not more than 1 Escherichia coli/ml is found. In areas with a poorer bacteriological quality of sea water, this is due to the introduction of unpurified sewage. This is especially true of the Katwijk aan Zee and Scheveningen areas (the Netherlands). When the wind blows from the south westerly direction, there is a marked increase in the impurities. In addition to the introduction of sewage already mentioned, which was greatly reduced since 1971 due to various measures, the outlets of the great rivers, which are loaded with sewage also make an important contribution. The results of the samples from the Frisian Islands and the greater part of the southern area turned out to be extraordinarily favorable. The investigations have also clearly emphasized that the bacteriological conditions of the sea water is not affected by the number of bathers. In comparison with investigations made in 1970, it is striking that the results in 1971 are much better as regards fecal contamination. From the chloride determinations it appears that another type of weather was probably involved, the 'damming up' of fresh water of the coast occurring only to a slight extent. In addition the introduction of unpurified sewage was and is being reduced, especially at Katwiik aan Zee (the mouth of the 'Old Rhine') and Scheveningen to an increasing extent. Although the area sampled was much smaller, the results for 1972 are also favorable with the exception of inner Ijmuiden. The high levels of E. coli found here were to be anticipated in connection with the outlet of the North Sea Canal. Moreover, this area has no importance as a bathing beach. The results of the investigation at Noordwiik are more unfavourable in 1972 than for 1971. The chloride content of the water also fluctuated less. Since the chloride content is only to be considered an additional determination, it follows that the highest MPN (most probable number) at Noordwijk (3.7.72) does not coincide with the lowest chloride content (10.4.72). The absence of Salmonella emphasizes that infections with these organisms while bathing or swimming in the sea on the Dutch coast are still not to be feared.--Copyright 1974, Biological Abstracts, Inc.

SESTON AND SEDIMENT FORMATION IN FIVE LAKE DISTRICT LAKES,
Freshwater Biological Association, Ambleside (England).
W. Pennington.
J Ecol. 62(1), p 215-251, 1974.

Descriptors: Accumulation, Algae, Calcium, Carbon, Cesium-135, England, Eutrophication, Hypolimnion, Iodine, Lakes, Morphometry, Nitrogen, Postglacial, Potassium, *Productivity, *Sediments, *Seston.

Seston (total particulate matter in lake water) was collected in traps and measured over at least 1 annual cycle in 5 Lake District lakes (England), of contrasted morphometry and productivity. The organic fraction was estimated in all lakes, total N and I in 3, and in Blelham Tarn samples were analyzed monthly for C, N, I, K and Ca. The depth represented by the annual catch of seston was compared with the depth of the present annual increment to the sediments, as determined from distribution of fallout 137Cs (present in the atmosphere since 1954). Conclusions reached were: in shallow lakes resuspension and recirculation of once deposited material, particularly at the time of the autumn breakdown in stratification, resulted in seston catches of twice the volume of the permanent increment to the sediments, whereas in the deep lakes there was no significant difference between the volume of seston trapped and the annual increment; results of analysis of autumn seston from Blelham Tarn agreed with the postulated origin in resuspended material from the bottom; though in all lakes the present annual accumulation rate exceeds the mean post-glacial rate, this excess is significantly greater in the more productive lakes-those in which evidence for some degree of eutrophication within the last 2 centuries is present in the sediment profiles; comparison of composition of seston and sediment shows a higher percentage loss of organic matter from seston in those lakes in which the hypolimnion remains oxygenated throughout the year; and that these facts point to the survival into permanent sediment of organic matter from algal production in the 2 lakes which have become eutrophic-a situation which contrasts with that which has been present in Lake District lakes through most of post-glacial time.--Copyright 1974, Biological Abstracts, Inc.

INFLUENCE OF ENVIRONMENTAL CONTAMINATION ON CYTOCHROME P-450 MIXED-FUNCTION OXYGENASES IN FISH: IMPLICATIONS FOR RECOVERY IN THE WILD HARBOR MARSH,

Woods Hole Oceanographic Institution, MA. Dept. of Biology.
J. J. Stegeman.

Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p668-674, May 1978. 3 fig, 3 tab, 27 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environment's held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil spills, *Oil pollution, *Environmental effects, Marshes, Massachusetts, *Outer continental shelf, Petroleum hydrocarbons, Mummichog, Fundulus heteroclitus, Mixed-function oxygenases.

Levels of hepatic cytochrome P-450 and the catalytic functions benzo (a) pyrene hydroxylase and aminopyrine demethylase were significantly greater in populations of mummichog, Fundulus heteroclitus, sampled from contaminated marshes than in those fishfrom nearby reference marshes. Aminopyrene demthylase, but not benzo (a) pyrene hydroxylase, was also elevated in fish from one of the reference marshes. The levels of cytochrome P-450 and benzo (a) pyrene hydroxylase were highest in fish from the Wild Harbor, Marsh, site of the 1969 Florida spill. A correlation between size and benzo (a) pyrene hydroxylase activity ws identified in some of the populations studied, although influence by this factor did not mask the population differences. The results are consistent with the hypothesis that elevated levels of mixed-function oxygnase activity in fish from Wild Harbor are the result of oil spilled 8 yr ago, and that recovery of this marsh is not yet complete. RECOLONIZATION OF ROCKY SHORES IN CORNWALL AFTER USE OF TOXIC DISPERSANTS TO CLEAN UP THE TORREY CANYON SPILL,

Marine Biological Association ofthe United Kingdom, Plymouth (England). Plymouth Lab.
A. J. Southward, and E. C. Southward.

Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 682-706, May 1978. 21 fig, 2 tab, 132 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil spills, *Ecology, *Water pollution effects, *Environmental effects, Weathering, Algae, Intertidal areas, Toxicity, *Outer continental shelf, *Torrey Canyon, *United Kingdom, *Dispersants, *Recolonization, Rocky shores, Kuwait crude oil, Fucus, Entermorpha, Laminaria, Himanthalia.

Fourteen thousand tons of Kuwait crude oil, reduced from 18,000 tons by weathering at sea, was stranded along 150 km ofthe coast of West Cornwall, England, in March 1977. The oil was treated with 10,000 tons of toxic dispersants during cleaning operations. by itself the oil was not very toxic, although it kiled some limpets and barnacles, and most of the mortalities that followed cleaning were due to the dispersants. There was a graded effect. Most animals and some algae were killed on the shores treated heavily with dispersants, while a few animals and most algae survived in places less heavily treated. However, long stretches of coast were contaminated to some extent by drifting patches of oil and dispersants along the shore and by indiscriminate dispersants use in remote coves. The general sequence of recolonization was similar to that which has been found after small-scale experiments, where the rocks were scraped clean, or where limpets were removed, but took longer to complete. There was first a rapid 'greening' by the alga Enteromorpha; then a heavy settlement and growth of perennial brown algae (Fucus species), leading to loss of surviving barnacles. A settlement of limpets and other grazing animals followed, with eventual removal or loss of the brown alga. The final phases were a reduction in the lipet population and a resettlement of barnacles. lightly oiled, wave-beaten rocks that receie dlight dispersant treatment showed the most complete return to normal, taking about 5-8 yr; heabily oiled places that received repeated application of dispersants have taken 9-10 yr and may not be completely normal yet. (Sinha - OEIS)

COMPARISON OF OILED AND UNOILED INTERTIDAL COMMUNITIES IN CHEDABUCTO BAY, NOVA SCOTIA,

New Brunswick Univ., St. John. Div. of Sciences.
M. L. H. Thomas.

Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 707-716, May 1978. 3 fig, 9 tab, 23 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil pollution, *Water pollution effects, *Intertidal areas, Environmental effects, Clams, Sediments, Biota, *Outer Continental Shelf, Hydrocarbons, Nova Scotia, Mya arenaria, Littorina littorea, Petroleum hydrocarbons.

During 1976, detailed surveys of four oiled and four unoiled control stations, each subdivided into seven standardized intertidal levels, were carried out in Chedabucto Bay. Seventy-one species were found, 14 unique to control and 9 to oiled locations. Species diversity was uniformly higher at control than oiled stations. No differences in horizontal zonation of major species were apparent. Analysis of abundance and biomass data for the eight stations and seven tidal levels showed a significant overall difference between oiled and control situations. However, no particular station or tidal level was significantly different from any other. Ten species accounted for most of the variance between oiled and control stations. Six of these were more important at controls and four more important at oiled stations. The flora were particularly affected at oiled stations and species dominant on both sedimentary and rocky shores at all but the lowest tidal levels have been reduced. Length and weight data for the clam Mya arenaria showed significantly lower values at oil stations, but that for the periwinkle Littorina littorea showed the opposite. The length-weight relationship for both of these species showed a significantly lower increase in weight per unit of length at oiled than at control stations. Oiled stations showed significantly greater concentrations of oil in biota and sediments than unoiled, where concentrations were essentially at background levels. (Sinha-OEIS)

FLORIDA OIL SPILL IMPACT ON THE BUZZARDS BAY BENTHIC FAUNA: WEST FALMOUTH,

Woods Hole Oceanographic Institution, MA.
H. L. Sanders.

Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 717-730, May 1978. 18 fig, 3 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil spills, *Intertidal areas, *Water pollution effects, *Environmental effects, Statistics, Benthos, Massachusetts, *Outer Continental Shelf, *Petroleum hydrocarbons, Subtidal zone, Species composition, Buzzards Bay(Mass).

No matter what criterion is used to measure the effects of the Florida oil spill, the densities and species composition and the array of statistical methods demonstrate that the same hierarchical pattern emerges. Densities and species composition remain stable over time at the minimally oiled and unoiled stations, but display considerable fluctuations and marked changes at the more heavily oiled stations. With simple presence or absence data, highest fidelity is present at the marginally oiled stations, lower fidelity at the intermediately oiled stations, and lowest fidelity at the severely oiled stations. The discrepancy index measures mean yearly differences in faunal composition at each of the stations. Very large and large differences are documented for the severely and intermediately oiled stations but only small differences are found for the marginally oiled stations. The coefficient of variation is a measure of faunal variability throughout the entire sampling period for each of the stations. Faunal variation remains very high at the severely and intermediately oiled stations but low at the marginally oiled sites. Cluster analysis reveals profound temporal changes in the fauna from samples collected at the severely and intermediately oiled stations but demonstrates a much more homogeneous pattern with only small seasonal changes from samples obtained at the marginally oiled stations. NO. 2 FUEL OIL SPILL IN BOURNE, MASSACHUSETTS: IMMEDIATE ASSESSMENT OF THE EFFECTS ON MARINE INVERTEBRATES AND A 3-YEAR STUDY OF GROWTH AND RECOVERY OF A SALT MARSH,

Woods Hole Oceanographic Institution, MA; and Marine Biological Lab., Woods Hole, MA.
G. R. Hampson, and E. T. Moul.

Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 731-744, May 1978. 10 fig, 1 tab, 18 ref, append. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil pollution, *Salt marshes, *Ecology, *Oil spills, *Water pollution effects, *Environmental effects, Massachusetts, Invertebrates, Aquatic plants, Algae, *Outer Continental Shelf, Petroleum hydrocarbons.

On October 9, 1974 the oil barge Bouchard 65 loaded with 73,000 barrels of oil spilled what was initially thought by the Coast Guard to be a few barrels and later raised to an undetermined amount of No. 2 fuel oil off the west entrance of the Cape Cod Canal in Buzzards Bay, Massachusetts. Within the following 2-wk period, oil from the barge was found contained along the west side of Bassett's Island and inner Red Brook Harbor, a distance of 5.0 km from the site of the spillage. Qualitative samples of dead and moribund marine invertebrates were collected in tide pools and slight depressions along the beaches. A collection consisting of 4360 invertebrates comprising 105 species, plus 2 species of fish were found in 8 samples. Noticeable effects of the oil on the salt-marsh plant community were also observed. A detailed quantitative examination was begun to determine the effects of the oil on various components of the affected salt-marsh community in Winsor Cove compared to a selected control site. From the data collected in September 1977, the marsh grass in the lower intertidal zone in Winsor Cove has shown an inability to reestablish itself by either reseeding or rhizome growth. The associated sediments show a correspondingly high concentration of petroleum hydrocarbons impregnated in the peat substrate. Erosion rates measured in the af-

fected area, as a result of the 3-yr period of marsh degeneration, were 24 times greater than the control site. Microscopic algae were collected during the sampling period and those present were considered least sensitive to environmental changes. Examination of the interstitial fauna found in the study area in the summer of 1977 showed an extremely reduced number of individuals and species. (Sinha-OEIS)

LONG-TERM EFFECTS OF AN OIL SPILL ON FUCUS MACROFAUNA IN A SMALL BALTIC BAY,
Swedish Water and Air Pollution Research Lab., Nykoping. Baltic Sea Lab.
M. Notini.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 745-753, May 1978. 7 fig, 1 tab, 21 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil spills, *Water pollution effects, *Environmental effects, Benthos, Oil pollution, *Outer Continental Shelf, Petroleum hydrocarbon, Baltic Sea, Fucus vesiculosus, Mytilus edulis, Theodoxus fluviatilis, Gammarus, Iaera, Idotea.

On October 6, 1970, the small tanker Irini ran aground in the southern part of the Stockholm archipelago, releasing about 1000 t of medium and heavy fuel oil. Approximately 400 t drifted into a small bay, Gastiviken, wiping out nearly the entire littoral fauna. Most of the oil was collected mechanically during the winter, and by May 1971 cleanup operations were completed. The recruitment of the bladder wrack (Fucus vesiculosus) community in the bay was observed at intervals over a 5-year period. Significantly increased macrofauna population densities were found for a number of species in the 1974 and 1976 samples compared to those of 1971 and 1972. From June-July 1971 to June 1976, the mean numbers of individuals for all species rose. The bivalve Mytilus edulis increased in number from 0 to about 45, the gastropod Theodoxus fluviatilis from 0 to about 160, the amphipod Gammarus spp. from about 40 to 580, the isopods Idotea spp. from about 5 to 35, and Iaera spp. from almost 0 to about 10/100 g Fucus. Larvae of Chironomidae were the only group found with a decreased density between the first and sixth summers after the spill, with 240 and 145 individuals, respectively. The data obtained are discussed in relation to conditions in a nearby unpolluted bay and to normally occurring cyclic variations. (Sinha-OEIS)

OBSERVATIONS OF A COLD-WATER INTERTIDAL COMMUNITY AFTER 5 YEARS OF A LOW-LEVEL, PERSISTENT OIL SPILL FROM THE GENERAL M.C. MEIGS,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center; and Washington State Dept. of Ecology, Olympia.
R. C. Clark, Jr., B. G. Patten, and E. E. DeNike.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 754-765, May 1978. 9 fig, 2 tab, 18 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil spills, *Water pollution effects, *Environmental effects, Intertidal areas, Washington, *Outer Continental Shelf, Hydrocarbons, Petroleum hydrocarbons.

A rich and productive intertidal community was exposed continually for over 5 yr to small quantities of a Navy Special fuel oil from the unmanned troopship General M.C. Meigs that came aground on the Washington coast in January 1972. Observations of animal and plant populations and their petroleum hydrocarbon uptake patterns showed early evidence of contamination and the persistence of the oil spill throughout the study period. Abnormal and dead urchins, and loss of algal fronds and pigment were observed in localized areas near the wreck for at least 1 yr. Within 2 mo of the accident, paraffinic hydrocarbons had been taken up by prominent members of the community and continued to appear in certain species even after 5 yr. Although changes were seen in certain species during the early days of this persistent low-level pollution incident, the community balance in this rocky, intertidal ecosystem does not appear to have been markedly altered. (Sinha-OEIS)

RECOVERY OF BENTHIC MACROFAUNA FROM CHRONIC POLLUTION IN THE SEA AREA OFF A REFINERY PLANT, SOUTHWEST FINLAND,
Abo Akademi, Turko (Finland). Inst. of Biology; and Turku Univ. (Finland).
E. J. Leppakoski, and L. S. Lindstrom.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 766-775, May 1978. 10 fig, 3 tab, 38 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Water pollution effects, *Oil pollution, Environmental effects, Pollution abatement, Ecology, Benthos, Sediments, *Outer Continental Shelf, Baltic Sea, Finland, Species diversity, Recolonization, Chironomus plumosus.

Quantitative field studies (density, wet weight biomass, Shannon diversity, species richness, evenness of distribution) on benthic sublittoral macrofauna were made in the vicinity of an oil refinery in southwest Finland before and after the installation of a new wastewater treatment plant that reduced the amount of oil and liquid effluents. The number of species and species diversity increased during the 1st and 2nd year after pollution abatement at the stations close to the former outflows. The amphipods Pontoporeia affinis, Corophium volutator, and C. lacustre, midge larvae of the Chironomus plumosus-group, the oligochaete Tubifex costatus, the polychaetes Harmothoe sarsi and Polydora redeki, and the bivalve Cardium sp. were the most successful recolonizers of the 23 taxa sampled. The strong lethal effect of oil-contaminated sediments upon Chironomus plumosus larvae decreased markedly in laboratory experiments. Details of postabatement succession are discussed. The results demonstrate not only the recovery from chronic oil pollution but also the degree of ecological damage caused by previous continuous discharge of oil. (Sinha-OEIS)

Descriptors: *Toxicity, *Phospho-gypsum, *Phosphate fertilizers, *Vistula River(USSR), Amino-acids, Atp, Balanus-improvisus, Bay, Chlorophyll, Crangon-crangon, Embletonia-pallida, Embryo, Gammarus-sp, Gasterosteus-aculeatus, Gdansk, Hemolymph, Liver, Mitochondria, Nereis-diversicolor, Perch, Pike, Platichythys-flesus, *Poland, Rhithropanopeus-harrisi-tridentatus, Shrimp.

Phospho-gypsum (a waste product formed during the manufacture of phosphate fertilizers) added to water at concentrations of 2.59g/1-15 g/l caused within 3 days 100% mortality in the following species studied: Crangon crangon, Nereis diversicolor, Gasterosteus aculeatus, Rhitropanopeus harrisi, Gammarus sp., Mytilus edulis, Embletonia pallida, Platichthys flesus. These species are listed in order of increasing sensitivity to phospho-gypsum. After 4 days 100% mortality occurred in Balanus improvisus nauplii, Rhithropanopeus megalops and fertilized pike eggs in phospho-gypsum solutions containing 2.5 g/l, 10 g/l and 5 g/l respectively. At lower phospho-gypsum concentrations, some pike eggs hatched though fewer than in controls. In phospho-gypsum solutions the embryos developed more rapidly, and larvae were smaller as compared with controls. In shrimp phospho-gypsum solutions containing 3.75 g/l and 5 g/l caused an increase in the volume of hemolymph, a drop in its total protein content and a decrease in the tyrosinase activity. Concentrations of 187 mg/l and 312 mg/l inhibited ATP synthesis in the perch liver mitochondria. The 375 mg/l concentration caused swelling and damage to the mitochondria. In adult Rhithropanopeus the concentrations of 5 g/l caused degeneration of the brain neurosecretory cells. Under experimental conditions, in water from the Dead Vistula (Poland), containing phospho-gypsum at concentrations from 197 mg/l to 1.25 mg/l, the chlorophyll-a level rose. Detergent Solo had a similar effect. Concentrations of 7 free amino acids determined in water from the Dead Vistula and the Gdansk Bay exhibited seasonal fluctuations. Highest concentrations occurred in mid Aug. The amino acid level was higher in the Dead Vistula than in the Gdansk Bay.--Copyright 1978, Biological Abstracts, Inc.

LONG-TERM EFFECTS OF OIL SPILLS ON MARINE INTERTIDAL COMMUNITIES,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Biology; and Newcastle upon Tyne Univ. (England).
K. H. Mann, and R. B. Clark.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 791-795, May 1978. 4 fig, 10 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, Oct 10-14, 1977.

Descriptors: *Oil spills, *Oil pollution, *Environmental effects, *Water pollution effects, Biota, Sediments, Toxicity, Ecosystems, Arctic, *Outer Continental Shelf, Petroleum hydrocarbons.

The title of this symposium is 'Recovery Potential of Oiled Marine Northern Environments'. It is clear from the case histories of oil spills reported here that the potential for recovery is indeed present. In most cases, within 10 years of a single incident the community structure has returned to something approaching its normal state. The rate of recovery depends on many factors. One is the toxicity and quantity of oil involved; light fuel oil is much more toxic than crude oil or bunker oil and causes much greater environmental damage. Another is the nature of the shoreline on which the oil is stranded; on a high-energy, rocky shore the oil is dispersed and removed by wave action much more quickly than on a sheltered, sedimented site, where the oil may become incorporated in sediments, persist for many years, and cause chronic perturbation to the ecosystem. A third is the biology of the organisms that have been affected. Organisms with little or no mobility and slow rates of reproduction will take much longer to recolonize a damaged area than species that product large numbers of young that are widely dispersed. Since the former is a characteristic reproductive pattern for many organisms living in high latitudes, recovery of damaged arctic environments may be much slower than that of the temperate and subboreal environments that were the subject of these investigations. USE OF DREDGED MATERIAL ISLANDS BY COLONIAL SEABIRDS AND WADING BIRDS IN TEXAS,
Texas A and I Univ., Kingsville.
A. H. Chaney.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-8, April 1978. 317 p, 66 fig, 3 tab, 116 ref, 9 append.

Descriptors: *Birds, *Environmental effects, Islands, Habitats, *Texas, *Wading birds, Dredged material, *Dredged material disposal, *Waste disposal sites, Colonial birds.

Dredging operations in shallow coastal bays and estuaries have generated islands that have become a substrate for the development of plant and animal communities. Certain of these islands with their vegetative communities have become attractive to colonial seabirds and wading birds as nesting sites. This report assesses the environmental impact of dredged material disposal sites by gathering information on these islands in Texas waters. Thirty-four islands were selected for study, 17 in the Galveston-Houston area and 17 in the upper Laguna Madre near Corpus Christi. The islands were photographed, visited by boat, and measured as to elevation and area. More than 3000 soil samples were taken. Vegetation on each island was identified, measured, and quantified in over 3000 quadrats. Plant communities were identified and vegetation maps of each island were constructed. Birds using the islands as nesting sites were identified and their nests were monitored. Location of colonies was plotted on island maps and nesting information was summarized and placed in tabular form. Numbers and species of nesting birds were compared with those nesting on natural sites along the Texas coast. Recommendations were made concerning island construction, maintenance, and management in relation to nesting seabirds and wading birds. (WES)

THE PRODUCTION BIOLOGY OF EURASIAN WATERMILFOIL (MYRIOPHYLLUM SPICATUM L.): A REVIEW,
Michigan State Univ., Hickory Corners. W.K. Kellogg Biological Station.
J. B. Grace, and R. G. Wetzel.
Journal of Aquatic Plant Management, Vol. 16, p 1-11, June 1978. 2 fig, 4 tab, 95 ref. NSF BMS-75-20322 ERDA EY-76-02-1599, COO-1599/131.

Descriptors: *Eurasian wate milfoil, *Reviews, *Plant physiology, *Nutrient requirements, *Limiting factors, *Primary productivity, Myriophyllum spicatum, Myriophyllum exalbescens, Aquatic weeds, Aquatic weed control, Biology, Production, Submersed plants, Macrophytes, Photosynthesis, Respiration, Carbon, Biomass, Light, Competition, Kinetics, Absorption.

High inorganic carbon-fixing efficiency is partly responsible for the success of Eurasian water milfoil (Myriophyllum spicatum) in colonizing new habitats, replacing other submersed macrophytes, and avoiding nutrient limitations, according to a review of literature on physiological aspects of the aquatic weed's productivity. Avoidance of nutrient limitation apparently is related to certain anatomical features that aid in refixation of respired carbon dioxide. Milfoil seems disadvantaged in utilizing available light (based on metabolic criteria), but its growth form compensates for any metabolic deficiencies. The ability of M. spicatum to avoid nutrient limitations (especially nitrogen and phosphorus) is probably the result of root uptake from sediments and low requirement for these minerals, rather than because of well-adapted uptake kinetics. When evaluated by quantitative criteria, milfoil is not especially productive despite excessive growth. Anatomical features, growth form, low nitrogen and phosphorus requirements, and high vegetative reproductive capacity are major factors determining the distributional and competitive success of M. spicatum. Information reviewed in this paper is important in designing control methods, in understanding competition between milfoil and other plants (particularly in regard to light), and in studies of energy flow and nutrient cycling in lakes and reservoirs. EFFECT OF WATER LEVEL FLUCTUATION AND HERBICIDE ON EURASIAN WATERMILFOIL IN MELTON HILL RESERVOIR,
Tennessee Valley Authority, Muscle Shoals, AL. Div. of Environmental Planning.
T. L. Goldsby, and A. L. Bates.
Journal of Aquatic Plant Management, Vol. 16, p 34-38, June 1978. 3 fig, 3 tab, 6 ref.

Descriptors: *Melton Hill Reservoir(TN), *Eurasian water milfoil, *Aquatic weed control, *Drawdowns, *Herbicides, *Methodology, *Chemcontrol, Mechanical control, 2,4-D, Tennessee, Tennessee Valley Authority, Impoundments, Clinch River, Myriophyllum spicatum, Water level fluctuations, Dewatering, Winterkilling, Freezing.

The most effective and economical way to control Eurasian water milfoil (Myriophyllum spicatum) in Melton Hill Reservoir, south of Oak Ridge, Tennessee on the Clinch River, was a combination of maintenance treatments with the herbicide 2,4-D, and high frequency, short-duration winter drawdowns. M. spicatum, first observed in the reservoir in late 1965, presumably was established in spring 1964. Short-duration drawdowns during cold weather effectively reduced infestation and did not proportionally increase infestations in deeper areas. Periodic exposure to subfreezing temperatures for 2-3 days had no effect on root crown viability, which could be reduced only by prolonged exposure sufficient to freeze the hydrosoil. Herbicidal treatment with the butoxyethanol ester and dimethylamine salt of 2,4-D at a rate of 22.5-45.0 kg acid equivalent/ha was effective against the plant. The drawdown and herbicide treatment schedule 1971-76 involved: (1) 1971-72--low water levels maintained mid-October to mid-February. (2) intermittent low water level mid-June to September 1972. (3) 1973-75--normal water level (about 241.5-242.1 m MSL), with 2,4-D treatment during the growing season. (4) 1975-76 and 1976-77--2-3 day drawdowns twice per month from August or September to March, with 2,4-D treatment during the growing season. The drawdown schedule for 1975-76 was as effective as the long-term drawdown of 1971-72. (Lynch-Wisconsin)

TOXICITY OF SULFURIC ACID TO AQUATIC PLANTS AND ORGANISMS,
Florida State Game and Fresh Water Fish Commission, Eustis. Eustis Fisheries Research Lab.
L. L. Trent, R. S. Hestand, III, and C. C. Carter.
Journal of Aquatic Plant Management, Vol. 16, p 40-43, June 1978. 3 fig, 13 ref.

Descriptors: *Toxicity, *Hydrilla verticillata, *Sulfuric acid, *Aquatic weed control, *Environmental effects, Acids, Fish, Aquatic animals, Insects, Bioassay, Hydrogen ion concentration, Najas guadalupensis, Vallisneria americana, Chara, Midges, Shrimp, Snails, Scuds, Mosquitofish, Largemouth bass, Micropterus salmoides, Gambusia affinis, Hyallela azteca, Palaemontes, Chironimidae, Planorbidae.

Field applications of sulfuric acid are more harmful to aquatic fauna than to Hydrilla verticillata and other aquatic weeds. Bioassay evaluation of the acid as a control for the nuisance weeds, and of effects on selected aquatic fauna, showed that aqueous solutions of sulfuric acid at pH 3 produced no toxic effects on hydrilla, but were extremely toxic to all faunal groups. Sulfuric acid would also be hazardous to the applicator and to the public, require high dosages, and produce erratic, unpredictable results. Testing of hydrilla, southern naiad (Najas guadalupensis), Vallisneria americana, and Chara sp in 57-liter aquaria resulted in erratic and temporary plant control, and effects were generally confined to the lower portion of the plants in direct contact with the acid layer. High plant density buffered toxic effects to a great degree. Fauna and hydrilla were tested in 3.8-liter bioassay jars. Fauna included largemouth bass (Micropterus salmoides), mosquitofish (Gambusia affinis), scuds (Hyalella azteca), fresh-

water shrimp (Palaemontes sp.), midges (Chironomidae), and snails (Planorbidae). All but midges and mosquitofish were killed at pH 3 within 24 hours. Snails, scud, and shrimp were very sensitive to pH change, with all scud killed at pH 3 in six hrs and all shrimp in two hrs. Largemouth bass were very tolerant to pH 5, but at pH 3 all were dead after 24 hrs. Mosquitofish mortality at pH 3 was 60% after eight hrs, and 80% after 24 hrs. (Lynch-Wisconsin)

COMPARATIVE EFFECTS OF GRASS CARP AND SELECTED HERBICIDES ON MACROPHYTE AND PHYTOPLANKTON COMMUNITIES,
Florida State Game and Fresh Water Fish Commission, Eustis. Eustis Fisheries Research Lab.
R. S. Hestand, and C. C. Carter.
Journal of Aquatic Plant Management, Vol. 16, p 43-50, June 1978. 6 fig, 3 tab, 11 ref.

Descriptors: *Macrophytes, *Phytoplankton, *White amur, *Herbicides, *Biocontrol, *Aquatic weed control, *Succession, *Eutrophication, Algae, Ctenopharyngodon idella, Fish, Chemcontrol, Hydrothol, Diquat, Cutrine, Nutrients, Phosphorus, Nitrates, Degradation(Decomposition), Najas guadalupensis, Chara, Ceratophyllum demersum, Myriophyllum spicatum, Hydrilla verticillata, Vallisneria americana.

Test pools containing communities of six aquatic macrophytes were treated with the herbivorous fish white amur (Ctenopharyngodon idella), Hydrothol 191, or diquat and Cutrine Plus to test biocontrol effectiveness and side effects on phytoplankton. Herbicide treatments quickly killed all plants tested--southern naiad (Najas guadalupensis), Chara sp., coontail (Ceratophyllum demersum), Eurasian water milfoil (Myriophyllum spicatum), Hydrilla verticillata, and Vallisneria americana--but nutrients released triggered dense phytoplankton blooms. White amur (grass carp) slowly consumed the macrophytes without producing the predicted stimulatory effects on phytoplankton. Approximately equal numbers of the six plants were planted in each of 45 plastic pools 366 cm in diameter, and allowed to establish for one year. Nine pools were stocked with one white amur each, nine were controls, and the rest were treated with herbicides (detailed in a previous paper). Southern naiad was eliminated by white amur in 130 days, Chara in 180, Coontail in 200, hydrilla in 205, and water milfoil in 265. Vallisneria increased until day 240, then declined; it was the least preferred by white amur. Southern naiad declined and coontail was eliminated by competition in controls, while water milfoil increased slightly and vallisneria increased considerably in controls. Effects of treatment on water quality and phytoplankton succession are discussed. (Lynch-Wisconsin)

EFFECT OF PH ON THE NATURE OF COMPETITION BETWEEN EICHHORNIA CRASSIPES AND PISTIA STRATIOTES,
Khartoum Univ. (Sudan).
M. Tagel Seed.
Journal of Aquatic Plant Management, Vol. 16, p 53-57, June 1978. 2 fig, 3 tab, 17 ref.

Descriptors: *Water hyacinth, *Hydrogen ion concentration, *Competition, *Ecology, *Water lettuce, *Limiting factors, Niches, Eichhornia crassipes, Light, Space, Aquatic plant, Pistia stratiotes, Floating plants, Acids, Plant growth.

Greenhouse experiments to test effects of various pH levels (4,7, and 9) on space competition between water hyacinth (Eichhornia crassipes) and water lettuce (Pistia stratiotes) showed Eichhoria to hae a clear advantage in mixed cultures, sometimes completely displacing Pistia. Plants of comparable size were chosen from natural populations. Five treatments were studied: a monoculture of each species and three mixed cultures in which each plant represented 25%, 50%, or 75% of the population, while initial overall density was kept constant at four plats. Plants were grown in three-liter plastic containers in 2% standard Long-Ashton culture solution; pH was adjusted using 5% sulfuric acid (with additions of anhydrous sodium sulfate) or 10% for 48 hrs, and dry weights determined. The Pistia monoculture indicated pH 4 was optimum for dry weight growth. Eichhornia yield decreased with increase in its proportion in mixed cultures at all pH levels, suggesting greater intraspecific than interspecific competition, but at all pH levels Eichhornia was the gaining species and Pistia the losing species. The number of Eichhornia plants remained constant in all cultures, Probably due to container limitation. The results demonstrate that the critical competitive element was limited surface (i.e., Light). (Lynch-Wisconsing)

THE EFFECT OF DAYLENGTH AND TEMPERATURE ON HYDRILLA GROWTH AND TUBER PRODUCTION,
Florida Univ., Gainesville.
T. K. Van, W. T. Haller, and L. A. Garrard.
Journal of Plant Management, Vol. 16, p 57-59, June 1978. 2 fig, 1 tab, 10 ref.

Descriptors: *Hydrilla verticillata, *Tubers, *Plant growth, *Water temperature, *Photoperiods, *Reproduction, Aquatic plants, Aquatic weed control, Light, Day length, Florida, Seasonal, Growth stages, Life cycles.

Pool studies in northern Florida (1976-77) of tuber formation by Hydrilla verticillata confirmed an earlier report that tuberization occurred October-April; a sharp decline noted December-January was due to cold weather. Growth chamber studies indicated the seasonal tuber production was production was primarily a response to short-day stimulus. Critical day length for tuberization apeared to be 13 hrs. No tubers were formed May-August when vegetative growth was greatest. Temperature had a marked effect on hydrilla growth ad tuber production; with maintenance of a 10-hr photopeiod, tuberization increased with increasing temperatures up to 33 C. At 9 C no tubers were formed, indicating that cold temperature was the primary reason for the drop in tuberization in mid-winter in the pool studies. Increased tuberization at higher temperatures was associated with a general increase in vegetative growth. Under tuber-inducing conditions (10-hr photoperiod), Tuberization appeared to depend on a adequate supply of phtosynthate. Higher temperatures during growth probably permitted more rapid photosynthate production, resulting in more tubers and larger size. in contrast with several other plants, cold water temperature is not required for hydrilla tuberization. Because of the temperature effect, maximum tuber production in the South may occur in fall and winter, but in the north only in fall. (Lynch-Wisconsin)

MACROINVERTEBRATES AND DIATOMS ON SUBMERGED BOTTOM SUBSTRATES, LAKE POWELL,
New Mexico Univ., Albuquerque. Dept. of Biology.
L. D. Potter, and E. Louderbough.
Available from the National Technical Information Service Springfield, VA 22161 as PB-272 692, Price codes: A04 in paper copy, A01 in microfiche. Report NSF/RA-770232, March 1977. 46 p. 5 fig, 3 tab, 31 ref, 1 append.

Descriptors: *Lake Powell(AZ UT), *Macroinvertebrates, *Diatoms, *Methodology, *Artificial substrates, *Periphyton, *On-site data collections, *Bottom sampling, Chironomids, Larvae, Reservoirs, Lakes, Arizona, Utah, Algae, Species composition, Species diversity, Diversity indices, Physa, Snails, Dermatitis, Human diseases, Baseline studies, Substrates, Biological communities, Fish food organisms, Water level fluctuations.

Plastic Christmas trees 57 cm tall were successfully used as artifical substrates to study the macroinvertebrate and diatom periphytic community in the littoral of Lake Powell (Arizona-Utah). The technique permitted collection, processing, and quantification of organisms associated with inundated vegetation. The trees were planted along a sloping sandy bottom at depths of 2, 3, 4, 5, 6, 8, and 10 meters, and at 4- and 12-week intervals between July 1973-October 1974, the trees were harvested using plastic bags, organisms were removed and the trees were replanted. Density and species composition were determined, and a diversity index was computed for the diatom component. Data indicate the organisms associated wth inundated vegetation constitute an improtant part of available fish food in the lake's littoral zone. Of macroinvertebrates, 95% were chironomid larvae (95% Dicrotendipes). Snails of the genus Physa, which can function as hosts for schistosome-dermatitis-producing cercariae, were found to concentrate on trees submerged for 12 weeks. The potential heath problem may impair recreational use of the lake, especially as shoreline biolmass increases. Though Lake Powell's aquatic community is developing in a manner similar to other man-made lakes, fluctuating water level and high sediment load produce a changing bottom substrate. A major remaining procedural problem is separation of fine silt from orgaisms. (Lynch-Wisconsin)
W79-00782

PLANKTON COMMUNITY STRUCTURE: EVALUATION OF ANALYTICAL METHODS USING MODEL COMMUNITIES,
Georgia Univ., Athens. Dept. of Zoology.
W. B. Hayes.
Available from the National Technical Information Service, Springfield, VA 22161 as SR0-852-2. Price codes: A06 in paper copy, A01 in microfiche. ERDA Report No. SR0-852-2, July 1976. 110 p. 9 fig, 13 tab, 19 ref, 1 append. AT(38-1)852.

Descriptors: *Computer models, *Plankton, *Analytical techniques, *Affinity tests, *Model studies, *Water pollution effects, *Statistical methods, Biological communities, Computer programs, Species composition, Effluents, Thermal pollution, Methodology, Bioindicators, Species diversity, Association analysis, Similarity, Fager test, Orloci method, Goodall index.

Three affinity tests (by FAger, Orloci, and Goodall) were evaluated for use in assessing plankton community structure as a means of measureing effects of effluents on plankton. A distribution model ws used to generate artificial data for the evaluation. The tests were: (1) Fager's recurrent group technique, (2) the Orloci sum-of-squares agglomeration method, and (3) Goodal's probabilistic similarity index. The Fager and Orloci procedures performed equally well with the model communities, but with samples taken along an outfall control line the Fager procedure was clearly superior. Problems in running the Goodall program made conclusive evaluation impossible. An appendix gives computer programs used in the study. Affinity testing can be used to supplement bioindicators and diversity indices in environental impact analysis. Also termed association analysis, affinity testing measures the degree of similarity between two or more objects, each of which is described by a set of attributes. For plankton colmmunities, the analysis can take various forms: (1) the objects can be sites, with affinity defined by the number of species in common at the sites; (2) the objects can be individual species, with affinity determined by occurrence in the same localities; and (3) the entire species list for an area can

be used as an indicator by grouping the stations; stations near the outfall may form a distinctive group. (Lynch-Wisconsin)

FLUORESCENCE LIFETIMES OF CHLORELLA PYRENOIDOSA,
Imperial Coll. of Science and Technology, London (England). Dept. of Botany.
L. E. Harris, G. Porter, J. A. Synowiec, C. J. Tredwell, and J. Barber.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 954, Price codes: A02 in paper copy, A01 in microfiche. Biochemica et Biophysica Acta, Vol 449, 1976, p 329-339. 3 fig, 1 tab, 28 ref.

Descriptors: *Chlorella pyrenoidosa, *Fluorescence, *Equations, *Photosynthesis, *Lasers, *Degradation(Decomposition), *Measurement, Algae, Chlorophyta, Kinetics, Darkness, Picoseconds, Nanoseconds, Methodology, Research equipment.

Fluorescence decay of the green alga Chlorella pyrenoidsosa was investigated under a variety of conditions in the picosecond and nanosecond time spans. Most flurorescence was accounted for by an expression of the form I(t)=I sub o exp-(At*Bt to the one-half power), though a additional exponential term was required to include a weak component of lifetie 32 ps observable only at the higher pulse intensities. This interpretation reconciles earlier and apparently conflicting data. The weak 32 ps component may be associated with Photosystem I, although it may an artifact of the high intensity pulses used. The main fluorescence, described by the equation above, is attributed to antenna chlorophyll; its form would be expcted from a single light harvesting array with trapping at randomly distributed sites. The form of the fluorescence decay given by the equation for C. pyrenoidosa should apply to the fluorescence of all green plants. In the experiments the picosecond pulses from a mode-locked eodymium (3+) glass laser were used. Fluorescence response was detected with an IMACON 600 streak camera coupled to a vidicon multichannel analyzer. Fluorescence from a photosynthetic organism provides direct insight into the initial photochemical processes involved in photosynthesis, and the technique used here extends the time resolution of fluorescence measurement. (Lynch-Wisconsin)

LEAF DECOMPOSITION IN A TROPICAL RAINFOREST STREAM,
Ohio State Univ., Columbus. Dept. of Botany.
D. E. Padgett.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 106, Price codes: A03 in paper copy, A01 in microfiche. Doctoral dissertation, Ohio State University Graduate School, 1975. 42 p, 11 fig, 7 tab, 47 ref, 2 append.

Descriptors: *Degradation(Decomposition), *Leaves, *Tropical regions, *Streams, *Rain forests, *Hyphomycetes, Fungi, Plant tissues, Puerto Rico, Luquillo National Forest(Puerto Rico), Spores, Proteins, Calories, Weight, Nitrogen, Enzymes, Running waters, Campylospora chaetocladia, Pyramidospora casuarinae, Triscelophorus monosporus.

Enzymatic activity of certain freshwater fungi (hyphomycetes) was a significant factor in decomposition of submerged leaf litter in a small stream in the Luquillo National Forest, a tropical rain forest in Puerto Rico. Leaf discs (1.4 cm in diameter) of Buchenavia capitata, Manilkara bidentata, and Dacryodes excelsa disintegrated completely in 26 weeks, compared with 32 weeks for Sloanea berteriana and Cordia borinquensis. Twelve hundred discs of each species were oven-dried five days at 45C, placed in 1.8-sq mm mesh screen packets, and anchored in the stream. Stream ranged from 3-32 cm in depth, and 27 cm to 2.3 m in width; base flow through its pools was normally 2-3 cm/sec. Morphological changes accompanying disintegration followed two basic patterns, depending on the rate at which epidermal layers disappeared; patterns were similar in that disintegration was restricted to localized areas within the discs. No relationship was detected between weight loss and disintegration patterns, however. Sixteen species of hyphomycetes were identified from spores in stream foam or on submergedf leaves. Campylospora chaetocladia, Pyramidospora casuarinae, and Triscelophorus monosporus appeared to be involved in decomposition because of frequent appearance on the leaf discs. No significant increases in leaf disc nitrogen content were found that could be related to fungal protein, but caloric changes during disintegration suggested increasing fungal biomass. (Lynch-Wisconsin)

RELATION BETWEEN AQUATIC PLANTS AND GASTROPODS (MOLLUSCA, GASTROPODA) IN THE REGION OF THE GENTILLY I NUCLEAR CENTER (QUEBEC) (IN FRENCH),
Quebec Univ., Trois-Rivieres. Dept. of Chemistry-Biology.
E. Lacoursiere, G. Vaillancourt, and R. Couture.
Can J Zool 53(12), p 1868-1874, 1975.

Descriptors: *Aquatic plants, *Canada, *Gastropods, Gentilly, *Mollusca, Nuclear powerplants, Quebec, Rivers, *Thermal pollution, Water pollution effects.

This study is based on a sampling of the gastropods present in the vegetation of the St. Lawrence riverside zone at Gentilly (Canada). A total of 536 plant specimens belonging to 20 spp. as well as 37,239 specimens of 10 spp. of gastropods were sampled. Prosobranchs have no affinity whatsoever for any plant species in particular. The pulmonates, however, are found mainly on emergent plants.
W79-00794

PHYTOPLANKTON PRODUCTIVITY IN TOMAHAWK LAGOON, LAKE WAIPORI AND LAKE MAHINERANGI,
Otago Univ., Dunedin (New Zealand). Dept. of Zoology.
S. F. Mitchell.
N Z Mar Dep Fish Res Div Bull N S. 3, p 9-87, 1971.

Descriptors: *Phytoplankton, Photosynthesis, *New Zealand, *Lakes, Lagoons, *Productivity, *Lake Waipori,(NZ), Lake Mahinerangi(NZ).

In Lake Mahinerangi, a power-supply reservoir, the phytoplankton productivity as estimated by the 14C method is comparable with that in the least productive temperate lakes that have beeeen investigated. Mean rates of production in the daylight hours in 1964-65 were 2.02 mg of C/m3/hr at near-optimal light intensity (Pmax) and 76 mg of C/m2/day. Multiple regression analyses showed that 78.3% of the variation in hourly Pmax during 1964-65 could be accounted for by variations in temperature, water level, and day length. During summer and autumn, when productivity was highest, large fluctuations in productivity were recorded at the main sampling station at Lake Mahinerangi and these appeared to be related largely to variations in temperature. The annual production of O2 by photosynthesis in Lake Mahinerangi, as estimated from bottle experiments during 1963-64, amounts to only about 1/2 of the annual consumption by respiration. The concentrations of soluble reactive phosphate ranged from 0 to 3.0 mg of PO4-P/m3 ad showed no seasonal pattern of variation. Concentrations of other ionic solutes were low by comparison wth those in other New Zealand lakes. Oxygen concentrations at sunrise were within the range of 90-101% of saturation and did not vary with depth. In almost all of the samples from Lakes Mahinerangi and Waipori, which lie on the same river system, the most abundant phytoplankton were Cyclotella stelligera Cleve et Grunow and one of 2 spp. of Gymnodinium (G. limitatum Skuja and Gymnodinium sp.). Phytoplankton productivity per unit volume in Lake Waipori was slightly higher than that in Lake Mahinerangi. When the lakes were compared the mean assimilation per unit chlorophyll decreased in the same order as the mean productivity. Phytoplankton productivity, as estimated by the 14C method, varied between 36 and 88% light and dark bottle oxygen production estimates of gross productivity when the methods were compared directly in 4-hr experiments in Tomahawk Lagoo. tCopy--Copyright 1971, Biological Abstracts, Inc.

THE KNOWLEDGE OF THE PLANKTON OF LAKES OF GREECE: III. THE ZOOPLANKTON OF LAKE VENGORITIS. (IN GERMAN),
H. Mueller.
Folia Biochim Biol Graeca 13(3/4), p 67-90, 1976.

Descriptors: Eutrophication, *lake Vengoritis, *Phytoplankton, *Zooplankton, Water pollution effects.

Vengoritis Lake shows a wide variety of zooplankton and phytoplankton species. Many kinds are typical for this lake and are not found in other Macedonian lakes. Some of the plankton species indicate a level of eutrophy.--Copyright 1977, Biological Abstracts, Inc.

ZOOPLANKTON OF THE REGION OF NOSY-BE: V. CLADOCERA: CONTRIBUTION TO THE STUDY OF A TROPICAL EUTROPHIC BAY, (IN FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Nosy-Be (Madagascar). Centre Oceanographique (ORSTOM) de Nosy-Be.
S. Frontier.
Cah O R S T O M Ser Oceanogr. 11(3), p 259-272, 1973.

Descriptors: Zooplankton, Bays, *Cladocera, Estuaries, Eutrophication, Evadne-tergestina, Filtration, Malagasy-Republic, Nosy-Be, Penilia-avirostris, Phytoplankton, Rainfall, Sesonal, Tropical, *Zooplankton.

Spatiotemporal variations of the populations of Penilia avirostris and Edvane tergestina are discussed. The 2 spp. belong to the internal neritic settlement; the former is more strictly coastal than the latter. The populations develop very fast in the bays (Malagasy Republic) after the 1st heavy rains (Dec.). They reach a 1st maximum level in Feb.-March and a 2nd in July-Aug. separated by an interseasonal decrease. The 1st maximum is the principal maximum for Evadne. The situation is opposite for Penilia. The populations decrease drastically in Sept. During stratification of the neritic water (wet season), Evadne remains generally in the more superficial layers than Penilia. With the surface drifting toward the open sea and the estuarine circulation prevailing at this time of the year it sweeps Penilia towards the external neritic zone. Cladoceran populations seem to follow closely the abundance variations of phytoplankton, the later being directly affected by river flow. They are an essential link in trophic chains because of the filtration power they represent. (See also W77-02416)--Copyright 1975, Biological Abstracts, Inc.

ENTRAINMENT AT A ONCE-THROUGH COOLING SYSTEM ON WESTERN LAKE ERIE,
Michigan State Univ., East Lansing. Inst. of Water Research; and Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
R. A. Cole.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 953, Price codes: A08 in paper copy, A01 in microfiche. Report No EPA-600/3-78-070, July 1978. Vol I of II, 154 p, 19 fig, 37 tab, 80 ref. R801188.

Descriptors: *Entrainment, *Electric power plants, *Lake Erie, *Cooling water, *Thermal pollution, Aquatic life, *Plankton, *Environmental effects, Zooplankton, Cyanophyta, Chlorophyta, Phytoplankton, Periphyton, Ichthyoplankton, Chloride, Fish, Larvae, Aquatic environment, Industrial water, Fish conservation, Aquatic habitats, Conservation.

The rates of entrainment and effects on important components of the aquatic community being passed once through the cooling system of the steam-electric power plant (the Monroe Power Plant) were assessed. Phytoplankton, zooplankton, ichthyoplankton, and community metabolism were sampled bimonthly over a 3-yr period at fixed locations in the intake region, discharge canal, thermal plume, and source waters of Lake Erie. Concentrations of chloride and dissolved and total solids were used to trace water masses and their associated nutrient and plankton concentrations. At temperatures above 15 C in the discharge canal, photosynthesis was depressed and community respiration was accelerated. Algal abundance increased slightly with gree and blue-green algae increasing more than other taxa during passage; however, algal diversity remained basically unchanged. Densities of zooplankton declined about 40% in the cooling system, but diversity remained unchanged and the impact was masked by mixing in the receiving waters. Larval fish were concentrated near bottom at night and moved up during the day, and there were both temporal and geographical variations in distributions; consequently, some fish larvae seemed more vulnerable to entrainment than others. Large enough numbers of certain ichthyoplanktonic species and Leptodora kindtii may be entrained to at least slightly influence population abundances of adult organisms in western Lake Erie. The regeneration rates of smaller planktonic organisms in the source waters are likely to negate the local impact of the cooling systems on their populations. (Majtenyi-IPA)

PHYTOPLANKTON OF ALKALINE WATERS AT KANEM (CHAD): VII. THE STRUCTURE OF POPULATIONS, (IN FRENCH),
Lab. Hydrobiol., ORSTOM, N'djamena, Chad.
A. Iltis.
Cah O R S T O M Ser Hydrobiol. 8(1), p 51-76, 1974.

Descriptors: *Chad, Kanem, *Phytoplankton, *Salinity, Species, Biological communities, *Alkaline water, Ponds, Salt balance.

Phytoplankton organization was studied in a series of natroned temporary ponds and permanent lakes. In permanent waters, the higher the salinity of the lake, the lower the species diversity. Changes in the species diversity during 1 yr are not interpretable. The variations of the equitability follow those of the species diversity. Motumura's log-linear law of distribution can be adjusted to almost all the different species abundance distributions, the constant of milieu or Motomura's constant is lower as the salt concentration of the water is high. EFFECTS OF WATER QUALITY, ANTIBIOTICS, PHYTOPLANKTON AND FOOD ON SURVIVAL AND DEVELOPMENT OF LARVAE OF SCYLLA SERRATA (CRUSTACEA:PORTUNIDAE),
Univ. Hawaii, Kaneohe, Inst. of Mar. Biol.
R. W. Brick.
Aquaculture. 3(3), p 231-244, 1974.

Descriptors: *Antibiotics, Artemia-salina, B. chlorella, Crustaceans, Food, Larvae, Penicillin, Phytoplankton, Polymyxin, Portunidae, Rotifers, Scylla-serrata, Survival, Water quality, Zooplankton, Water pollution effects.

Larvae on the portunid crab S. serrata were successfully reared using a combination of antibiotics (penicillin-G + polymyxin-B), phytoplankton (Chlorella sp.) and appropriate food (Artemia salina nauplii). Antiobiotics enhanced premetamorphic survival of zoeae while leaving rate of zoeal development and success of metamorphosis to megalopa unaltered. Water filtration and ultraviolet sterilization had no significant effect on rates of zoeal survival or development. Although antibiotics did not affect metamorphosis of megalopa to the crab stage, the antibiotic mixture may have been detrimental to survival to megalopae. The presence of Chlorella, unlike antibiotics, left zoeal survival unaffected while stimulating production of megalopae. As with antibiotics, time from hatching to megalopa formation was unaltered by the presence of Chlorella. Survival and development of zoeae varied with type and concentration of food organisms used. Feeding with Artemia nauplii produced highest larval survival and continued development. Rotifers and zooplankton as a food source failed to support zoeal survival to the onset of metamorphosis and failed to enhance survival when fed in combination with Artemia nauplii. A daily optimum food concentration of 10 Artemia nauplii/ml was established for zoeal survival. Megalopae survived better at the higher food (Artemia) concentrations used and tended to develop more rapidly to the crab stage at higher food levels.--Copyright 1975, Biological Abstracts, Inc.

RELATIONSHIP BETWEEN CYTOPLASMIC DISTRIBUTION OF MERCURY AND TOXIC EFFECTS TO ZOOPLANKTON AND CHUM SALMON (ONCORHYNCHUS KETA) EXPOSED TO MERCURY IN A CONTROLLED ECOSYSTEM,
British Columbia Univ., Vancouver. Inst. of Oceanography.
D. A. Brown, and T. R. Parsons.
Journal Fisheries Research Board Canada, Vol 35, p 880-884, 1978. 2 tab, 33 ref.

Descriptors: *Water pollution effects, *Heavy metals, *Toxicity, *Mercury, Salmon, Zooplankton, *Ecosystems, *Controlled Ecosystem Pollution Experiment(CEPEX), Oncorhynchus keta, International Decade of Ocean Exploration(IDOE).

Fish and zooplankton were simultaneously exposed to trace, 1, and 5 micro g Hg/L. In fish and zooplankton, pathological effects appeared to coincide with saturation metallothionein and 'spillover' of Hg into the high molecular weight protein (enzyme-containing) pool. Coincidential with increase of Hg in tissue were decreases of Cu and Zn. Pathological effects of Hg are explained in terms of tertiary and quaternary structural changes in metalloenzymes resulting from replacement of Cu and Zn by Hg. Decreases in tissue Cu and Zn with increasing Hg concentration are discussed as an intracellular displacement of Cu and Zn by Hg and as duodenal and cellular exclusion processes. (NOAA)

SENSITIVITY OF THREE MICROALGAE TO CRUDE OILS AND FUEL OILS,
Texas Univ., Port Aransas. Marine Science Inst.
J. C. Batterton, K. Winters, and C. Van Baalen.
Marine Environmental Research, Vol 1, p 31-41, 1978. 1 fig, 6 tab, 8 ref. Also as Texas University Marine Science Institute Contribution No. 275. NSF OCE73-09740-A01 and OCE76-83913.

Descriptors: *Algae, *Toxicity, *Oil pollution, *Water pollution effects, Environmental effects, Testing, Photosynthesis, Cyanophyta, Chlorophyta, Diatoms, Crude oils, Fuel oils, Chlorella autotrophica, Agmenellum quadruplicatus, Cylindrotheca sp., International Decade of Ocean Exploration(IDOE).

Four crude oils and five fuel oils have been tested for toxicity with three microalgae--a blue-green, a green and a diatom. The crude oils were less inhibitory than equal amounts of fuel oils. Photosynthesis of a sensitive organism Chlorella autotrophica, strain 580, was only temporarily depressed by the crude oils. Four of the fuel oils inhibited photosynthesis, O2 output decreasing to zero without recovery. Classes of aromatic compounds which were not accountable for the toxicity observed here include naphthalene, methylnapththalenes, dibenzothiophenes, phenanthrenes and compounds with volatilities greater than methylnaphthalenes. Paraffinic and asphaltic fractions of fuel oil were also non-toxic. The accumulated chemical data suggest that the toxicity of whole fuel oils is due to the less water soluble types of compounds in the higher boiling aromatic fraction. (NOAA)

DIVERSITY AND LONGITUDINAL ZONATION IN FISH POPULATIONS OF TWO STREAMS ENTERING A METROPOLITAN AREA,
Toledo Univ., OH. Dept. of Biology.
E. J. Tramer, and P. M. Rogers.
Am Midl Nat. 90(2), p 366-374, 1973.

Descriptors: Diversity(Fish), *Fish populations, Metropolitan areas, Notropis-stramineus, Water pollution, Semotilus-astromaculatus, Streams, *Zonation(Fish), *Ohio.

The distribution and relative abundance of fishes were surveyed in Swan and Tenmile creeks, Lucas County, Ohio, from their headwaters in a rural agricultural area to points near the center of the city of Toledo, Ohio. In each creek 21 spp. were found. Of the total of 27 spp. collected only 2 Semotilus atromaculatus and Notropis stramineus, occurred at each sample station. Species diversity along both streams followed no definite pattern, even when the creeks became grossly polluted, since declines in the number of species present were often offset by shifts toward relative abundances which were more evenly distributed. Fish species diversity was not correlated with an index of habitat diversity. Furthermore, unlike other longitudinal zonations, diversity was not correlated with mean depth of the stream or with

distance from the headwaters; and species composition changes took the form of replacements rather than additions to the headwaters assemblage. Pollution stress probably cancelled out the effects of factors such as substrate diversity and mean depth, thereby obliterating the normal patterns of diversity and longitudinal zonation.--Copyright 1974, Biological Abstracts, Inc.

THE EFFECTS OF TEMPERATURE ON THE GROWTH AND SURVIVAL OF LARVAL AND JUVENILE CRAYFISH, PACIFASTACUS LENIUSCULUS,
California Univ., Davis. Dept. of Animal Science.
J. W. Cornacchis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 435, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, June 1978. 64 p, 11 fig, 13 tab, 52 ref. (California Water Resources Center Project UCAL-WRC-W-475). OWRT A-056-CAL(4).

Descriptors: *Crayfish, *Temperature, *Thermal pollution, Thermal stress, Growth stages, *Larval growth stage, *Juvenile growth stage, *Growth rates, Water pollution effects, Mortality.

The growth and survival of compartmentalized subyearling Pacifastacus Leniusculus were studied in the laboratory at temperatures of 14.5 degrees through 25.5 degrees C. Growth in weight was maximum at 22.0 degrees C. Cephalothorcic growth was .0642 mm/day (stages II-V) at the same temperature. The temperature predicted to produce optimum growth in length for stages II to V was calculated to be 20.0 degrees C. The effects of temperature on crayfish growth were primarily due to the acceleration of developmental rates as opposed to differences in incremental growth. Hiatt graphic analysis demonstrated that the coefficient of growth ranged from 1.16 to 1.33. Mortality was proportional to thermal shock during state I. After stage I, crayfish reared at warmer temperatures had the best record of survival except at 17.0 degrees C. Morphometric analysis revealed that a linear relationship existed between diameter and weight of eggs. A new allometric model is presented that describes weight as a function of length of carapace in larval and juvenile stages (<13 mm). (Snyder-Calif Davis)

THE EFFECTS OF IRRIGATION RETURN WATER ON AQUATIC PLANTS (PERIPHYTON) IN THE SACRAMENTO RIVER AT KNIGHTS LANDING, CALIFORNIA,
California Univ., Davis. Dept. of Land, Air and Water Resources.
S. P. Hayes, A. W. Knight, D. E. Bayer, and G. R. Sanford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 322, Price codes: A05 in paper copy, A01 in microfiche. Technical Completion Report, Contribution No. 167, California Water Resources Center, University of California, Davis, February 1978. 75 p, 13 fig, 93 tab, 45 ref, 2 append.

Descriptors: *Irrigation water, *Return flow, Effects, *Aquatic plants, *Sacramento River(Cal), Summer, Seasonal, Measurement, Evaluation, Outfalls, Water quality, Abiotic factors, Biotic parameters, Statistical methods.

The characteristics of irrigation return water (IRW) from the Glenn-Colusa Irrigation District (GCID) and the impact of the IRW on the Sacramento River water (SWR) were studied through three summer irrigation seasons at stations above, in, and below the Colusa Drain at Knights Landing, California. The IRW in this outfall (IO) has significantly higher levels of all the abiotic factors measured (suspended matter, water turbidity, specific electrical conductance, major cation and major anion concentrations, water temperature, and hydrogen ion concentrations) than the SRW above the outfall (AO). The biotic parameters evaluated (densities of dominant diatoms, total diatom density, chlorophyll a, b, and c levels, and caloric content or organic matter levels) were obtained from periphyton communities harvested from glass substrates, and often had values significantly lower in IO and AO, with enhancement at stations below the outfall (BO). Stations were compared statistically using an analysis of variance followed by Duncan's multiple-range transformation of the data. The GCID IRW was found to differ significantly from the SRW and to have an impact on the SRW BO. (Graf-Cornell)

MAMMALIAN TOXICOLOGICAL EVALUATION OF WASTEWATERS RESULTING FROM THE MANUFACTURE OF PRIMERS,
Midwest Research Inst., Kansas City, MO.
H. V. Ellis, III, and D. O. Helton.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A034 890, Price codes: A05 in paper copy, A01 in microfiche. Report to U.S. Army Medical Research and Development Command, Contract No. DAMD-17-75-C-5053, 88 p, October 1975. 5 fig, 6 tab, 21 ref.

Descriptors: *Toxicity, *Industrial wastes, *Chemical wastes, *Explosives, Chemical properties, Chemical analysis, Organic compounds, Animal physiology, Mortality, Chromatography, Waste water(Pollution), Lead, Bioassay, Water pollution effects, *Antimony, *Munitions, Munitions wastes.

Chemical characterization and animal toxicity studies on five desensitized primers, four wastewaters from primer production and one desensitization 'blank' were performed. High pressure liquid chromatography was most useful in characterizing the organic compounds present in the various samples. The original organic compounds were present in trace quantities of entirely absent from desensitized pure tetrazene, desensitized pure lead styphnate, desensitized pure trinitroresorcinol, tetrazene wastewater, primer mixture FA 956 wastewater, lead styphnate wastewater, and trinitroresorcinol wastewater. Desensitized tetrazene and desensitized primer mixture FA 956 were moderately toxic, with LD50's between 3 and 5 g solids/kg body weight in rats. Lot 3 of tetrazene wastewater was relatively toxic, with LD50's between 0.3 and 0.8 g/kg in rats and mice. The toxicity appears to be due to two characterized but unidentified organic compounds. The other samples were nontoxic in these animals. (EIS-Deal)

AQUATIC LIFE FIELD STUDIES AT BADGER ARMY AMMUNITION PLANT, (FINAL PHASE II REPORT, VOLUME 1),
Battelle Columbus Labs., Columbus, OH.
J. M. Stilwell, D. C. Cooper, M. A. Eischen, M. C. Matthews, and B. E. Sherwood.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A033 547, Price codes: A06 in paper copy, A01 in microfiche. Report to U.S. Army Medical Research and Development Command, DAMD 17-74-C-4123, 100 p, August 1976. 16 fig, 17 tab, 50 ref.

Descriptors: *Chemical wastes, *Toxicity, *Explosives, Water quality, Water analysis, Water chemistry, Bottom sediments, Benthic fauna, Periphyton, Industrial wastes, Organic compounds, Chemical properties, Water pollution effects, Chemical analysis, Phytoplankton, *Munitions, *Species diversity, *Nitrocellulose, *Nitroglycerin.

The objective of this study was to collect quantitative data describing the specific nature of effluent effects and the amount of primary munitions constituents in the effluents. Areas investigated included water quality, sediment chemistry, munitions constituent concentrations, periphyton community and the benthic macroinvertebrate community. In addition, the ecological responses to two primary munitions compounds, nitrocellulose and nitroglycerine, were examined. (EIS-Deal)

ACUTE TOXICITY OF RESIDUAL CHLORINE AND AMMONIA TO SOME NATIVE ILLINOIS FISHES,
Illinois State Water Survey, Urbana. Dept. of Registration and Education.
D. P. Roseboom, and D. L. Richey.
Illinois State Water Survey, Report of Investigation 85, 1977, ISWS/RI-85/77, 42 p. 10 fig, 13 tab, 61 ref, 5 append.

Descriptors: *Chlorine, *Ammonia, *Illinois, Freshwater fish, Bioassay, Toxicity, Mortality, Laboratory tests, Sunfish, Channel catfish, Bass, *Water quality standards, *Water pollution effects, Water temperature.

Ninety-six hour residual chlorine bioassays were conducted on bluegill and channel catfish. In 96-hour acute toxicity studies with ammonia (NH3-N) bass, in addition to blue-gill and channel catfish, were included. The studies were performed in waters typical of most lakes and streams in midwestern states, i.e., relatively high in alkalinity and the salts of calcium and magnesium. Observations regarding the characteristics and reaction of the fishes to each toxicant were noted. For residual chlorine the 96-hour TL50s ranged from 0.18 to 0.33 mg/l for bluegill, depending on temperature and fish weight. For channel catfish the TL50 was about 0.09 mg/l; temperature was not a factor. For ammonia the 96-hour TL50s for bluegill were dependent on temperature and fish weight and varied form 0.40 to 1.3 mg/l. Size was not a factor for bass and channel catfish. Ninety-six hour TL50s for these fishes ranged from 0.72mg/l at 22C to 1.2mg/l at 30C for bass and 1.5mg/l at 22C to 3.0mg/l at 28C for channel catfish. For the protection of the fishes investigated, and consistent with the water pollution regulations of Illinois, residual chlorine

in Illinois waters should not be detectable and NH3-N should not exceed a concentration of 0.04 mg/l. (EIS-Deal)

CRISIS SCIENCE: INVESTIGATIONS IN RESPONSE TO THE ARGO MERCHANT OIL SPILL,
Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
A. M. Pollack, and K. D. Stolzenbach.
Sea Grant Program Report No. MITSG-78-8, Index No. 78-308-Cmw, June 1978. 329 p, 42 fig, 3 tab, 90 ref, append. SG-04-7-158-44079.

Descriptors: *Oil spills, *Water pollution effects, Massachusetts, Oil pollution, Biological effects, *Argo Merchant oil spills.

The Argo Merchant oil spill on Nantucket Shoals (Massachusetts) in December 1976, was the focus of a massive scientific investigation. More than 200 scientists were involved in predicting and studying the fate and effects of the spill, at a cost exceeding $800,000. The report outlines three reasons scientists might want to take action following a spill and points out that previous post-spill activities have been somewhat less than successful in meeting these goals. The scientific work following the Argo Merchant spill is then reviewed as a case study of such post-spill science. The story of how the scientific response developed is told more or less chronologically and the scientific follow-up to the spill was not as good as it could have been. This was partly because of science's limited understanding of spills and limited ability to interpret data; but it was also partly because of logistical and institutional facotrs. The case is made that studying a spill is in many ways as demanding as trying to clean it up. A quick and efficient response is needed on extremely short notice to prevent valuable data from being lost and to provide scientific input into the cleanup effort in a timely manner. Some sort of research contingency plan is needed. This report concludes with some guidelines for formulation of such a plan. (NOAA)

IRON-ALGAE INTERACTIONS AS A FACTOR IN LAKE ERIE WATER QUALITY,
State Univ. of New York at Fredonia. Environmental Resources Center.
T. A. Storch.
Sea Grant Report. (1977), 25 p, 8 fig, 1 tab, 14 ref.

Descriptors: *Water quality, Algae, Photosynthesis, *Lake Erie, *Iron, *Phytoplankton, Phosphorus.

Nutrient enrichment analyses revealed that both chelated and unchelated iron affect the phytosynthetic rate of natural phytoplankton communities in eastern Lake Erie. Depending on the form, the concentration, and the time of year, iron additions may stimulate or inhibit algal photosynthesis. However, iron discharges from wastewater treatment plants using iron for phosphorus removal may not significantly affect algal growth in Lake Erie because of the high dilution effect. (NOAA)

TOXICITY AND SUBLETHAL EFFECTS OF NO. 2 FUEL OIL ON THE SUPRALITTORAL ISOPOD LYGIA EXOTICA,
Texas A and M Univ., College Station. Dept. of Biology.
T. M. Dillon, J. M. Neff, and J. S. Warner.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p 320-327, 1978. 1 fig, 2 tab, 15 ref.

Descriptors: Oil, *Oil spills, *Isopods, *Toxicity, *Respiration, Oil pollution, Fuels, Organic compounds, Animal behavio, Animal physiology, Animal metabolism, Mortality, Absorption, Water pollution effects, Tissue analysis, *Dibenzothiophenes, *Lygia.

No. 2 fuel oil was of relatively low toxicity to the intertidal isopod Lygia exotica. Respiration was not significantly affected by short-term exposure to several concentrations of No. 2 fuel oil prepared as either a water-soluble fraction or an oil-in-water dispersion. Lygia contaminated by a spill of No. 2 fuel oil and Bunker C residual oil contained high concentrations of dibenzothiophenes. It is not known whether the dibenzothiophenes were accumulated by the Lygia tissues or adsorbed to the exoskeleton. Therefore, the high mortality of Lygia following the spill cannot yet be attributed to the dibenzothiophenes. (EIS-Deal)

THE EFFECT OF LEAD ON OXYGEN UPTAKE IN THE CRAYFISH, ORCONECTES VIRILIS (HAGEN),
Northern Illinois Univ., De Kalb. Dept. of Biological Sciences.
R. V. Anderson.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p 394-400, 1978. 3 fig, 21 ref.

Descriptors: *Lead, *Crayfish, *Toxicity, Heavy metals, Air pollution effects, Animal physiology, Animal metabolism, Path of pollution, Oxygen requirements, Oxygen demand, Water chemistry, Water quality, Water analysis, Chemical analysis, Water pollution effects, Crustaceans, *Tissue analysis, *Bioaccumulation.

It was determined that increasing concentrations of lead will cause some decrease in the ability of O. virilis to take up oxygen. The crayfish was able to acclimate to the metal concentration by compensating for decreased gill efficiency through increasing its ventilation volume. Crayfish tend to take up lead primarily in the exoskeleton and gills. Concentration in these body parts increased as environmental concentration and time increased. (EIS-Deal)

FIELD VERIFICATION OF CADMIUM TOXICITY TO LABORATORY DAPHNIA POPULATIONS,
Argonne National Labs, IL. Radiological and Environmental Research Div.
J. S. Marshall.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, No. 3, p 387-393, 1978. 1 fig, 3 tab, 5 ref.

Descriptors: *Cadmium, *Growth rates, *Toxicity, *Daphnia, Metals, Mortality, Population, Productivity, Reproduction, Epilimnion, Water chemistry, Chemical analysis, Water analysis, Regression analysis, Laboratory tests, Bioassay.

The purpose of this paper is to compare the short-term toxicity of cadmium to laboratory populations of D. galeata mendotes with that to natural populations of D. galeata mendotae and total Daphnia in Lake Michigan, as indicated by its effects on the populations' rates of increase. The relationship between the two populations' growth rates and cadmium concentrations was analyzed using regression analysis. While some differences between the two populations, they were observed, they were judged to not differ significantly in their sensitivity to cadmium.

A SUBLETHAL TECHNIQUE FOR ASSESSING THE EFFECTS OF CONTAMINANTS USING HYDRA LITTORALIS,
Institute for Marine Environmental Research, Plymouth (England).
A. R. D. Stebbing, and A. J. Pomroy.
Water Research, Vol. 12, p 631-635, 1978. 5 fig, 1 tab, 28 ref.

Descriptors: *Copper, *Toxicity, *Reproduction, Metals, Metabolism, Resistance, Growth rates, Adaptation, Cytological studies, Bioassay, Chemical analysis, Water quality, Water chemistry, Water analysis, Water pollution effects, *Hydra.

A technique is described for estimating the biological effects of low levels of contaminants using an index of response the rate of asexual reproduction of Hydra littoralis. Preliminary experiments show the rate of reproduction becomes significantly inhibited by levels of 2-12 micrograms Cu2+ l-1, although it appears that the rate oscillates for some days after the initial exposure to inhibitory agents. A control mechanism appears to regulate the rate of asexual reproduction and within the range of 0.5-2.5 microgram Cu2+ l-1 this mechanism enables the organism to counteract the inhibitory effect of copper, restoring growth to that of the controls after about 7 days. The concept of a quantifiable counter response is considered in a toxicological context. (EIS-Deal)

EFFECTS OF COPPER, PH AND HARDNESS ON THE CRITICAL SWIMMING PERFORMANCE OF RAINBOW TROUT (SALMO GAIRDNERI) RICHARDSON,
Guelph Univ. (Ontario). Dept. of Zoology.
K. G. Waiwood, and F. W. H. Beamish.
Water Research, Vol. 12, p 611-619, 1978. 5 fig, 3 tab, 70 ref.

Descriptors: *Copper, *Hydrogen ion concentration, *Hardness(Water), *Water chemistry, *Rainbow trout, Water analysis, Toxicity, Fish behavior, Metals, Heavy metals, Fish physiology, Animal metabolism, Water pollution effects, Mortality, Copper compounds.

Critical swimming velocities of Salmo gairdneri at 12C were determined in different combinations of copper, pH, and hardness. Measurements were made after exposure for 0.5, 5, 10, and 30 days. When copper was not applied, hardness, pH, and exposure time had no appreciable effect on critical performance. Copper had the greatest effect on swimming performance at 5 days of exposure. For any given hardness, copper had a greater effect on critical speed at low than at high pH. A given copper treatment had a more pronounced effect at low than at high hardness. Oxygen consumption of trout was determined in different combinations of copper and pH. In the presence of copper the maximum oxygen consumption decreased and the energy expenditure for a given swimming speed increased. The above observations are discussed in relation to reported toxic actions of copper. (EIS-Deal)
W79-00945

THE EFFECT OF PREHATCH AND POSTHATCH EXPOSURES TO CADMIUM ON SALINITY TOLERANCE OF LARVAL GRASS SHRIMP, PALAEMONETES PUGIO,
Environmental Research Lab., Gulf Breeze, FL.; and Environmental Research Lab., Johns Island, SC. Bears Bluff Field Station.
D. P. Middaugh, and G. Floyd.
Estuaries, Vol. 1, No. 2, p 123-125, 1978. 2 fig, 1 tab, 11 ref.

Descriptors: *Cadmium, *Toxicity, *Salinity, *Shrimp, *Resistance, Metals, Growth rates, Embryonic growth stage, Larval growth stage, Mortality, Water pollution effects, Water temperature, Bioasay, *Survival.

Groups of embryonic grass shrimp, Palaemonetes pugio, were exposed to cadmium for the last 1, 4 or 8 days prior to hatching. Other groups of embryos were cultured in uncontaminated seawater. Prehatch exposure to cadmium was found to have no additive effect on the sensitivity of the larvae to cadmium exposure and salinity stress for 14 days after hatching. No significant decreases in survival were observed for any larvae transferred to 15 and 30 ppt salinity at a pre- and posthatch cadmium concentration of 0.1 mg/l. At a pre- and posthatch cadmium concentration of 0.3 mg/l, significant decreases in survival were observed for all of the larvae transferred to 10 and 15 ppt salinity after hatching. Significant decreases in survival were observed for only 2 of the groups exposed before hatching and transferred to 30 ppt salinity and 0.3 mg/l cadmium after hatching. (EIS-Deal)

ECOLOGICAL STUDIES OF FISHPONDS IN CHUPEI,
National Taiwan Univ., Taipei Dept. of Zoology.
Y. S. Lin.
Bulletin of the Institute of Zoology, Academia Sinica, Vol. 17, No. 1, p 43-59m 1976. 9 fig, 2 tab, 26 ref.

Descriptors: *Chlorophyll, *Carp, Productivity, Zooplankton, Nutrients, Hydrogen ion concentration, Seasonal, Phytoplankton, Ecology, Fertilizers, Fish management, Number fish per acre, Fish farming, Photosynthesis, Aquiculture, Fish ponds.

Ten fishponds were chosen from Chupei Fishery Institute to study the relationship among the amount of chlorophyll, zooplankton, gross production, and environmental factors. In July these ponds were stocked with fry of silver carp, common carp, grass carp, bighead, and crucian carp. Except two control ponds, the other eight ponds were treated with different fertilizers. From July through October, water samples were taken biweekly for the measurements of various variables. The seasonal variation of chlorophyll, gross production, zooplankton abundance, pH and water trasnparency were presented. All the variable studied showd no consistent seasonal pattern among the ten fishponds. The variations existed even between ponds with similar treatment. Whereas the variation of gross production, zooplankton abundance, pH and water transparency were all closely related to the amount of chlorophyll concentration. The mean coefficient of determination suggest that 70% of the variation of transparency in the fishponds could be explained by the chlorphyll concentration. However, the present study failed to show the close relationship of the production of various species of fish on the gross production, chlorophyll cncentration and zooplankton abundance.

EXCHANGE OF HEAVY METALS IN ASCOPHYLLUM NODOSUM (L.) LE JOL. IN SITU BY MEANS OF TRANSPLANTING EXPERIMENTS,
Trondheim Univ. (Norway). Inst. of Marine Biochemistry.
S. Myklestad, I. Eide, and S. Melsom.
Environmental Pollution, Vol. 16, p 277-284, 1978. 2 fig, 5 tab, 12 ref.

Descriptors: *Path of pollutants, *Heavy metals, *Marine algae, *Plant physiology, *Absorption, On-site investigations, Marine plants, Algae, Growth stages, Biochemistry, Copper, Lead, Cadmium, Mercury, Water pollution effects, Aquatic plants, Zinc, Bioindicators.

Plants of Ascophylum nodosum were tranferred from a locality with high concentrations of heavy metals in the sea water (Eikhamrane) to a locality with low concentrations (Flak). The alga grew for five months at the new locality. The zinc, lead, cadmium ad mercury contents in newly-grown tips were found to approach those in the tips of the the native plants in Flak. Inthe older parts of the plants the zinc and mercury contents decreased somewhat but remained high during the period investigated. The results are discussed in terms of current theories of heavy metal exchange in brown algae.
W79-00955

THE EFFECT OF FENITROTHION ON REPRODUCTION OF A TELEOST FISH, CYPRINUS CARPIO COMMUNIS LINN: A BIOCHEMICAL STUDY,
Punjab Agricultural Univ., Ludhiana (India). Dept of Zoology and Entomology.
K. Kapur, K. Kamaldeep, and H. S. Toor.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p 438- 442, 1978. 1 tab, 11 ref.

Descriptors: *Fish reproduction, *Enzymes, *Biochemistry, *Pesticide toxicity, *Carp, Fish physiology, Animal metabolism, Pesticide residues, Pesticides, Toxicity, Animal pathology, Fish diseases, Path of pollutants, Water pollution effects, Growth stages, Inhibition, Inhibitors, Chemical properties, *Fenitrothion, Tissue analysis.

The level of 3 beta-HSD, along with that of various other steroid dehydrogenases is indicative of steroidogenesis in the gonadal tissue. It was demostrated that treatment with fenitrothion caused a great reduction in the activity of 3 beta-HSD in testicular and ovarian extracts fron carp. It was suggested that the action of fenitrothion on the gonads may be either by inhibition of the adenylcyclase enzyme or the inhibition of RNA and protein sysnthesis.

LACK OF EFFECT OF INGESTED FORTIES FIELD CRUDE OIL ON AVIAN GROWTH,
Aberdeen Univ. (Scotland). Dept. of Zoology.
M. L. Gorman, and C. E. Simms.
Marine Pollution Bulletin, Vol 9, p 273-276, 1978. 6 fig, 1 tab, 4 ref.

Descriptors: *Oil, *Growth rates, *Gulls, *Toxicity, Oil spills, Oil pollution, Water pollution effects, Animal physiology, Animal metabolism, Uptake, Amino acids, Proteins, Immature growth stages, Organic compounds, *Crude oil, *Tissue analysis, Kuwait crude, Louisiana crude.

The reported cessation of growth by young herring gulls dosed with Kuwait and Louisiana crude oil was not observed when chicks of herring gull and other birds were dosed with Forties crude oil from the North Sea. One reason for this discrepancy is thought to be that the former birds may already have completed their growth at the time of the experiments. (EIS-Deal) or development is recommended. This process advocates the full and effective use of the communication media to ensure that the plan would be developed and implemeted in consultation with all those affected. Second, the goals and objectives of the plan should be clearly stated and the means for implementing these measures should be delineated. The goals listed are the improvement of economic productivity; the overall improvement of environmetal quality through conservation; and the improvement of the quality of life of low income groups in waterfront areas. Third, the goals are operationalized and translated into specific policy recommendations for various functional areas of waterfront such as shellfish preservation, enlargement of parks and marinas, flood and storm damage control, water quality and others. An inventory of existing resources and uses in investigated in depth to provide a sound basis for the adoption of these plans.
W79-00957

A TOXICOLOGICAL EVALUATION OF A PLASTIC OIL ABSORBANT,
Tromso Univ. (Norway). Inst. of Biology and Geology.
S. Lonning, and B. E. Hagstrom.
Marine Pollution Bulletin, Vol. 9, p 276-278, 1978. 2 tab, 7 ref.

Descriptors: Oil, *Oil spills, *Dispersion, *Toxicity, Oil pollution, Organic compounds, Chemical analysis, Plastics, Animal physiology, Reproduction, Embryonic growth stage, Fish physiology, Larval growth stage, Copepods, *Crude oil, *Dispersants, *Sea urchin.

The effect of a plastic oil absorbant was tested on several different test organisms of different taxonomic positions. The results indicate that the Oil Killer under the experimental conditions described, acts as an almost inert nontoxic substance. The Oil effects were recorded. In combination with crude oil the Oil Killer seems to reduce the serious ill effects exerted by oil alone.

ACUTE TOXICITY OF COPPER TO A COPEPOD,
Athens Univ. (Greece). Zoological Lab. and Museum.
M. Moraitou-Apostolopoulou.
Marine Pollution Bulletin, Vol. 9, p 278-280, 1978. 1 fig, 1 tab, 20 ref.

Descriptors: *Copepods, *Toxicity, *Copper, *Adaptation, Bioassay, Industrial wastes, Domestic wastes, Metals, Resistance, Animal populations, Water pollution effects, Zooplankton, Genetics.

The acute toxicity of copper to the marine copepod Acartia clausi was determined by means of static bioassays. Natural copepod assemblages from two different locations, one from an area polluted with industrial effluents and domestic wastes and another from a relatively uncontaminated area, were compared. Results of metal toxicity tests expressed as 48 h LC50 values indicate a significant difference in the tolerance of copper between the two populations, with the LC50 of the pollution-adapted population higher than that of the population from the uncontaminated area. (EIS-Deal)
W79-00959

THE EFFECTS OF ARSENATE AND ARSENITE ON THE GROWTH AND MORPHOLOGY OF THE MARINE UNICELLULAR ALGAE TETRASELMIS CHUI (CHLOROPHYTA) AND HYMENOMONAS CARTERAE (CHRYSOPHYTA),
Texas A and M Univ., College Station. Dept. of Biology.
N. R. Bottino.
Journal of Experimental Marine Biology and Ecology, Vol. 33, p 153-168, 1978. 13 fig, 12 ref.

Descriptors: *Phytoplankton, *Arsenic compounds, Toxicity, Growth rates, Cytological studies, Absorption, Metabolism, Membrane processes, Salinity, Resistance, Algae, Radioactivity, Techniques, Tracers, *Arsenate, *Arsenite, Mutagens.

The marine phytoplankton algae, Tetraselmis chui and Hymenomonas carterae, were grown in media containing various concentrations of arsenate or arsenite. The effects of arsenic on the algae varied with the oxidation state of the element, its concentration, and the degree of illumination. Arsenate affected mainly algal growth but also cell morphology, whereas arsenite caused only morphological changes. Studies on the incorporation of 74As-arsenate into cells grown in artificial sea water indicated that arsenate was incorporated and later partially released by both T. chui and H. carterae. Both arsenate influx and efflux seemed to be energy-dependent phenomena, because they varied with the degree of illumination. Differences between the rates of uptake and release of arsenic suggested that arsenate undergoes chemical changes after having been transported into the algal cells. (EIS-Deal)

DOUNREAY OIL SPILL: MAJOR IMPLICATIONS OF A MINOR INCIDENT,
Leeds Univ. (England). Wellcome Marine Lab.
R. S. Bowman.
Marine Pollution Bulletin, Vol. 9, p 269-273, 1978. 2 fig, 11 ref.

Descriptors: *Oil, *Oil spills, *Oil pollution, *Shores, Water pollution sources, Organic compounds, Baseline studies, Beaches, Dispersion, Birds, Water pollution effects, Mortality, Toxicity, Tides, *Dispersants.

Few reports of oil spills on an exposed rocky shore have taken into account the background of natural events and the period over which the possible consequences of pollution and its treatment may come to light. This small incident has served as a cautionary tale, illustrating the pitfalls of instant assessment, and the type of baseline experience required for biological interpretation. It has also underlined the continuing inadequacy of the ecological advice available when treatment decisions have to be made. (EIS-Deal)

TOLERANCE TO LEAD IN THE FRESHWATER ISOPOD ASELLUS AQUATICUS,
Nottingham Univ. (England). Dept. of Genetics.
J. Fraser, D. T. Parkin, and E. Verspoor.
Water Research, Vol. 12, p 637-641, 1978. 2 fig, 3 tab, 13 ref.

Descriptors: *Lead, *Adaptation, *Resistance, *Isopods, Crustaceans, Absorption, Genetics, Size, Toxicity, Heavy metals, Water pollution effects, Path of pollutants, Mortality, Animal physiology, Animal metabolism, Enzymes, Animal populations, Evolution, *Asellus.

Samples of the freshwater crustaceans Asellus aquaticus were taken from three sites in the River Trent basin, subjected to different amounts of lead pollution. The survival rate of large and small animals were compared experimentally in a series of different concentrations of lead. Differential survival was recorded between the size classes and the sites that could be explained in terms of genetic adaptation. The significance of the results is discussed in terms of adaptation to environmental pollution. (EIS-Deal)
W79-00962

INDIVIDUAL AND COMBINED TOXICITY OF SOME PETROLEUM AROMATICS TO THE MARINE AMPHIPOD ELASMOPUS PECTENICRUS,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
W. Y. Lee, and J. A. C. Nicol.
Marine Biology, Vol. 48, p 215-222, 1978. 1 fig., 6 tab., 28 ref.

Descriptors: *Toxicity, *Aromatic compounds, Oil, *Amphipoda, Fuels, Organic compounds, Mortality, Animal physiology, Animal metabolism, Bioassay, Water pollution effects, Chemical properties.

Toxicity of 4 compounds of petroleum oilsto the marine amphipod Elasmopus pectenicrus has been assessed. Two ephemeral aromatic hydrocarbons, naphtahalene (A) and 1,2,4-trimethylbenzene (B) were more toxic than two persistent aromatics, o-cresol (C) and 0-toluidine (D). The acute toxicity concentrations obtained for individual aromatic compounds were always greater than the actual concentrations found in the water-soluble fractions (WSF) of fuel oils. Results from mixtures of2 or more components indicated that the LC50 levels were primarily determined by the more toxic substances, A and B. Naphthalene and 1,2,4-trimethylbenzene became more toxic to the E. pectenicrus when present in a mixture of more than 2 components, and the toxicity increased with increasing numbers of components present. Synergistic effects, therefore, possibly occur in the whole WSF. No antagonistic effects were observed among the 4 petroleum aromatics.

THE EFFECTS OF DEPRESSED PH ON SPERMATOGENESIS IN FLAGFISH JORDANELLA FLORIDAE,
Sir George Williams Univ., Montreal (Quebec). Dept. of Biological Sciences.
S. M. Ruby, J. Aczel, and G. R. Craig.
Water Research, Vol. 12, p 621-626, 1978. 6 fig, 4 tab, 15 ref.

Descriptors: *Hydrogen ion concentration, *Fish reproduction, *Water chemistry, Cytological studies, Toxicity, Fish physiology, Animal metabolism, Fish eggs, Fish populations, Water quality, Industrial wastes, Air pollution effects, *Flagfish, *Jordanella, Tissue analysis, *Spermatogenesis.

Mature male flagfish Jordanella floridae were continuously exposed to lake water with depressed pH levels of 6.0, 5.5, 5.0, and 4.5 during a 20 day period at 25C. Quantitative histological analysis based upon the final stage of spermatogenesis prior to sperm formation indicated that the production of mature sperm was reduced at all pH values tested by 24.03, 27.03, 37.28 and 35.29% respectively when compared with the control at pH 6.7. Total volume of reproductive tissue relative to somatic tissue within the testes showed similar declines compared to the control. The general decline in spermatogenesis was confirmed morphologically by increased occurrence of tubules devoid of sperm and was particularly evident at pH 4.5. Comparison of the present results with data from female ovaries of the same experiment suggests a higher sensitivity of developing eggs to declining pH when compared with developing sperm. (EIS-Deal)

ASPECTS OF THE ECOLOGY OF PRYMNESIUM PARVUM (HAPTOPHYTA) AND WATER CHEMISTRY IN THE NORFOLK BROADS, ENGLAND,
University of East Anglia, Norwich (England). School of Environmental Sciences.
P. A. Holdway, R. A. Watson, and B. Moss.
Freshwater Biology, Vol. 8, p. 295-311, 1978. 9 fig, 2 tab, 48 ref.

Descriptors: *Phytoplankton, *Fish diseases, *Water chemistry, *Salinity, *Eutrophication, Fishkill, Mortality, Toxicity, Fish physiology, Water quality, Water analysis, Cytological studies, Nitrates, Phosphorus, Nutrients, Chlorophyll, Seasonal, *Prymnesium, River Thurne, Norfolk Broads (England).

Prymnesium parvum, an ichthyotoxic phytoplankter, has been recorded, at times abundantly, in the River Thurne, Norfolk, and its associated Broads. Its occurrence has been apparently more frequent and its polpulation sizes probably larger since the late 1960s than previously and fish mortalities due to it now occur almost annually. The Thurne system is brackish and may have become more so in recent years, exploitation by drainage pumps of a saline water table. Evidence for this is conflicting, but in any case an increase in salinity is unlikely to have made increased Prymnesium growth more likely. Eutrophication of some Broads in the system is most likely to have increased the populations of Prymnesium since the late 1960s. Data are presented on the present water chemistry of the system for comparison with previous records, and on current phytoplankton and Prymnesium crops in different parts of it. EIS-Katz)

CHRONIC SUBLETHAL EFFECTS OF THE WATER SOLUBLE FRACTIONS OF NO. 2

FUEL OILS ON THE MARINE ISOPOD, SPHAEROMA QUADRIDENTATUM,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
W. Y. Lee.
Marine Environmental Research Vol. 1, p 5-17, 1978. 4 tab., 25 ref.

Descriptors: *Toxicity, *Oil, *Fuels, *Isopods, Oil pollution, Oil spills, Organic compounds, Reproduction, Fecundity, Growth rates, Mortality, Aquatic population, Water pollution effects, Chemical properties, Juvenile growth stage, Animal physiology, Animal metabolism, *Water-soluble fractions, *Sublethal effects, Chronic effects.

Two series of experiments were carried out to assess the long-term effects of the water soluble fractions (WSF) of Fuel oils on the marine isopod, Sphaeroma quadridentatum. In one experiment, juvenile isopods (one month old) were exposed to sublethal concentrations of a fuel oil room temperatures of 24 plus or minus 1.6 C for nine months. These isopods survived to maturity and reproduced. However, growth rate was adversely affected at concentration greater than or equal to 3% WSF and fecundity was depressed at concentrations grater than or equal to 1% WSF. Survival of offspring in clean seawater was dependent to a large extent on the history of the previous generation. In another experiment, adult Sphaeroma (three months old) were subjected to the WSFs of four fuels oils for one month. Fecundity was depressed at a concentration greater than 15% WSF, regardless of the kind of fuel oil. On the other hand, the number of young produced by the surviving females varied with the type of fuel oil for the same level of WSF. This may be attributed to different relative amounts of toxic components present in the WSF. (EIS-Deal)
W79-00966

PETROLEUM HYDROCARBON RESISTANCE IN THE MARINE WORM NEANTHES ARENACEODENTATA (POLYCHAETA: ANNELIDA), INDUCED BY CHRONIC EXPOSURE TO NO. 2 FUEL OIL,
Texas A and M Univ., College Station. Dept. of Biology.
S. S. Rossi, and J. W. Anderson.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, No. 4, p 513-521, 1978. 2 fig, 2 tab, 20 ref.

Descriptors: Oil, *Fuels, *Annelids, *Resistance, *Oil pollution, Oil spills, Organic compound, Toxicity, Larval growth stage, Juvenile growth stage, Bioassay, Genetics, Animal metabolism, Animal physiology, Membrane processes, Radioactivity techniques, Tracers, Carbon radioisotopes, *Polychaetes, *Crude oil, Water-soluble fraction, *Neanthes, *Naphthalenes.

Three successive generations of the marine polychaetous annelid Neanthes arenaceodentata taken from a laboratory population, were continuously exposed to one of three sub-lethal concentrations of No. 2 fuel oil water-soluble-fractions (WSFs). During each generation larvae, juvenile, and immature adult polychaetes were challenged with acute (96 h) doses of No. 2 Fuel Oil or south Louisiana crude oil WSF to test their sensitivity to petroleum hydrocarbons (PHCs). Larvae from all 3 generations, at all exposure concentrations, were no different from control (susceptible) larvae in their sensitivity to the two test oils. F1, F2, and F3 adults exhibited equally increased PHC resistance (x2) compared to control adults. The only evidence of increased resistance beyond that observed in F1 animals, was seen in results of bioassays with juvenile worms, wherein PHC resistance increased from slightly below control levels in F1 juveniles to slightly above control tolerance among F3 juveniles. (EIS-Deal)
W79-00967

SALINITY AND TEMPERATURE TOLERANCE BY NYMPHON GRACILE (LEACH) AND ACHELIA ECHINATA (HODGE) (PYCNOGONIDA),
University Coll. of Swansea (Wales). Dept.of Zoology.
A. S. N. El-Hawawi, and P. E. King.
Journal of Experimental Marine Biology and Ecology, Vol. 33, p 213-221, 1978. 8 fig, 12 ref.

Descriptors: *Salinity, *Water temperature, Resistance, Humidity, Littoral, Animal physiology, Animal Metabolism, Toxicity, Mortality, Seasonal, Habitats, Salt tolerance, *Pycnogonid, *Nymphon, *Achelia.

The tolerance of two species of pycnogonid, Achelia echinata and Nymphon gracile to a range of salinities, temperatures, and relative humidities has been examined. In most instances, No. gracile is more resistant than A. echinata and indeed is found higher in the littoral zone during the warmer summer months and thus likely to be subjected to greater environmental fluctuation. (EIS-Deal)

INFLUENCE OF DOMESTIC WASTES ON ENERGETIC PATHWAYS IN ROCKY INTERTIDAL COMMUNITIES,
California Univ., Irvine. Dept. of Ecology and Evolutionary Biology.
M. M. Littler, and S. N. Murray.
Journal of Applied Ecology, Vol. 15, p 583-595, 1978. 2 fig, 3 tab, 15 ref.

Descriptors: *Productivity, *Energy, *Intertidal area, *Growth rates, *Reproduction, *Nutrients, Biological communities, Domestic wastes, Sewage effluents, Cyanophyta, Bacteria, Aquatic habitat, Trophic level, Water pollution effects, Omnivores, Herbivores, Crustaceans, Mollusks, *Suspension feeders, *Tissue analysis.

The calorific contents of eighteen macroinvertebrates and thirty-six macrophytes were determined in an unpolluted rocky intertidal habitat and in a nearby polluted habitat. Much of the variation in the calorific values of macrophytes was related to life span. The algae that characterized the unpolluted community usually contained comparatively fewer calories per unit weight. These forms had relatively more structural tissues and hence allocated relatively less energy to rapid growth and reproduction. In the polluted habitat, fugitive or opportunistic algal species were more prevalent; these had more rapid growth rates and higher productivites and tended to have relatively high calorific contents. In nearly every case, macroinvertebrates populations exposed to domestic sewage had higher energy contents than did corresponding populations from the unpolluted habitat. Macroinvertebrates in the polluted habitat grazed greater proportions of blue-green algae and bacteria. Omnivores and suspension feeders in the polluted habitat appeared to utilize energy-rich compounds in the sewage effluent; this may explain the greater standing stocks of ominvores and suspension feeders in the peripheral regions of the outfall plume. A REVIEW OF THE BIOLOGY OF BRITISH NAIDIDAE (OLIGOCHAETA) WITH EMPHASIS ON THE LOTIC ENVIRONMENT,
University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
M. A. Learner, G. Lochhead, and B. D. Hughes.
Freshwater Biology, Vol. 8, p 357-375, 1978. 1 fig, 2 tab, 116 ref.

Descriptors: *Oligochaetes, *Lotic environment, Reproduction, Periphyton, Bioindicators, Food habits, Benthic fauna, Habitats, Bacteria, Aquatic habitats, Niches, Aquatic life, Aquatic populations, Animal behavior, *Bibliographies, *Reviews, *Naidids.

Naidids live in a wide range of aquatic habitats but are particularly important numerically as part of the benthic fauna of rivers with stony substrates. Major factors determining the distribution and abundance of naidid species are the nature of the substratum and the presence and kind of vegetation. Plants with a highly dissected form, a thick growth habit, and which permit the greatest periphyton development generally support the most abundant naidid populations. Naidids reproduce both asexually and sexually, the former method predominating for most of the year. In general, naidids are most abundant during the summer months when rates of growth and asexual reproduction are stimulated by higher temperatures and a plentiful supply of food. The response of naidid species to different kinds of pollution is varied but generally organic enrichment of rivers which have stony substrates results in a considerable (ten- to twenty-fold) increase in anidid abundance. The importance of Naidiae in relation to pollution surveillance of freshwater is discussed. (EIS-Deal)
W79-00971

ACUTE TOXICITY OF BROMOCHLORINATED SEAWATER TO SELECTED ESTUARINE ESTUARINE SPECIES WITH A COMPARISON TO CHLORINATED SEAWATER TOXICITY,
Virginia Inst. of Marine Sciences, Gloucester Point.
M. H. Roberts, Jr., and R. A. Gleeson.
Marine Environmental Research, Vol. 1, p 19-29, 1978. 3 fig, 1 tab, 23 ref.

Descriptors: *Sea water, *Toxicity, *Chlorination, *Bromine, Chlorine, Estuaries, Mortality, Oysters, Copepods, Lethal limit, Disinfection, Larval growth stage, Juvenile growth stage, Resistance, Atlantic menhaden, Hcemical properties, Ammonia, Chemical degradation, Animal physiology, Fish physiology, *Menidia, Crassostrea, Leiostomus, Palaemonetes, *Bromochlorinated seawater.

The acute toxicity of bromochlorinated estuarine water was determined for several estuarine organisms. The most sensitive species were oysters (Crassostrea virginica) (larvae and juveniles) and copepods (Arcatia tonsa) with 48-h LC50's of 0.10 to 0.21 mg/BrCl/liter. Palaemonetes pugio was most tolerant with a 96-h LC50 of 0.70 mg BrCl/liter. The fish species tested (Menidia menidia, Brevoortia tyrannus and Leiostomus xanthurus) all had a 96-h LC50 of 0.21-0.23 mg BrCl/liter. The BrCl toxicity data are compared with Cl2 toxicity data for the same species. When the LC50's are expressed as equivalents per liter, BrCl is found to be two to four times less toxic than Cl2. The ranking of species in terms of sensitivity is the same for both disinfectants. (EIS-Deal)

EFFECTS OF AERATION IN EARTHEN PONDS ON WATER QUALITY AND PRODUCTION OF WHITE CATFISH,
South Carolina Agricultural Experiment Station, Clemson.
H. A. Loyacano.
Aquaculture. 3(3), p 261-271, 1974.

Descriptors: Dissolved oxygen, Chemical oxygen demand, Air pollution effects, *Aeration, *Catfish, Food, Earthen ponds, Fish production, Water pollution effects, *White catfish.

Comparing effects of air volumes of 0, 6.9 and 10.4 m3/min/ha (0,100 and 150 ft3/min/acre) indicated that greater volumes of air resulted in increased fish production. Increased volumes of air resulted in proportionate increases in dissolved O2 content, allowing greater weights of food to be offered to fish without depleting the O2 content of the pond water. Chemical oxygen demand was inversely related to the volume of air delivered.--Copyright 1975, Biological Abstracts, Inc.

TOXICITY OF COPPER TO THREE ESTUARINE BIVALVES,
Centre of Advanced Study in Marine Biology Porot Novo (India).
A. K. Kumaraguru, and K. Ramamoorthi.
Marine Environmental Research, Vol 1, p 43-48, 1978. 3 tab, 12 ref.

Descriptors: *Copper, *Toxicity, Commercial shellfish, Bioassay, Animal physiology, Animal metabolism, Metals, Mortality, Resistance, Animal behavior, Water pollution effects, Lethal limit, *Static bioassay.

This paper reports on a study of the toxicity of copper to three species of bivalve of commercial food value, Anadara granosa, Meretrix casta, and Crassostrea madrasensis. The LC50 values were estimated as 60 microg Cu/liter for A. granosa, 72 microg Cu/liter, for M. casta, and 88 microg Cu/liter for C. madrasensis subjected to 96-h static bioassay tests after acclimation for a period of four days in the laboratory. The revival rates of bivalves which survived exposure to the LC50 concentrations for the 96-h period (when marked and released in the natural environment) were 67% for A. granosa, and C. madrasensis and 83% for M. casta. The LT50 values for the three bivalves at different concentrations of the metal were also calculated. (EIS-Deal)

ACUTE AND SUBLETHAL TOXICITY OF NAPHTHALENE AND THREE METHYLATED DERIVATIVES TO THE ESTUARINE COPEPOD, EURYTEMORA AFFINIS,
Marine Biological Association of the United Kingdom, Plymouth (England). Plymouth Lab.
F. S. Ott, R. P. Harris, and S. C. M. O'Hara.
Marine Environmental Research, Vol 1, p 49-58, 1978. 1 fig, 3 tab, 14 ref.

Descriptors: *Copepods, *Estuaries, *Toxicity, Organic compounds, Chemical properties, Mortality, Animal physiology, Animal metabolism, Reproduction, Fertility, Fecundity, Water pollution effects, Aromatic compounds, Growth stages, *Naphthalenes, Eurytemora, Methyl naphthalenes.

The bi-cyclic aromatic hydrocarbon naphthalene and its alkylated derivatives 2-methylnaphthalene, 2,6-dimethylnaphthalene, and 2,3,5-trimethylnaphthalene were used to investigate possible relationships between increased methylation and toxicity during acute high level and chronic low level exposure experiments using the calanoid copepod Eurytemora affinis. The 24-h LC50 levels indicated an approximate twofold increase in toxicity per methyl group addition. Low levels chronic exposure of E. affinis to the various naphthalenes in sea water concentrations of about 10 microg/liter for the duration of their adult life (maximum twenty-nine days) resulted in significant reductions in length of life, total numbers of nauplii produced and mean brood size. Exposure to all the naphthalenes at this level (approximately 10 microg/liter) resulted in reduced rates of egg production which were, on average, about 50% of those in control animals. Results are discussed in relation to previous work on the fate and effect of petroleum hydrocarbons in marine copepods. (EIS-Deal)

ENRICHMENT OF ESTUARINE PHYTOPLANKTON BY THE ADDITION OF DISSOLVED MANGANESE,
North Carolina Univ. at Chapel Hill. Marine Science Program.
J. G. Sanders.
Marine Environmental Research, Vol 1, p 59-66, 1978. 2 fig, 3 tab, 13 ref.

Descriptors: *Manganese, *Phytoplankton, *Nutrients, *Sewage effluents, *Dissolved oxygen, Estuaries, Effluents, Sewage disposal, Tidal effects, Absorption, Productivity, Water pollution effects, Growth rates, Biochemical oxygen demand, Algae, *Complexation.

The response of natural phytoplankton to additions of excess Mn in an estuary receiving sewage effluents varied with tidal amplitude. During periods of low tidal amplitude, when DOC concentrations were high, carbon uptake by phytoplankton was stimulated. When tidal amplitudes were relatively high, carbon uptake was not affected by Mn addition. The link between high DOC concentrations and stimulation suggests that the Mn addition either relieves a deficiency in available Mn caused by organic complexation or complexes organics from the sewage effluent which are otherwise harmful to phytoplankton productivity. Sewage effluent entering estuaries can be both beneficial and detrimental to the phytoplankton population. Productivity is increased by the addition of inorganic nutrients but may be depressed by the organics contained in the effluent. (EIS-Deal)

ACCUMULATION OF HEAVY METALS IN RAINBOW TROUT SALMO GAIRDNERI (RICHARDSON) MAINTAINED ON A DIET CONTAINING ACTIVATED SEWAGE SLUDGE,
University Coll., Cardiff (Wales). Dept. of Zoology.
S. M. Singh, and P. N. Ferns.
Journal of Fish Biology, Vol 13, p 277-286, 1978. 2 fig, 6 tab, 25 ref.

Descriptors: *Heavy metals, *Rainbow trout, *Absorption, *Sewage sludge, *Activated sludge, *Fish diets, Chromium, Manganese, Iron, Cobalt, Nickel, Copper, Zinc, Cadmium, Mercury, Metals, Laboratory tests, Aquiculture, Bioaccumulation.

Rainbow trout were fed for 10 weeks with a nutritionally balanced diet containing 30% by weight of activated sewage sludge. The whole body concentrations of nine heavy metals (Cr, Mn, Fe, Co, Ni, Cu, Zn, Cd, Pb), together with four major cations (Ca, Mg, Na, K) were determined at the beginning and end of the experiment and at three intermediate stages. Fish fed on the diet containing sewage sludge had significantly elevated levels of Cr, Fe, Ni, Pb and reduced levels of Na and K compared with controls, though the values obtained for all groups fell within the range reported for uncontaminated fish. The Ni and Zn showed a marked increase towards the end of the experiment, suggesting that they might have continued to rise after 70 days. (EIS-Katz)

MERCURY AND THE ESTUARINE MARSH CLAM, RANGIA CUNEATA GRAY. II. UPTAKE, TISSUE DISTRIBUTION, AND DEPURATION,
Texas A and M Univ., College Station. Dept. of Biology.
T. M. Dillon, and J. M. Neff.
Marine Environmental Research, Vol 1, p 67-77, 1978. 5 fig, 1 tab, 35 ref.

Descriptors: *Mercury, *Clams, Animal physiology, Animal metabolism, Path of pollutants, Heavy metals, Salinity, Estuaries, Absorption, Chemical reactions, Commercial shellfish, Tissue analysis, Bioaccumulation, *Depuration, Rangia, Marsh clam.

During a two-week period, Rangia rapidly accumulates mercury (as mercuric chloride) from dilute solution (0.03-0.05 ppm) with the majority being located in gill and mantle tissue. Initial depuration (5 h) in clean seawater is rapid in all tissues. From 10-192 h concentrations of mercury in gill, foot and adductor muscles remain stable while mantle, haemolymph, and viscera levels continue to fluctuate in a manner suggesting internal redistribution of mercury. After eight days of depuration, the viscera contains the most mercury and appears to be the only tissue to increase its proportionate share of the total tissue mercury. After fifteen weeks of depuration, residual mercury in whole clams is about 20% of initial concentrations. Acute decreases in salinity enhance Rangia's ability to depurate mercury. (EIS-Deal)

A KEROSENE-LIKE TAINT IN THE SEA MULLET MUGIL CEPHALUS (LINNEAUS) II. SOME ASPECTS OF THE DEPOSITION AND METABOLISM OF HYDROCARBONS IN MUSCLE TISSUE,
Queensland Dept. of Primary Industries, Hamilton (Australia).
D. W. Connell.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, No. 4, p 492-498, 1978. 3 fig, 4 ref.

Descriptors: Fish physiology, *Mullets, *Absorption, *Lipids, Path of pollutants, Animal metabolism, Organic compounds, Food webs, Chemical properties, Chemical analysis, Gas chromatography, Aromatic compounds, Biodegradation, Taste, Commercial fish, *Tissue analysis, *Alkanes.

The results obtained indicate that the deposition of absorbed hydrocarbons in different segments of the muscle tissue of the sea mullet is proportional to the lipid content of the segment. However, the results give no clear indication as to whether the total lipid content of the muscle tissue of individual fish influences the uptake of hydrocarbons for the environment. Evidence has been presented for different rates of metabolism of the n-alkanes as compared to the iso-alkanes and related compounds. Metabolic processes in the sea mullet result in the preferential degradation of the n-alkanes leaving a hydrocarbon mixture in the sea mullet enriched with iso-alkanes and related compounds. ELEOCHARIS ACICULARIS (L) R AND S: THE AUTECOLOGY OF AN ACID TOLERANT SEDGE,
Pennsylvania State Univ., University Park. Dept. of Biology.

P. E. Rothrock, and R. H. Wagner.
Castanea, Vol. 40, No. 4, p 279-289, December, 1975. 4 fig, 2 tab, 16 ref.

Descriptors: *Rooted aquatic plants, *Ecological distribution, Wetlands, *Acid polluted waters, *Eleocharis, Streams, Hydrogen ion concentration, Phosphorus, Carbon dioxide, Aquatic plants.

The sedge Eleocharis acicularis (L) R and S is a mat forming species found in acid polluted waters with pH as low as 2.85. Both terrestrial and submergent forms are known and were shown by reciprocal transplants to be genetically identical and freely interconvertible. The colonies tend to be in backwash areas where water current is mostly negligible and substrate texture is clay-silt. Mats buried under silt are capable of reestablishing themselves by internodal elongation in association with the production of new culms. Measurements of the chemical environment varied widely but phosphorus and CO2 levels were thought to be of possible importance. Reproduction is most often accomplished by asexual fragmentation but seeds, when produced, have a germination rate as high as 86%. (Stihler-Mass)

THE FRESH-WATER POLYCHAETE, MANAYUNKIA SPECIOSA, IN A THERMAL CHANNEL, CLEVELAND HARBOR LAKE ERIE.
Cleveland State Univ., OH. Dept. of Biology.
R. G. Rolan.
Am Midl Nat. 92(1), p 207-213, 1974.

Descriptors: *Lake Erie, Channels, Chlorination, Cleveland, Harbors, Lakes, Light, Manayunkia-speciosa, Ohio, Oxygen, *Polychaetes, Sediment, *Thermal pollution, Water pollution, Hydrogen ion concentration, *Worms.

Six specimens of the fresh-water polychaete, Manayunkia speciosa, wre collected in the Cleveland Harbor Ohio, area of Lake Erie in Sept. and Oct., 1970. Four were found in the inlet channel of the Cleveland Electric illuminating Company's Lakeshore power plant. Two were found in the discharge channel. This is the 1st known occurrence of this unusual worm in a thermal discharge area. Physical data included bottom temperature, dissolved O2, pH, light intensity, and sediment particle size distribution and organic content. Bottom temperatures in the discharge channel averaged 6C higher than in the inlet. Dissolved O2 was never lower than 5 ppm. Sediment in the inlet was predominantly very fine sand with a mean organic content of 8.65% while in the discharge channel the sediment was composed mostly of very fine sand, fine gravel and rocks. Its mean organic content was 7.18%. These data and information from other reports suggest that Manayunkia speciosa had broad tolerance limits for many of the factors commonly measured, such as temperature, dissolved O2, substrate texture and current velocity. It is also apparently able to withstand high levels of chlorination. Its apparent broad tolerance limits and high passive vagility contrast with its restricted distribution.--Copyright 1974, Biological Abstracts, Inc.

A NOTE ON THE EFFECT OF LOWERED TEMPERATURES ON THE SURVIVAL OF EGGS AND FRY OF THE GRASS CARP CTENOPHARYNGODON IDELLA (VALENCIENNES),
Ministry of Agriculture, Fisheries and Food, London (England). Salmon and Freshwater Fisheries Lab.
B. Stott, and D. G. Cross.
J Fish Biol. 5(6), p 649-658, 1973.

Descriptors: Austria, *Carp, Ctenopharyngodon-idella, Effluents, *Eggs, Fry, Grass, Lowered temperature, Powerplants, Seasonal, Spawning, *Survival, *Temperatures, United-Kingdom.

The grass carp has been introduced into many countries and yet self-sustaining populations are known at only 4 sites outside its natural range. While the hydrological conditions apparently necessary for spawning are unlikely to occur in the United Kingdom, the requirements of temperature and perhaps water speed occur locally in heated effluents from power stations. Since most heated effluents tend to layer on the water surface, grass carp eggs laid in effluents would quickly be exposed to falls in temperature of up to about 9C. Experiments carried out in Austria with newly fertilized eggs show that incubation temperatures below 20C result in large scale deaths and deformities which lead to death, although 20 h old fry are not adversely affected. Because summer river temperatures seldom exceed 20C, if spawning did occur it would be unsuccessful at most power station sites. At sites where the power station uses a considerable proportion of the available river flow and where the effluent mixes completely downstream, eggs could possibly survive if temperature were the major criterion for successful development.--Copyright 1974, Biological Abstracts, Inc.

FLOWS OF MATERIALS BETWEEN POORLY FLOODED TIDAL MARSHES AND ESTUARY,
Maryland Univ. Solomons, Chesapeake Biological Lab.
D. R. Heinle, and D. A. Flemer.
Marine Biology, Vol. 35, No. 4, p 359-373, April 30, 1976. 7 fig, 5 tab, 40 ref.

Descriptors: *Tidal marshes, *Cycling nutrients, Nutrients, Flooding, Detritus, Standing crops, Estuaries, Salt marshes, Patuxent estuary.

Flows of particulate carbon, nitrogen, phosphorus, chlorophyll a, crude fiber, carbohydrate, and adenosine tri-phosphate; and of dissolved nitrogen and phosphorus between a marsh and the patuxent estuary, Maryland, were measured over a 2-year period. Virtually no carbon was exchanged, while net flows of nitrogen and phosphorus were from the marsh to the estuary, principally in dissolved forms. Data suggest that fluxes of detritus from stable marshes subjected to modest amounts of tidal flooding are slight, amounting to less than 1% of the maximum areal standing crops.(Maroncelli-Mass)

IN SITU EXPERIMENTS ON THE DISSOLVED AND COLLOIDAL STATE OF IRON IN AN ACID BOG LAKE,
Michigan Univ., Ann Arbor. School of Natural Resources.
J. P. Koenigs.
Limnology and Oceanographic, Vol 21, No 5, p 674-683, Sept. 1975. 3 fig, 3 tab, 23 ref.

Descriptors: *Bogs, *Iron, *Chemical stratification, Wetlands, Michigan, Anaerobic conditions, Chemical reactions, Water properties, *Acid bog lakes, Ferrous organic complexes, Inorganic iron, North Gate(Michigan).

Inorganic, nonreactive spcies of iron FE (OH) 3, represent minor amounts of the total iron in North Gate lake, in contrast to lakes of pH 6-8. In situ radiochemical analyses revealed that colloidal reactive ferric iron predominates in the oxygenated epilimnion, while dialyzable or dissolved ferrous iron increases with depth. Unlike iron, organic matter is present in a nontransient colloidal state. in acid bog lakes, pH 4-5, ferric iron may be collaoidal not as an inorganic complex (OH(-)) but as reactive Fe (3+) by complexation with the colloidal organic acids. After thermally induced mixing with anaerobic waters, ferric iron is reduced and dissolved; however, some reactive iron remains colloidal, suggesting the presence of a residual ferrous iron complex. EVALUATION OF ULTRAVIOLET/OZONE TREATMENT OF ROCKY MOUNTAIN ARSENAL (RMA) GROUNDWATER (TREATABILITY STUDY),
Army Engineer Waterways Experiment Station, Vicksburg, MS.
R. E. Buhts, P. G. Malone, and D. W. Thompson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A052 339, Price codes: A03 in paper copy, A01 in microfiche. Technical Report Y-78-1, January 1978. 38 p, 12 tab, 6 ref, append.

Descriptors: *Chemical wastes, *Water pollution treatment, *Groundwater, *Ultraviolet radiation, *Ozone, Wastes, Colorado, Waste water treatment, *Rocky Mountain Arsenal(Colo), Waste disposal.

Rocky Mountain Arsenal (RMA) has been a chemical manufacturing and chemical demilitarization facility since 1942. Wastes from various chemical processes were discharged into unlined basins until construction of an asphalt-lined evaporation lake in 1955. Repeated contact of rainwater and groundwater with chemical wastes in and beneath the basins has resulted in transport of chemical compounds toward the boundaries of RMA. The groundwater at RMA is known to be contaminated with chlorinated hydrocarbons, organophosphorous, organosulfur, and other organic compounds. This investigation examined the use of ultraviolet/ozone (UV/O3) treatment to reduce the concentration of contaminants in RMA groundwater. Experimental results obtained from treating RMA groundwater with UV light and ozone are given. Two different batch reactors were used, and such parameters as ozone concentration, temperature, and wattage of UV light were varied. Continuous flow experiments were also conducted. In batch experiments, total organic carbon removal ranged from 40 to 90 percent. The concentrations of diisopropylmethylphosphonate (DIMP) and other organic compounds were significantly reduced. In the continuous flow phase of the study, it was possible to remove 93 percent of the DIMP originally present and lower the levels of all other organic contaminants to below detectable limits. (WES)

DEGRADATION OF UREA BY BACTERIA AND ALGAE IN MASS ALGAL CULTURES,
Warsaw Univ. (Poland), Dept. of Environmental Microbiology.
R. J. Chrost, J. Owczarek, and K. Mtusiak.

Acta Microbiologica Polonica, Vol. 7, No. 4, 1975, p 231r236. 4 tab, 14 ref.

Descriptors: *Urea, *Urease, *Bacteria, *Waste water treatment, *Chlorella vulgaris, *Degradation(Decomposition), Algae, Industrial wastes, Fertilizers, Nutrient removal, Beneficial use, Enzymes, Tertiary treatment, Metabolites, Hydrolysis, Biological treatment.

An investigation in which the alga Chlorella vulgaris and accompanying bacteria was used to study the role of urease in urea hydrolysis in nitrogen fertilizer plant wastewater showed no presence of the enzyme in this strain of the alga, but did however demonstrate the importance of urease-containing bacteria in urea removal. Relatively high urea assimilation during initial states of the algal culture appears due to bacterial participation. Urea-hydrolyzing bacteria were subsequently eliminated from the algal culture by algal metabolites, resulting in diminished urea uptake from treated wastes. No changes in pH of the growth medium were observed. No urease activity was found in either intact or sonicated C. vulgaris cells. It can be assumed that this alga strain degrades urea by a process other than hydrolysis. Chemical analyses showed an increase in ammonia with time in the algal culture. Unicellular algae are useful in fertilizer industry wastewater treatment because of their short generation time, small sensitivity to pH changes, and high ability to remove nitrogen loads. In these tests C. vulgaris was maintained in a continuous culture on wastewater containing 1169 mg N/liter as urea. Bacterial composition was observed to change from domination by gram-positive bacteria to domination by gram-negative bacteria. (Lynch-Wisconsin)

PLANNING AND INSTITUTIONAL CONSIDERATIONS IN WASTEWATER TREATMENT FACILITIES PLANNING, BOSTON, MASSACHUSETTS. PHASE 1 STUDY,
Urban Systems Research and Engineering, Inc., Cambridge, MA.
C. Binkley, J. Hudson, and R. Tabors.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 576, Price codes: A10 in paper copy, A01 in microfiche. Prepared for Council on Environmental Quality, Washington, D.C. Final Report. July 16, 1976, 149 p, 47 tab. EQ6AD451.

Descriptors: *Waste water treatment, *Waste water treatment facilities, Water pollution, *Water quality standards, *Water supply, *Water quality, *Planning, Air quality, Water supply, Recreation, Transportation, Costs, Environmental effects, Land use, *Boston(MA), Municipal debt, *Federal Water Pollution Control Act Amendments, Data collection, Coastal zone management, Population projections.

This report covers Phase 1 of a comprehensive case study of the effectiveness of planning for municipal wastewater treatment facilities construction grants under the FWPCA Amendments of 1972. It presents baseline data and an investigation of relevant issues for analyzing the problems of administering a national wastewater treatment program. The study area, around Boston, MA, lies south of the northern extension of BOSWASH conurbation which extends from Norfolk, VA to Lowell, MA. The first part of the report covers the institutional setting for wastewater management in the study area, consisting of state agencies, regional sewer agencies, the Metropolitan Area Planning Council, and the relevant planning bodies in cities and towns. Definitions of the study area are offered with the implications each definition has for wastewater management. Definition by political boundary, sewered areas, or by river basins all offer special problems when assessing the best method for wastewater management. The existing and proposed facilities are discussed but data limitations restricted the scope of the analysis. Existing land use patterns and population projections for the study area are offered and it is noted that two major regional wastewater studies project significantly different figures for population growth and dispersement. The report stresses the need for consistency and for placing the facility construction plans ahead of areawide wastewater management plans. The final chapter discusses the problems of financing necessary water pollution abatement expenditures. The appendices list data sources, bibliography, records of interviews and a glossary of acronyms used. (Coan-NC)

FACILITIES PLAN ADMINISTRATIVE REPORT FOR LEAD-DEADWOOD, SANITARY DISTRICT NO. 1, DEADWOOD, SOUTH DAKOTA.
CH2M Hill, Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 134, Price codes: A15 in paper copy, A01 in microfiche. May 1976. 328 p, 10 fig, 7 tab.

Descriptors: *South Dakota, *Pollution abatement, *Water quality, Sewage treatment, Cities, Constraints, Environment, Facilities, Waste water treatment, Surveys, Project planning, *Lead(SD), *Deadwood(SD).

The plan study consisted of 4 parts: an administrative report presenting the selected waste water management system, with background, alternatives, and basic issues; a technical report for environmental assessment, documenting the steps and decisions evolved; the environmental assessment of the proposed project; and detailed background materials with task reports developed during the planning procedure, supporting the issues and conclusions. A distinction was made between water quality objectives, standards or criteria, and limitations. (Froehlich-ISWS)
W79-00707

PURIFICATION OF AQUEOUS WASTE FROM INITIAL TREATMENT OF WOOL - BY ALLOWING WASTE TO SETTLE, TREATING WITH POLYELECTROLYTES, AND REINTRODUCING SEPARATED DEPOSIT BEFORE FINAL SEPARATION PROCESS.
Soviet Patent SU-558-870. Issued December 12, 1977. Derwent Soviet Inventions Illustrated, Vol. A, No. 32, p 6, September, 1978.

Descriptors: *Patents, *Textile wastes, *Oily water, *Flocculation, *Industrial wastes, Separation techniques, Sedimentation rates, Waste water treatment.

A patent has been granted for a method to treat waste water from the initial stages of wool processing. The process involves settling, treatment with a mixture of polyelectrolytes, and further settling for 24 hrs to separate wool grease and dirt residues. The process is improved by reintroducing the residue into the purified water at a volumetric ratio of 1:1-1.5, stirring the mixture for 2-2.5 hrs, and allowing the mixture to settle again. When the process was applied to 20 liters of separated residue added to an equal volume of purified water, wool fat removal increased from 80 to 93.6% and sulphonal removal from 63 to 78.4%. (Schulz-FIRL)
W79-00727

TREATMENT OF DYEING EFFLUENTS - BY OXYGENATION, ELECTROLYSIS FLOCCULATION, SEPARATION AND FILTRATION, TO YIELD A SOLVENT SUITABLE FOR FURTHER DYEING.
French Patent FR 2368-567. Issued June 23, 1978. Derwent French Patents Abstracts, Vol. A, No. 29, p 4, August, 1978.

Descriptors: *Recycling, *Patents, *Dyes, *Textiles, *Water reuse, *Electrolysis, Flocculation, Industrial wastes, Chemical wastes, Effluents, Waste water treatment, Oxygenation, Separation techniques.

A patent has been issued for an aqueous dyebath solvent formed from effluents of previous dyeing processes. The solvent improves dye quality, reduces wastage, and allows for textile dyeing in a closed circuit to alleviate effluent disposal problems. After oxygenation, effluent collected from previous dyeing is passed to an electrolysis vat where an electric current is fed to a soluble metal anode. This forms a flocculent metal hydroxide which adsorbs impurities from effluent. A decantation filter is used to separate the flocs from the aqueous solvent before replenishment with fresh dyes. (Schulz-FIRL)
W79-00728

PROPYLAMMONIUM HALIDE STARCH DERIVATIVES - USED AS FLOCCULANTS, AND IN TEXTILE AND PAPER INDUSTRIES.
German Patent DS-2055-046. Issued August 3, 1978. Derwent German Patents Abstracts, Vol. A, No. 32, p 2, September, 1978.

Descriptors: *Flocculation, *Chemical reactions, *Pulp and paper industry, *Patents, *Textile wastes, Separation techniques, Industrial wastes, Waste water treatment, Organic compounds.

A patent has been issued for a process to prepare propylammonium halide starch derivatives to be used as flocculating agents in waste water treatment for the textile finishing and paper processing industries. The cation active derivatives are prepared by reaction of starch with quarternary 3-halogeno-2-hydroxypropylammonium halides or the corresponding epoxides in an alkaline medium. The reaction is especially conducted with tertiary amines containing alkyl, alkenyl, aryl or aralkyl groups and halogenohydrins; this is followed by treatment with hydrogen halides and optional conversion to the epoxides. (Schulz-FIRL)
W79-00729

REMOVING FLUORIDE FROM WASTE WATER BY ADDING CALCIUM AND PHOSPHATE - AND PRECIPITATING GERMS OF FLUOR:APATITE OR CALCIUM FLUORIDE.
Netherlands Patent NL-7800-830. Issued July 26, 1978. Derwent Netherlands Patents Report, Vol. A, No. 32, p 4, September, 1978.

Descriptors: *Patents, *Fluorides, *Chemical precipitation, *Chemical wastes, *Industrial wastes, Separation techniques, Waste water treatment, Calcium.

A patent has been granted for a continuous treatement process for waste water from the manufacture of phosphates, fluoroborates, fluoride, fluorine, and fluorosilicates. A calcium compound is added to the waste water stream to provide a molar ratio of calcium to fluoride of at least 5.0. A phosphate compound is added concurrently to maintain a pH of 6.0-11.5. Fluoroapatite and/or calcium fluoride are added as precipitating agents which act to crystallize the fluoride from the continuous stream of waste water. The process is reported to yield residual fluoride concentrations of less than 0.1 ppm, a value considerably lower than the 4.0 to more than 10 ppm obtained by conventional methods. (Schulz-FIRL)

INSTALLATION FOR THE MECHANICAL-BIOLOGICAL PURIFICATION OF WASTE WATER,
Mecafina SA, Schmerikon (Switzerland). (Assignee).
E. Fuchs.
U.S. Patent No. 4,090,965, 13 p, 15 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 970, No 4, p 1424-1425, May 23, 1978.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water purification, Water pollution treatment, *Biological treatment, Filtration, Equipment.

An installation for the mechanical-biological purification of waste water or sewage incorporates at least one biological stage and one post-clarification stage, the post-clarification stage incorporating a filter. The filter is a drum filter having a filter surface at the inflow or deposit side of it. A suction nozzle extends transversely with respect to the direction of relative movement between the filter surface and the suction nozzle. (Sinha-OEIS)
W79-00825

WASTE WATER PURIFICATION SYSTEM,
The Redux Corp., St. Louis, MO. (Assignee).
T. N. Deane.
U.S. Patent No. 4,092,242, 6 p, 1 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 970, No 5, p 1855, May 30, 1978.

Descriptors: *Patents, *Waste water treatment, *Water purification, *Water pollution treatment, Detergents, Water reuse, Emulsifiers, Flocculation, Separation techniques.

Waste water containing synthetic detergents (syndets) such as water soluble sulfonates or ethoxylated alcohols is reclaimed for re-use by emulsifying with a water insoluble, high molecular weight, anionic surface active oil, then breaking the emulsion by conventional physical or chemical methods, thereby producing a coherent floc which occludes the syndet and all insoluble matter suspended in the water, then separating the floc from the purified water in a coherent mass. (Sinha-OEIS)
W79-00831

SEWAGE TREATMENT DEVICE,
Commanche Engineering Corp., Rockwell City, IA. (Assignee).
D. La Gatta.
U.S. Patent No. 4,092,249, 6 p, 7 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 970, No 5, p 1859, May 30, 1978.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Aerobic treatment, Aerobic conditions, Oxygen, Mixing, Septic tanks.

A septic tank is described which permits aerobic breakdown of the sewage, but which does not utilize an air compressor. Instead, the invention utilizes a three compartment tank which permits the sewage to move progressively from a first, to a second, to a third compartment, and which provides for recirculation of the fluid back from the third compartment into the second compartment. When recirculated, the fluid is sprayed into the second compartment which has a vented air chamber above the fluid level. By spraying the fluid into this second compartment, the invention permits the exposure of the fluid to oxygen and causes agitation of the fluid within the second compartment. The sprays are directed in such a manner so as to create a circular agitation motion thereby maintaining many of the solid materials in suspension within the fluid. This permits a more thorough and complete breakdown of the fluids. (Sinha-OEIS)

Ahlstrom (A.) Osakeyhtio, Helsinki (Finland).
K. O. Henricson.
U.S. Patent No. 4,093,508, 6 p, 2 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 971, No 1, p 264, June 6, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Bleaching wastes, Separation techniques, Industrial water, Water reuse, Cellulose, *Chemicals recovery.

The invention relates to a process for the recovery and reuse of sodium and sulfur chemicals in connection with sulfate cellulose production, whereby the chlorine chemicals are simultaneously removed from the liquor system in the form of sodium chloride. It is possible to use the waste water flow from the bleaching apparatus either entirely or partially for washing the digestion chemicals from cellulose. Besides, the waste flow can be used for dissolving the melt coming from the soda-ash roaster. Or the waste water coming from the bleaching apparatus can be used instead of condensation water and clean water at several other stages of the recovery system for digestion chemicals. In the recovery system a melt from a soda-ash roaster, mainly containing sodium sulfide and sodium carbonate, but also sodium chloride is dissolved and clarified to produce a green liquor containing carbonate sulfide and chlorides. The carbonate is separated from the sulfide and the chlorides then at least part of the sodium chloride is separated from the sulfide in solution, at least part of the carbonate is causticized into hydroxide, and the hydroxide and sulfide in solutions are mixed together in a ratio suitable to form a digestion solution with the desired sulfide content. (Sinha-OEIS)
W79-00837

PREPARATION OF LIQUID FUEL AND NUTRIENTS FROM MUNICIPAL WASTE WATER,
J. L. Lang.
U.S. Patent No. 4,093,516, 5 p, 1 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 971, No 1, p 266, June 6, 1978.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Organic wastes, Fermentation, Separation techniques, Fuels, Ultimate disposal.

An ultimate disposal method for municipal waste, i.e. sewage, to produce useful products comprises the combined steps of separation, either simultaneously or consecutively with a chosen concentration step, of the solid components of the municipal waste, followed by microbial conversion of the soluble contaminants. It is followed by conversion of the separated solid components to a fermentable mixture, fermentation, and separation of the end products of the fermentation to produce a valuable nutrient fraction and a valuable fuel fraction, usable, e.g. as fuel for an internal combustion engine, and purified water. (Sinha-OEIS)
W79-00838

ACTIVATED SLUDGE TREATMENT OF WASTEWATER,
Autotrol Corp., Milwaukee, WI. (Assignee).
C. F. Guarino.
U.S. Patent No. 4,093,539, 7 p, 3 fig, 5 ref; Official Gazette of the United Stages Patent Office, Vol 971, No 1, p 274, June 6, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Biological treatment, Activated sludge, Aeration, Equipment.

A method for operating an activated sludge wastewater treatment plant utilizes rotating contactors that are partially submerged in the wastewater in the aeration tank of the activated sludge plant. The rotating contactors provide a fixed film media for the growth of biological life that is present in the recycled activated sludge. The result is a more active biological coating on the fixed film media than is found on such media when used as a separate secondary treatment. In the preferred embodiment, the energy to rotate the contactors is supplied by the same compressed gas that is normally introduced below the surface of the wastewater in the aeration tank of the conventional activated sludge system. (Sinha-OEIS)
W79-00839

METHOD OF THE REMOVAL OF METALLIC MERCURY,
Tecneco, S.p.A., Fano (Italy). (Assignee).
C. Piccinini, and V. Conti.
U.S. Patent No. 4,093,541, 2 p, 1 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 971, No 1, p 274, June 6, 1978.

Descriptors: *Patents, *Waste water treatment, Industrial wastes, Water pollution treatment, *Mercury recovery, Separation techniques, Activated carbon.

A method is disclosed for removing metallic mercury from industrial sewage waters. The improvement is that the polluted liquors are treated with activated carbon having a high specific surface. (Sinha-OEIS)
W79-00840

METHOD AND APPARATUS FOR AMMONIA-NITROGEN REMOVAL BY VACUUM DESORPTION,
Sterling Drug, Inc., New York. (Assignee).
D. S. Ross.
U.S. Patent No. 5,094,544, 20 p, 15 fig, 18 ref; Official Gazette of the United States Patent Office, Vol 971, No 1, p 274-275, June 6, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Water quality control, Nitrogen compounds, Ammonia, Gases, Hydrogen ion concentration, Equipment, Vacuum desorption.

The requirements for treating wastewater have steadily increased. One of the requirements which is becoming more important is the elimination of nitrogen from wastewater effluent after the effluent has been processed for removing other polluting constituents. This invention is adapted to operate in many difficult types of processes containing objectionable quantities of ammonia-

nitrogen. Ammonia-nitrogen is present in wastewater as both ammonium ions and ammonia gas. The apparatus and method includes the concept of increasing the pH of the wastewater to a highly basic condition, exposing the wastewater to a vacuum having an absolute pressure at least approaching the vapor pressure of the wastewater proportional to the given temperature whereby ammonia gas is then desorbed from the wastewater, and subsequently absorbing the desorbed ammonia in a body of liquid having a pH substantially less than the highly basic condition of the original wastewater. (Sinha-OEIS)
W79-00841

AERATOR SEWAGE TANK,
H. L. Wilson.
U.S. Patent No. 4,093,549, 7 p, 9 fig, 17 ref; Official Gazette of the United States Patent Office, Vol 971, No 1, p 276-277, June 6, 1978.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Domestic wastes, Aeration, Aerobic conditions, Equipment.

A sewage treatment tank comprises an aeration compartment and a clarifying compartment separated by a vertical baffle-like wall having a steeply inclined lower portion which provides a hopper-like bottom in the clarifier compartment. A submerged pump is provided in the aeration compartment having an outlet discharging into the aeration compartment with specially devised aspirating means for drawing air through the outlet to mix with the raw sewage. It provides a high velocity air fluid stream for aerobic treatment. A separate curved baffle at the bottom of the vertical baffle imparts a circular roll-like stream to the aerating stream and by close spacing to the tank bottom provides a narrow throat-like passage to the clarifier compartment which facilitates drawing any heavy solids back to the aerating compartment for further treatment. A specially devised skimmer to skim solids from the clarifier compartment is provided at the discharge side of the pump. (Sinha-OEIS)
W79-00842

DEVICE FOR PURIFYING SEWER WATER IN SMALL SEWER SYSTEMS,
IFO A. B., Bromolla (Sweden). (Assignee).
U. Paabo, and E. H. Albertsen.
U.S. Patent No. 4,093,551, 4 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 971, No 1, p 277, June 6, 1978.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Domestic wastes, Water pollution treatment, Chemicals, Sedimentation, Equipment, Siphons.

A device purifies sewer water in a small sewer water system by chemical cleaning of the water which takes place by means of the addition of a liquid containing chemical substances which promote the sedimentation of contaminates in the water. The supply of such a liquid takes place from a receptacle via a tube operating according to the siphon principle. The object of this invention is to provide a purifying device which does not comprise any movable parts but nevertheless automatically controls the supply of the chemical treatment liquid in response to the supply of sewer water. (Sinha-OEIS)
W79-00843

WATER PURIFICATION METHOD,
Westinghouse Electric Corp., Gateway Center, PA. (Assignee).
K. Moeglich.
U.S. Patent No. 4,094,755, 13 p, 14 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 971, No 2, p 683, June 13, 1978.

Descriptors: *Patents, *Waste water treatment, *Water purification, Industrial wastes, Domestic wastes, Suspended solids, Electrolysis, Electrodes, Electric fields, Electric currents, Turbulence, Equipment.

A variety of waste waters are treated by an improved method and apparatus for continuously agglomerating solids of colloidal size or larger suspended in a liquid. The process comprises passing the liquid between spaced electrode plates in the presence of a fluidized bed of conductive particles, and subjecting the liquid suspension to an electric field from alternating current applied across the electrodes through the conductive particles of the bed. The turbulence of the particles has been found to improve conductivity and current efficiency, minimize electrode erosion, and by a mechanical, scrubbing action of the bed particles, minimize fouling or scaling of the electrodes so that the suspending forces of the solids are rapidly and efficiently broken. THe agglomerated solids may then be separated from the liquid by conventional means such as skimming, settling, flotation and the like. (Sinha-OEIS)
W79-00847

METHOD FOR TREATMENT OF OIL-CONTAINING WASTE WATER BY USING AN OIL ADSORBENT,
Koa Oil Co. Ltd., Tokyo (Japan). (Assignee).
K. Noguchi, K. Yoshimura, H. Tanaka, and M. Hayashi.
U.S. Patent No. 4,094,776, 9 p, 1 fig, 7 tab, 3 ref; Official Gazette of the United States Patent Office, Vol. 971, No. 2, p 689, June 13, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Oil pollution, Industrial wastes, *Separation techniques, *Adsorption.

An oil adsorbent excellent in the capacity of adsorbing and collecting oils contained in waste waters and capable of being regenerated with ease to restore its activity after it has been used is described. A process for the preparation of the oil adsorbent and a method for treating oil-containing waste waters is also described. A pitch-like substance formed by heat treatment of a heavy hydrocarbon oil, especially one having a volatile matter content of about 10% by weight to about 60% by weight, has a very high oil-adsorbing capacity and after it has been used, the high adsorbing capacity can easily be restored by a simple regenerating method. This pitch-like substance shows an effective oil-adsorbing action when used in the powdery or granular form. (Sinha-OEIS)
W79-00850

PROCESS FOR THE LIQUID PHASE OXIDATION OF ORGANIC SUBSTANCE-CONTAINING EFFLUENTS,
Mitsui Toatsu Chemicals Inc., Tokyo (Japan). (Assignee).
Y. Iwai, M. Okabe, N. Seki, A. Hiai, and S. Iguchi.
U.S. Patent No. 4,094,780, 11 p 3 fig, 4 tab, 10 ref; Official Gazette of the United States Patent Office, Vol. 971, No. 2, p 690-691, June 13, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Organic wastes, *Water purification, Oxidation, Catalysts, Chemical reactions, Separation techniques, Liquid phase oxidation, Copper catalist, Recovery.

A process for the liquid phase oxidation of an organic substance-containing effluent comprises subjecting the effluent to a liquid phase oxidation treatment in the presence of a copper catalyst at a coppper ion concentration of 50-5000 ppm and also in the presence of an ammonium ion concentration of five or more times the copper ion concentration to oxidize the organic substances in the effluent. The copper catalyst is recovered from the treated effluent for reuse. The recovery of the copper catalyst may be effected either by a process in which the copper catalyst is separated as a precipitate or by a process using a resin adsorption. (Sinha-OEIS)

INTERFERENCES IN TRACE CONTAMINANT REMOVAL BY ADSORPTION FROM WATER FOR GROUNDWATER RECHARGE,
California Univ., Davis. Dept. of Civil Engineering.
K. McBride.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 386, Price codes: A05 in paper copy, A01 in microfiche. Master of Science Thesis, December 1977. 71 p, 16 fig, 7 tab, 22 ref, 2 append. (California Water Resources Center Project UCAL-WRC-W-510).

Descriptors: *Waste water treatment, *Groundwater recharge, *Phenols, Adsorption, Trace elements, Organic wastes, *Activated carbon, Effluents.

The central problem of this study is whether the advanced treatment of a waste stream containing phenolic compounds is feasible for the purpose of recharging to the groundwater. Removal of trace refractory organics requires use of a physicochemical method. Activated carbon adsorption is a suitable process choice because low level removals of most organic materials can be obtained, the process is inexpensive in comparison to other advanced treatment processes such as reverse osmosis and because considerable field experience has been gained. The project involves the adsorption of a domestic secondary effluent with a known addition of phenol onto activated carbon. Phenol was chosen as a specific contaminant because of its common abundance and it's very low level discharge requirements. Phenolic compounds may be found in the wastewaters derived from almost any oil, petro-chemical or pesticide related activity. These include oil refineries, wood and coal distillations and the manufacture of plastic and chemical products. (Synder-Calif, Davis)

A METHOD OF USING IRRIGATION DRAINAGE WATER FOR POWER PLANT COOLING,
California Univ., Berkeley. Sea Water Conversion Lab.
H. H. Sephton, and G. Klein.
Executive Summary Report, Section A: Process and Pilot Plant Design; Section B: Reduction of Scaling Potential in High-Calcium, High Sulfate Waters. Sept. 1977. (California Water Resources Center Desalination Project) 40 p.

Descriptors: *Irrigation water, *Water reuse, *Salinity, Wastewater, Ion exchange, Powerplants, Engineering structures, Cooling water, *Water softening, Feed water, Ion-exchange resins, Vertical tube foam evaporation.

The accumulation of large quantities of saline water collected from irrigated fields by underground drainage systems presents environmental problems in the South-Western U.S. and Mexico. Research and development projects suggested the technical and economic feasibility for using such wastewaters for power plant cooling, using a novel process sequence comprising (1) ion-exchange resin softening whereby nearly all the hardness is removed, followed by (2) using this softened water as feed to the power plant cooling tower, concentrating it by a factor of 5 to 15; this

cooling tower blowdown is subsequently (3) further concentrated by vertical tube foam evaporation (VTFE) to provide a 20-fold concentrate of the initially softened wastewater which is then adequate to (4) serve as the sole regenerant for the ion-exchange resin used in the initial softening step. Step (4) is carried out in an upflow fluidized bed mode which ensures favorable reaction kinetics by the formation and removal of calcium sulphate precipitate from the resin bed. EFFECTS OF BROMINE CHLORIDE ON SEVERAL UNICELLULAR GREEN ALGAL SPECIES UNDER LABORATORY CONDITIONS,
Illinois Univ. at Urbana-Champaign. Water Resources Center.
R. W. Randle.
Project Completion Report, April 1978, 40 p, 5 fig, 8 tab, 14 ref, 1 append. OWRT A-072-ILL(1).

Descriptors: *Waste water treatment, *Disinfection, *Chlorination, *Bromine, *Bromine chloride(BrCl), *Chlorophyta, *Algicides, Algal control, Water purification, Sewage treatment, Algae bioassay, Analytical techniques, Water quality control, Water pollution treatment.

The algicidal and algistatic effects of bromine chloride (BrCl) on various species of unicellular green algae were investigated under laboratory conditions using algal bioassay techniques. Concentrations of BrCl was applied as concentration levels likely to be found in field conditions where waste water disinfection is practiced: 0 mg/l (control), 0.20 mg/l, 0.50 mg/l, and 1.0 mg/l. Under the experimental conditions employed and for the species tested, BrCl appears to be an efficient algicidal agent in concentrations of 0.2 to 1.0 mg/l. In this concentration range, as halogen concentration increases, the number of viable algal cells decreases. Recommendations for further study include: (1) definition of the action time needed at particular concentrations; (2) concentration spikes or continuous chemical addition to maintain constant concentration; (3) lower chemical concentrations; (4) variations in response to other temperatures, such as 5 C, 20 C, and 35 C; (5) use of different test species, including Selenastrum capricornutum and Cossmarium spp. (thought to be chlorine resistant and bromine sensitive); (6) photoreactivity tests in light and dark growth conditions; (7) effects of combined residual halogen found in natural waterways; and (8) definition of metabolic modes of action of halogens on various algal species. REMOVAL OF WOOD-DERIVED TOXICS FROM PULPING AND BLEACHING WASTES,
Institute of Paper Chemistry, Appleton, Wisconsin.
D. B. Easty, L. G. Borchardt, and B. A. Wabers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 785, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Agency, Environmental Protection Technology Series EPA-600/2-78-031, 89 p, February, 1978. 19 fig, 14 ref, 23 tab. R-803525-04.

Descriptors: *Pulp wastes, *Waste water treatment, *Toxins, *Bleaching wastes, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution sources, Sulfite liquors, Pulp and paper industry, Aerated lagoons, Biological treatment, Biochemical oxygen demand, Activated sludge, Chemical precipitation, Lime, Reverse osmosis, Membrane processes, Membranes, Toxicity, Tertiary treatment, Aluminum, Sulfates, Fatty acids, Resin acids, Ultrafiltration, Guaiacols, Stearic acid, Kraft mills, Sulfite pulp mills.

Wood-derived compounds known to possess toxicity toward fish and to be present in pulp mill effluents include resin and unsaturated fatty acids, their chlorinated analogs, chlorinated guaiacols, and epoxystearic acid. Studies at the Institute of Paper Chemistry (Appleton, Wisconsin) were carried out to assess the extent to which these compounds are removed from pulp mill effluents by different waste treatment systems in use in several locations in the U.S.A. Effluents before and after treatment were analyzed. Nearly all of the waste treatment processes studied removed the toxic compounds effectively. Although primary clarification had little effect on these materials, aerated lagoons and air-activated sludge systems normally removed from 80 to 100% of the resin and fatty acids and their chlorinated analogs from kraft and sulfite mill effluents. Biological treatment facilities which exhibited poorer fatty and resin acid removal were those which received high loadings of fatty and resin acids and BOD. High loadings were apparently reflected also in the lower percentage removal of the toxic compounds in the two oxygen-activated sludge systems studied. Large reductions in concentrations of the toxicants were observed following precipitation processes (lime precipitation and tertiary treatments employing alum). Reverse osmosis demonstrated essentially complete rejection of fatty and resin acids. Performance of pilot ultrafiltration units was either good or marginal, apparently depending upon the type of membrane used. Although chloroform contents of the samples were affected minimally by ultrafiltration, they underwent reductions of from 88 to 98% in all of the other treatment systems studied. (Witt-IPC)

5E. Ultimate Disposal Of Wastes

TECHNICAL AND REGULATORY STATUS OF THE PLACEMENT OF SANITARY LANDFILLS IN IOWA,
Iowa State Univ., Ames.
L. V. A. Sendlein, and J. Kipp.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 337, Price codes: A05 in paper copy, A01 in microfiche. Iowa State Water Resources Research Institute Completion Report ISWRRI-87, September 1977. 87 p, 17 fig, 19 tab, 19 ref. OWRT A-065-IA(1).

Descriptors: *Landfills, *Iowa, *Groundwater, *Surveys, *Data collections, *Hydrologic data, *Monitoring, Drainage, Sinks, Flood plains, Leachates, Topography, River basins, Geology, Water resources, Groundwater geology, Hydrogeology, Water pollution, Water pollution sources, Soil contamination, Disposal, Evaluations.

Landfill placement in Iowa was summarized and the effects of landfill placement for three upland Iowa sites were monitored and discussed. Information on landfills was obtained by inspecting all permits and was used to tabulate and analyze landfill sites in Iowa relative to topographic position, monitoring programs, geographic distribution, geologic position, river basins, and hazard zones. Major conclusions were: (1) current regulations favor upland placement of landfills; (2) pollution enclaves formed from floodplain sites are predictable if this location is to be used, the number in any one drainage basin must be considered to protect river water quality; (3) pollution enclaves formed from upland sites are less predictable because of deeper penetration and larger number of geologic units encountered from source to sink; (4) of all sites, 53.1% are in uplands, 41.5% are on valley walls or ravines, and only 5.4% occur on flood plains; (5) approximately 35% of permitted landfills have required monitoring; and (6) there is high correlation between the area of each hazard zone and the present landfills found in each. Data gathered from the three upland sites are somewhat limited but several conclusions were reported: leachate concentrations are lower than those found in previous studies in Iowa floodplain sites; because more activities of man can be met between landfill and groundwater sink, the pollution enclave is more complex in shape and direction of flow; and production of leachate depends more on precipitation than in floodplain sites. INVESTIGATION OF SUBAQUEOUS BORROW PITS AS POTENTIAL SITES FOR DREDGED MATERIAL DISPOSAL,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
J. D. Broughton.
Available from the National Technical Information Service, Springfield, VA 22161, Price codes: A09 in paper copy, A01 in microfiche. Technical Report D-77-5, May 1977. 190 p, 34 fig, 118 tab, 62 ref.

Descriptors: *Borrow pits, *Submarine canyons, *Dredged material disposal, *Subaqueous disposal areas.

Surveys knowledge of inventories, describes and evaluates the potential for using subaqueous pits, holes, or depressions as dredged material disposal sites. Scope was limited to an investigation of the estuaries, bays, rivers, and continental shelf areas of coasts of the United States, including the Great Lakes. All subaqueous depressions whether caused by dredging, extraction activities, or natural erosional events, were included. Surveys revealed little research has been accomplished on the effects of pits, holes, or depressions on the aquatic environment. However, the degradation of bays, estuaries, and shelf areas, the importance of these locales to the survival and growth of numerous aquatic species, and increasing public awareness in these areas, will probably result in increased research. A subaqueous site inventory resulted in the location of 125 former, existing, or potential subaqueous pits, holes, or natural depressions. Data collected for each of these sites were recorded and compiled along with site location maps. Site data were examined with reference to pertinent literature to obtain qualitative descriptions of the sites. Description of trenches and canyons, beach replenishment or construction aggregate sites, and shell dredging sites were derived in terms of extreme values and average conditions. (WES)

COLONIAL NESTING SEA AND WADING BIRD USE OF ESTUARINE ISLANDS IN THE PACIFIC NORTHWEST,
Graham (John) Co., Seattle, WA.
C. F. Peters, K. O. Richter, D. A. Manuwal, and S. G. Herman.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-17, May 1978. 220 p, 46 tab, 40 fig, 36 ref, 4 append.

Descriptors: *Birds, *Estuarine environment, Islands, *Pacific Northwest U.S., Habitats, *Shore birds, *Wading birds, Dredged material, *Dredged material disposal, *Waste disposal sites, Colonial birds.

Twenty-three natural and dredged material islands were examined in seven locations from Anacortes, Washington, to Coos Bay, Oregon, to establish the relationships between plant communities and use by colonial nesting waterbirds for both types of islands, as well as the actual bird use of dredged material islands in the Pacific Northwest. Nine islands were found to be used for nesting by one or a combination of glaucous-winged gulls, western-glaucous-winged (hybrid) gulls, ring-billed gulls, Caspian terns, and common terns. Colonies of great blue herons were found on two islands 61 and 97 km from the mouth of the Columbia River. Habitat maps were prepared for each island studied and detailed floristic descriptions of each bird colony evaluated. Colony location, breeding phenology, and nesting success were analyzed with respect to existing flora, environmental stress, island physiography, and human disturbance. Results showed that although dredged material deposition influenced an island's physical dimensions, topography, and substrate, plant communities were physiognomically similar to natural islands. Seabird colonization occurred irrespective of dredging history. Nesting populations appeared to be greater in areas of low human disturbances. Colonization and productivity were primarily related to protection from environmental stress. (WES)

AQUATIC DISPOSAL FIELD INVESTIGATIONS, GALVESTON, TEXAS, OFFSHORE DISPOSAL SITE; EVALUATIVE SUMMARY,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
T. D. Wright, D. B. Mathis, and J. M. Brannon.
Technical Report D-77-20, May 1978. 89 p, 13 tab, 5 fig, 19 ref, 3 append.

Descriptors: *Environmental effects, *Aquatic environment, Pollutants, Water quality, *Sediments, On-site investigations, Dredged material, *Dredged material disposal, *Waste disposal sites, *Galveston Bay(Tex), Texas, *Offshore disposal, Ocean waste disposal.

Investigated in 1975 and 1976, the physical (sedimentological), chemical, and biological impacts of dredged material disposal at an authorized disposal site offshore Galveston, Tex. A hopper dredge was used for dredging and disposal, and most of the dredged material consisted of clean sand and sandy silt from the Galveston Bay Channel. A small amount of contaminated material from the Texas City Turning Basin was also placed in the disposal site. Results indicate the authorized disposal site was appropriate for the disposal of material from the dredged areas. Sediment movement after disposal was away from the dredged areas; disposition would not occur in navigation channels. As expected, material deposited in the shallow parts of the disposal site had a rather rapid rate of erosion and dispersal, while that placed in the deeper areas tended to remain in place throughout the study period. The chemical impact of disposal on water quality and sedimentological parameters was minimal. Although some changes were observed, these had little, if any, significance. Biological impacts also appeared to be of marginal significance. Changes in the abundance and types of organisms in disposal areas could not be distinguished from changes in reference areas. (WES)
W79-00751

AQUATIC DISPOSAL FIELD INVESTIGATIONS, EATONS NECK DISPOSAL SITE, LONG ISLAND SOUND; AN ENVIRONMENTAL INVENTORY,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
S. P. Cobb.
Technical Report D-77-6, May 1978. 119 p, 27 tab, 41 ref, 6 append.

Descriptors: *Environmental effects, *Sedimentation, *Aquatic environment, New York, Dredged material, *Dredged material disposal, *Waste disposal sites, *Eaton's Neck, Long Island Sound(NY).

Investigates the environmental effects of open water dredged material disposal at the Eatons Neck Disposal Site in central Long Island Sound, New York. Environmental conditions are described at the Eatons Neck Disposal Site as they were four years after cessation of disposal operations. Dredged material, building rubble, and other materials were dumped at the site for about 70 years (1900 to 1971); 9,841,000 m3 of dredged sediments were placed at the site from 1954 to 1971. Any effects of the presence of dredged material at the site on nutrients, metals, and other chemical variables in the central sound are minimal and are probably overshadowed by effects of sewage effluents and other river inputs. There were few significant differences in the abundance and composition of the benthic macrofauna between sampling stations located on the dredged material deposit and the reference stations. Results of hydrodynamic, bathymetry, and sediment studies showed no evidence of dispersion of dredged material from the site. Thus it appears that the Eatons Neck site is suitable, from a confinement standpoint, for the disposal of dredged sediments. (WES)
W79-00752

FIELD STUDY OF THE MECHANICS OF THE PLACEMENT OF DREDGED MATERIAL AT OPEN-WATER DISPOSAL SITES,
Yale Univ., New Haven, CT. Dept. of Geology and Geophysics.
H. J. Bokuniewicz.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-7, April 1978. 2 vols. (Vol 1: Main text and App A-I; 318 p, 8 tab, 29 fig, 18 ref); Vol 2: App J-O).

Descriptors: *Dredged material, *Dredged material disposal, *Waste disposal sites, *Ocean waste disposal.

A field study of the mechanics of the placement of dredged material at five locations: an estuarine site on the Atlantic, one on the Pacific coast, two sites in the Great Lakes, and one in the open ocean. The objective was to observe all the processes by which dredged material is emplaced on the bottom at a disposal site. Instrument arrays were designed to define the transit of dredged material in time and space from the moment of its release until its final deposition. Methods used included optical transmittance, acoustic pulse echo and water flow measurements with instrument arrays, and water sampling by continuous pumping. Additional observations were made to characterize the mechanical properties of the dredged material, its quantity, and the rate at which it is released into the receiving water. Observations demonstrate the dependence of the placement processes on water depth, the currents at the disposal site, and the properties of the dredged material. Accurate, controlled placement is possible under a wide range of disposal site conditions. Control of the placement can be attained through selection of dredging method, design of the containing vessel, and choice of disposal site characteristics. (WES)

INVESTIGATION OF CONTAINMENT AREA DESIGN TO MAXIMIZE HYDRAULIC EFFICIENCY.
Gallagher (Brian J.) and Co., Los Angeles, CA.

Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-12, May 1978. 194 p, 7 tab, 81 fig, 78 ref, 5 append.

Descriptors: *Flod characteristics, *Sedimentation, Mathematical models, Computer programs, *Containment areas, *Dredged material disposal, *Waste disposal sites, *Hydraulic efficiency.

Investigates methodologies for improving the hydraulic efficiencies of dredged material containment areas and develops general guidelines for the proper design and operation of containment areas and their inlet and outlet arrangement. Consists of (a) a review of published literature and technical reports, (b) site visits and field tests at ten active disposal areas to obtain recent operational data, (c) development of a mathematical models and computer programs to predict flow patterns and retention times of different containment area configurations, and (d) formulation of a general methodology for the design of efficient containment areas. Adding spur dikes to increase the effective length-to-width ratio, prevent short-circuiting between inlet and outlet, and retard wind-induced circulation was the most economical method of maximizing hydraulic efficiency, particularly for large, square-shaped areas. Other recommendations include the specification of minimum ponding depths based on selective withdrawal principles and the design of long, rectangular weirs to prevent flow concentration and resuspension problems. AQUATIC DISPOSAL FIELD INVESTIGATIONS, DUWAMISH WATERWAY DISPOSAL SITE, PUGET SOUND, WASHINGTON; APPENDIX A: EFFECTS OF DREDGED MATERIAL DISPOSAL ON DEMERSAL FISH AND SHELLFISH IN ELLIOT BAY, SEATTLE, WASHINGTON,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
J. R. Hughes, W. E. Ames, and G. F. Slusser.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-77-24, May 1978. 105 p, 20 tab, 11 fig, 25 ref, append.

Descriptors: *Environmental effects, *Washington, *Demersal fish, *Shellfish, Dredged material, *Dredged material disposal, *Waste disposal sites, *Duwamish Waterway, Elliott Bay.

This report determines the effects of dredged material disposal on demersal fish and shellfish at the disposal site. A standard Marinovich 'try net' sampled the disposal site and two reference sites. Catches of both fish and shellfish were inconsistent at the three sites with respect to both numbers and species, indicating a seasonal fluctuation in both abundance and composition. Statistical analyses showed that differences in abundance and composition were significant among the different sampling sites and the different sampling periods. However, experimental design and inherent differences among the sampling sites made it difficult to determine whether the catch differences were attributable to effects of the dredged material disposal or population fluctuations due to migratory behavior patterns. It was concluded that the quantity of dredged material dumped during the study did not have a lasting detrimental effect on the demersal fish and shellfish populations at the disposal site. Recommend future studies include a longer time for collecting baseline data, characteristics of the reference sites be more comparable to the disposal site, and disposal operations be conducted in a manner similar to that which is used in actual practice so the results might have general application. HABITAT DEVELOPMENT FIELD INVESTIGATIONS, MILLER SANDS MARSH AND UPLAND HABITAT DEVELOPMENT SITE, COLUMBIA RIVER, OREGON; APPENDIX F: POST-PROPAGATION ASSESSMENT OF WILDLIFE RESOURCES ON DREDGED MATERIAL,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
J. A. Crawford, and D. K. Edwards.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-77-38, May 1978. 191 p, 13 tab, 2 fig, 66 ref, 4 append.

Descriptors: *Marshes, *Columbia River, *Habitats, *Wildlife, *Wildlife habitats, Plant populations, On-site investigations, *Dredged material, *Waste disposal sites.

Wildlife response to plant propagation on a dredged material island in the lower Columbia River was assessed from July 1976 through August 1977. Plantings were done in late summer and fall of 1976. Data on birds, mammals, and terrestrial macroinvertebrates were collected, analyzed, and compared with data from other regions of the United States. Natural beach, marsh, upland, tree-shrub, planted marsh, and planted upland habitats were examined. The planted marsh was used by fewer bird species than a reference marsh; however, a trend near the end of the study indicated that use of both will eventually be similar. Upland platings apparently increased the number and diversity of species which used adjacent upland areas. Waterfowl fed and nested in the upland plantings, preferring a barley/bentgrass/red clover mix for feeding and a reed canary grass/red fescue/hairy vetch mix for nesting. Few small mammals were traped, but it appeared that the Townsend'S vole population increased in the uplad canary grass/fescue/vetch mix. Macro-invertebrate populations increased on the upland. Platings did not have dramatic effects on the populations. Avian density ad diversity were mostly unaffected. But in some instances, the number and type of species change. (WES)

AQUATIC DISPOSAL FIELD INVESTIGATIONS, COLUMBIA RIVER DISPOSAL SITE, OREGON; EVALUATIVE SUMMARY,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
C. G. Boone, M. A. Granat, and M. P. Farrell.
Technical Report D-77-30, May 1978. 100 p, 27 ref, 20 fig, 8 tab, 5 append.

Descriptors: *Aquatic environment, *Columbia River, *Bottom sediments, Sedimentation, Dredged material, *Dredged material disposal, *Waste disposal sites.

Physical data indicate that dredged material deposited in the nearshore zone off the mouth of the Columbia River maintains its identity relative to sorrounding sediments for periods of years and migrates north at a rate of approximately 0. 6 kilometre per year. Chemical data suggest that the release of dredged material at the disposal area has no measurable effect on either ambient water quality or quality of the sediments. Dredged material removed from the Columbia River entrance channel can be characterized as fine to medium sand with insigficant levels of pollutants. Bottom sediments examined from the tidal delta in the region of disposal site B consistently showed higher levels of nutrients and metals than sediments from adjacent sampling sites. Biological studies indicate that the disposal of dredged material had a measurble effect on both the benthic macroinvertebrates and the demersal finfish at the experimental disposal area. Benthic macroinvertebrate stations exposed to direct burial by dredged material had significantly higher diversity values and lower density values than unaffected stadtions. Demersal fish studies indicate that species diversity, species richness, and catch per uit effort indices were depressed following disposal. (WES)

TREATMENT CONTROL APPARATUS FOR WATER SYSTEMS,
J. R. Bury.
U.S. Patent No. 4,094,786, 7 p, 7 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 971, No 2, p 693, June 13, 1978.

Descriptors: *Patents, *Water treatment, *Water quality control, *Control systems, Mechanical control, Timing, Instrumentation, Automatic control, Chemical treatment, Liquid feeders.

A control apparatus for liquid water treatment systems has a float sensitive switch; and means for connecting the small tank to the water reservoir so that the water in the small tank drops responsive to a drop in water level in the reservoir. Activation of the float switch causes voltage to flow both to a solenoid operated water valve and an electric motor actuated totalizer having a digital read out. Cam devices are adapted to determine a predetermined time period during which the switch is held closed. The invention permits the direct injection with a high degree of accuracy of those chemical solutions adapted to be added to a water reservoir in relatively high concentration is such manner that the treatment solution injection is proportional only to the total make up of water delivered to the reservoir. (Sinha-OEIS)

SULFUR GAS REMOVING AND SOLID PARTICLE FILTER FOR WELL WATER,
R. J. Kemper.
U.S. Patent No. 4,094,789, 6 p, 5 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 971, No 2, p 694, June 13, 1978.

Descriptors: *Patents, *Water wells, *Water sources, Deep wells, Water purification, *Water treatment, Water quality control, Filters, Sulfur, Gases, Aeration.

A need exists for an apparatus which will be capable of removing sulfur gas from the water pumped at a deep water well and which will also be capable of filtering other impurities out of the water. The filter of this invention includes a structure where jets of water pumped from a deep well are thoroughly commingled with jets of air under pressure. The jets of water and air are impacted against a splash plate to effect further commingling of the air and water. The air is thereafter vented from the water after which the water passes through a filter body for removing solids and other impurities. Substantially all of the gas, a major portion of which may comprise sulfur gas, is driven from the water and whatever small quantity of sulfur gas remains in the water is highly diluted by the air under pressure commingled with the water. (Sinha-OEIS)
W79-00821

SOFTENING UNIT FOR APPLIANCE,
Sta-Rite Industries, Inc., Racine, WI. (Assignee).
E. C. Grout.
U.S. Patent No. 4,090,963, 5 p, 2 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 970, No 4, p 1424, May 23, 1978.

Descriptors: *Patents, *Water softening, *Water treatment, *Water quality control, Ion exchange, Resins, Domestic water, Regeneration.

A water softening unit positioned between the mixing valve and washing basket of a washing machine includes a housing having a water inlet and outlet and an inlet for the introduction of salt into the housing. A partition divides the housing into a regeneration chamber and an ion-exchange chamber communicating with one another at one end of the partition. A pressure relief valve is located in the partition. A flow restriction valve located between the housing inlet and the regeneration chamber restricts flow through the softening unit when actuated, thereby allowing complete and thorough regeneration. The valve is normally open and when operated manually or otherwise to its alternate or actuated position, it remains in its actuated condition until the regeneration operation is completed. (Sinha-OEIS)
W79-00823

ACID DISPENSER FOR WATER SOFTENER UNIT,
Ecodyne Corp., Lincolnshire, IL. (Assignee).
D. A. Bakken, R. A. Henderson, and E. J. Tischler.
U.S. Patent No. 4,090,964, 5 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 970, No 4, p 1424, May 23, 1978.

Descriptors: *Patents, *Water softening, *Water treatment, Ion exchange, Resins, Iron, Acids, Equipment, Regeneration.

Water softener units utilizing ion exchange resin particles must be regenerated periodically with a brine solution to restore the water hardness removing ability of such particle. When iron is present in the water being treated it is advantageous to include weak acids, such as citric acid, in the regeneration solution. A supply of such acid is stored in a separate container and a metered dose is dispensed into the brine tank during each regeneration cycle of the water softener. The dispenser utilizes a generally hat-shaped diaphragm that flops from one surface of a metering chamber to the opposite surface when acted upon by either pressure or suction. The diaphragm essentially lines one-half of the chamber at a time, and its movement either draws acid into the chamber or expels the acid from the chamber. (Sinha-OEIS)

SEQUESTERING OF CA++ AND MG++ IN AQUEOUS MEDIA USING ZEOLITE MIXTURES,
Union Carbide Corp., New York. (Assignee).
A. F. Denny, A. J. Gioffre, and J. D. Sherman.
U.S. Patent No. 4,094,778, 4 p, 1 fig, 5 ref; Official Gazette of the United States Patent Office, Vol. 971, No. 2, p 690, June 13, 1978.

Descriptors: *Patents, *Water treatment, *Water softening, *Ion exchange, Zeolites, Hardness(Water), Calcium, Magnesium, *Water treatment, Synergistic effects.

The invention relates in general to the removal or sequestration of calcium and magnesium cations from aqueous solutions, and more particularly to the softening of hard water by ion exchange using mixtures of zeolite A and zeolite X. Mixtures of zeolite A and zeolite X containing about 40 to 70 weight per cent of each species are found to exhibit a synergistic effect in the sequestering by ion exchange of calcium and magnesium ions in hard water. These zeolite mixtures can be advantageously used in detergent compositions as substitutes in part or in full for polyphosphate builders. (Sinha-OEIS)
W79-00851

WATER PURIFICATION MEANS AND METHOD,
A. S. Behrman.
U.S. Patent No. 4,094,779, 6 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol. 971, No. 2, p 690, June 13, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, *Water quality, Domestic water, Filtration, Odor, Taste.

A filtration system for purifying a relatively small volume of water and for removing objectionable tastes and odors from drinking water is described. An inverted container of the water to be purified is supported above a filter which in turn is supported above a bottom container for receiving the effluent from the filter. The upper container is provided with an outlet tube which extends into the filter and is provided with means for regulating the flow of water to the filter. The filter holds a disposable filter medium in the form of a thin 'sandwich' of two outer sheets of readily permeable material and a thin inner layer of activated carbon particles between the two outer sheets. In operation, water flows from the upper container through the filter into the bottom container, the rate of flow of water from the upper container being controlled automatically by the lvel of water in the filter. TESTS OF COAGULANTS FOR THE REDUCTION OF VIRUSES, TURBIDITY, AND CHEMICAL OXYGEN DEMAND,
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
S. P. Shelton, and W. A. Drewry.
Journal American Water Works Association - Vol. 65, No. 10, p 627-635. October 1973, 9 fig, 5 tab, 24 ref. OWRT A-018-TENN(5).

Descriptors: *Coagulation, *Viruses, Turbidity, Biochemical oxygen demand, Turbidity, Chemical oxygen demand, *Water treatment, Bacteriophage.

This study attempts to ascertain (1) how effective different chemical coagulants and polyelectrolytes are in virus removal; and (2) how results, using the same primary coagulants, correlate for a relatively unpolluted raw surface water, a moderately polluted surface water, and a secondary wastewater-treatment-plant effluent with respect to virus removal. Aluminum sulfate, ferric chloride, and ferric sulfate are the most promising of the group of primary coagulants tested from the standpoint of f2 bacteriophage remova. These coagulants are effective in the removal of COD, color, suspended solids, and turbidity. Aluminum sulfate is the most effective coagulant, whereas ferric chloride and ferric sulfate are comparable and less effective. The cationic polyelectrolyte tested is not satisfactory as a primary coagulant because of its poor floc formation and settling characteristics as well as its inability to facilitate removal of turbidity and COD. Virus removals with the cationic flocculant were only moderate, Anionic, nonionic, and cationic polyelectrolytes have only minor significance in virus removal. The use of sodium aluminate with aluminum sulfate does cause a marked increase in virus removal. There seems to be promise that a simple mathematical relationship exists between raw-water COD and the optimum dosage of primary coagulants for virus and turbidity removal. The f2 bacteriophage is an excellent virus with which to work and appears very similar to many animal viruses of concern. (Larson-Tenn)
W79-00868

VIRUS REMOVAL BY CHEMICAL COAGULATION,
D. W. York, and W. A. Drewry.
Journal American Water Work Association, Vol 66, No. 12, p 711-716, December 1974. 3 fig, 2 tab, 33 ref. OWRT A-018-TENN(6).

Descriptors: *Coagulation, *Viruses, *Flocculation, Public health, Bacteriophage, Chemical precipitation, *Water treatment.

Water treatment plants must employ a process which will remove and/or inactivate viruses to a high degree in order to protect public health. Conventional water treatment methods including chlorination have not been completely acceptable in regards to virus removal. A comparison was made of the efficiency of virus removal of a wide range of coagulants and coagulant aids. The f2 bacteriophage was used in all experimental work. Standard procedures were used for both flocculation tests (jar tests) and virus enumeration. The test water was obtained from the surface of Fort Loudoun Lake in Knoxville, Tennessee. Aluminum sulfate and ferric chloride were most effective in removing the virus from the test water. Both aluminum sulfate and ferric chloride were capable of removing over 99 percent of the f2 bac-

teriophage. Cationic polyelectrolytes were unsatisfactory as primary coagulants due to their inability to remove turbidity, color, and COD. Cationic, nonionic, and anionic polyelectrolytes as coagulant aids with aluminum sulfate did not significantly increase the performance of the coaulation system above that obtained with aluminum sulfate alone. The addition of a small dose of sodium aluminate with aluminum sulfate did not increase the removal of the f2 bacteriophage but did serve to increase the reduction of COD while building a dense, rapid-settling floc. The colloidal-titration technique appears to give a reasonable indication of the isoelectric point. (Larson-Tenn)

WASTEFREE TECHNOLOGY, (IN RUSSIAN),
A. V. Pavlov.
Gig Sanit 8, p 8-11, 1976.

Descriptors: Technology, *Industrial wastes, Sewage effluents, *Water pollution control, *Water quality standards, USSR.

Determination of the term wastefree technology, and principles of its classification are given. Plans to create sewage-free industries under inclusion of the reutilization of water supply are discussed. Such reverse water supply systems are already in operation in the Soviet Union in plants of the nonferrous metals, petro-chemical, textile, synthetic polyamide and polyester fiber production industries, and in petroleum refineries. Antipollution measures to protect air from industrial emissions, at present conducted by the iron and steel industry in the Ukrainian SSR (USSR), are outlined.--Copyright 1978, Biological Abstracts, Inc.

ACID LAKE RENOVATION,
Peabody Coal Co., Central City, KY. Regional Lab.
W. A. Rosso.
In: 7th Symposium on Coal Mine Drainage Research, October 18-20, 1977, Louisville, Kentucky, p 61-70. 5 fig, 4 tab, 9 ref.

Descriptors: *Lakes, *Lake restoration, *Acid mine water, *Water pollution treatment, *Limestones, *Acid lakes, Kentucky, Peabody Coal Company, River Queen Mine(KY), Invertebrates, Mine water, Mine drainage, Fish, Insects, Amphibians, Reptiles, Mollusks, Costs, Impoundments, Aquatic plants, Biological communities, Ecosystems.

Five acid lakes created in 1967 during surface coal mining at the Peabody Coal Company's River Queen Mine in Muhlenberg County, Kentucky were successfully restored through treatment with limestone. The treatment applied was 44.8 metric tons of agricultural limestone/ha on problem areas within each lake's watershed, and certain extremely toxic areas caused by extensive waste coal and gob were covered by grading. The limestone was blown over the lake surface using a truck with blower attachment, except at lake 5 where only the watershed was treated. The lakes, all extremely acidic prior to treatment (pH 3.0-4.3), attained the state water quality standard of pH 6.0 within six months, again with the exception of lake 5, which took 18 months. Renovation costs never exceeded estimated costs of draining and filling, and ranged from 10-100% of those costs. Before treatment all lakes were devoid of fish, and fauna consisted primarily of chironomid and ceratopogonid larvae and a few aquatic beetle species. The only aquatic vascular plants were the cattail Typhaslatifolia (all lakes) and narrow-leafed cattail T. angustifolia (lake 2 only). After treatment diverse communities of vertebrates and invertebrates appeared, mostly through natural invasion, but supplemented by fish stocking. Macroinvertebrate orders increased from four to nine; frogs, toads, turtles, and snakes appeared; and wetland birds and mammals appeared or increased. (Lynch-Wisconsin)

TO TELL THE TRUTH: IMPERFECT INFORMATION AND OPTIMAL POLLUTION CONTROL,
Massachusetts Inst. of Tech. Cambridge.
E. Kwerel.
The Review of Economic Studies, Vol 44, October 1977, p 595-601. 2 fig, 1 ref.

Descriptors: *Economics, *Optimization, *Pollution taxes(Charges), *Permits, *Information, *Pollution abatement, Licenses, Public policy, Regulation, Costs, Damages, Equations, Waste disposal, Incentives.

A new pollution control scheme incorporating both effluent charges and licensing is proposed which will induced firms to reveal the true costs of cleaning up pollution. To design an optimal pollution control plan it is necessary to know both the damages resulting from pollution and the costs of reducing pollution; this scheme fulfills the latter requirement. The paper first examines incentives of firms to deceive the regulatory authority when confronted with either a pure licensing or a pure effluent charge policy. The analysis, based on one pollutant, assumes that all waste discharged has same impact regardless of firm, and that governmet can assign a dollar value to expected damages. The mixed plan is shown to balance exactly the incentive to overstate control costs under licensing with the incentive to understate costs under effluent charges, so that firms are induced to make socialy-optimal reports to the government. The plan consists of: (1) issuance of a fixed stock of transferable licenses, and (2) payment to firms of a subsidy per license in excess of emissions. Given the market price of licenses, the firm seeks to minimize the sum of treatment costs plus license fees minus rebates. The result is that each firm's total costs are minimized when the goverment sets the socially optimal effluent subsidy and stock of licenses. (Lynch-Wisconsin)

ENVIRONMENTAL QUALITY AND GAINS FROM TRADE,
Mannheim Univ. (West Germany).
H. Siebert.
KYKLOS, Vol. 30, No. 4, 1977, p 657-673. 1 fig, 12 ref.

Descriptors: *Economic-environmetal tradeoffs, *Welfare(Economics), *International trade, *Economics, *Environmental economics, *Pollution abatement, *Public policy, Environmental effect, Industry, Mathematical models, Model studies, Pollution taxes(Charges), Air pollution, Equations.

A two-commodity model, with production of the first commodity considered pollution-intensive, is used to assess the extent to which gains from international trade are altered when effects on environmetal quality are considered. Two situations are analyzed: (1) The home country, which has a comparative price advantage in the first commodity, specializes in its production; emissions increase and environmental quality declines, with reduction in overall benefits to society from trade. (2) The home country enacts an appropriate environmental policy, such as emission taxes. Analysis shows that: (2) if a country exports its pollution-intensively produced commodity, its gains from trade are accompanied by a decline in its environmental quality; (2) if an environmental protection policy is enacted under these circumstances, environmental quality will be improved but gains from trade will be reduced; (3) with the introduction of environmental policy, resource use and output in the pollution intensive sector will decline; (4) quantities exported and imported will fall and pollution abatement will increase; (5) there will be an overall

welfare gain from environmental policy as long as marginal social costs of production are higher than the marginal value of the commodity in consumption, or the emission tax is lower than marginal environmental damage. In an open economy emission taxes must be set according to the same rules as in a closed economy (emission tax-marginal environmental damage prevented. (Lynch-Wisconsin)
W79-00589

THE CONTINUING PROBLEM OF NON-NATIVE FISHES IN FLORIDA,
P. L. Shafland.
Fisheries, Vol. 1, No. 6, November-December 1976, p 25. 4 ref.

Descriptors: *Florida, *Fish, *Exotic fish, *Fish control agents, *Biocontrol, Canals, Swamps, Marshes, Ditches, Hoplian malabaricus, Tilapia mariae, Tilapia zillii, Cichlasoma trimaculatum, Betta splendens, Water pollution effects, Environmental effects, Ecosystems.

The number of reproducing populations of non-native fishes in Florida continues to increase, with 25 species and five hybrids verified. Added to those listed by Courtenay, et. al (1974) are: Hoplian malabaricus, Tilapia mariae, T. zillii, Cichlasoma trimaculatum, and Betta splendens. The establishment rate is indicative of south Florida's environmental instability, due primarily to physical alteration of water flow patterns and other forms of aquatic pollution. Introduction of the fish is due to the irresponsibility of a few tropical fish farmers, in some cases; however, T. zillii has been purposely introduced as an aquatic weed biocontrol agent. The South American tigerfish (H. malabaricus), reportedly a voracious piscivore, is potentially the most harmful of these exotic species; the infested area connects with a swamp and open marsh draining into the Little Manatee River. The location of the Tilapia mariae infestation in the Dade County canal system largely precludes renovation. The T. zillii population was located in a small borrow pit south of Miami, which, upon renovation, yielded seven exotic species in addition to T. zillii: T. mariae, T. mossambica, Hypostomus plecostomus, Corydoras sp., Danio malabaricus, Capoeta tetrazona, and Carassium auratus. A remnant population of Cichlasoma trimaculatum probably exists in the Tampa area following an attempted renovation; the species was found to be euryhaline, and had access to saltwater. The population of Siamese fighting fish (Betta splendens) is confined to a small area of Dade County in ditches where renovation is impractical. (Lynch-Wisconsin)
W79-00591

TILAPIA--A MANAGEMENT TOOL FOR BIOLOGICAL CONTROL OF AQUATIC WEEDS AND INSECTS,
Caifornia Univ., Riverside. Div. of Biological Control.
W. J. Hauser, E. F. Legner, R. A. Medved, and S. Platt.
Fisheries, Vol. 1, No. 6, November-December 1976, p 24.

Descriptors: *Tilapia mossambica, *Tilapia zillii, *Biocontrol, *Aquatic weed control, *Insect control, *Fish, Chara, Potamogeton pectinatus, Najas guadalupensis, Myriophyllum spicatum, Mosquitoes, Midges, California, Algal control, Algae, Filamentous algae, Rice, Ponds, Irrigation canals, Ditches, Water temperature.

Two species of the fish Tilapia have been used successfully for biocontrol of several aquatic plant species and mosquitoes and midges. Tilapia have also been cultured as a protein source, and for sport and commercial fising. Tilapia zillii and T. mossambica have been used alone or in combination for aquatic weed and insect control; T. zillii appears more efficient that T. mossambica in control of higher aquatic weeds and chara. Two factors limit use of T. zillii as a weed control agent: (1) it cannot survive low winter water temperatures in irrigation canals and ditches in southern California, where extensive research is underway; and (2) it prefers sago pondweed (Potamogeton pectinatus), southern naiad (Najas guadalupensis), and Chara spp. over Eurasian water milfoil (Myriophyllum spicatum). Because of its temperature requirements, Tilapia is limited to southern states, and in California cultures must be maintained continuously using geothermal artesian water. In waterways where M. spicatum occurs with more preferred weeds, the former may reach nuisance proportions; an integrated control program incorporating both biological and mechanical techniques is being developed. Excellent weed control has resulted with the fish used alone at stocking rates of 1450-2500 fish/ha. In rice ponds a mixed culture of T. zillii and T. mossambica controlled chara, filamentous and mat-forming algae, N. guadalupensis, and P. pectinatus; control was superior to herbicides. IMPACT OF ENERGY DEVELOPMENT ON COLORADO RIVER WATER QUALITY,
Utah State Univ., Logan. Dept. of Civil and Environmental Engineering.
A. B. Bishop.
Natural Resources Journal, Vol. 17, No. 4, p 649-71, October, 1977. 6 fig, 5 tab.

Descriptors: *Desalination, *Mexico, *Colorado River basin, *Water quality control, Energy, Brines, Saline water, Water pollution sources, Legislation, Comprehensive planning, Protection.

Energy development in the Colorado River Basin has created a broad range of potential water quality problems. Point source pollution is controllable by current water quality laws, such as Public Law 92-500. Related activities, land surface disturbance, air emissions, mining operations, and water withdrawals could also affect water quality. These activities are not as easily controlled. Mexico and the United States consider salinity the chief water quality problem. The future development of compact-apportioned waters in the basin has been analyzed through water and slat mass balance model studies. Total dissolved solid concentrations are seen to increase below Imperial Dam. Thus, by taking water that serves for dilution out of the river, salinity concentrations are more highly affected. Salinity impact from energy development is reduced due to the control strategy of no salt return in the form of highly concentrated brines. The Colorado River Regional Assessment study has estimated this reduction to be on the order of 34 mg/l; the Salinity Forum considered the reduction to be 27 mg/l. When formulating programs designed to meet water quantity and quality committments to Mexico, these effects must be considered. (Spiegel-Florida)

WHERE DO ENVIRONMENTAL LAWS AND REGULATIONS STAND TODAY.,
Environment Information Center, Inc., New York.
L. A. Rich.
Chemical Engineering, Vol. 83, No. 22, p 9, 11, 13, 15, 17, October 18, 1976.

Descriptors: *Legislation, *Federal water pollution control act, *Chemical industry, Water pollution control, Standards, Clean air act, Effluents, Toxins, Environmental effects, Solid wastes, Industrial wastes, Regulation.

The chemical process industry's activities and wastes are claimed to have a great effect on the environment. Accordingly, controlling state and federal agencies are expected to strictly police the industry. The author of this article strongly recommends that each chemical process industry familiarize itself with environmental laws and regulations, both on the state and federal level. In order to aid this process, an overviw of federal legislative developments is presented. The 1972 Federal Water Pollution Control Act (FWPCA) has experienced mole legislative change in 1976 than any other major environmental law. The basic goals of the FWPCA are: (1) drastic reduction of discharged pollutants; (2) achievement of high water quality; and (3) elimination of toxic-pollutants discharge. Pursuant to the FWPCA, six major sets of regulations have been promulgated. These are: (1) National Pollutant Discharge Elimination System; (2) Effluent Guidelines and Standards; (3) Pretreatment Standards; (4) Oil and Hazardous Substances Rules; (5) Ocean-Dumping Rules; and (6) Toxic Pollutant Standards. The changes in these regulations are examined in some detail. In addition, changes in the Clean Air Act and Ambient Standards, the National Environmental Policy Act, solid-waste laws, noise regulations and the Toxic Substances Control Act are discussed. FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1977 (PART 2, DULUTH AND ALEXANDRIA, MINN.).
Hearings, Sucomm. on Environmental Pollution, Comm. on Environment and Public Works, U.S. Senate, June 2, 3, 1977, Serial No. 95-H25, 789 p.

Descriptors: *Federal water pollution control act, *Minnesota, *Water treatment, *Water pollution control, Effluents, Toxins, Federal government, Water pollution, Industries, Technology, Municipal water, Industrial water.

This second in a series of hearings by the Subcommittee on Environmetal Pollution of the Senate Committee on Environmental Pollution ofthe Senate Committee on Environmnent and Public Works involves a comprehensive review of the Federal Water Pollution Control Act. The purpose of the hearings isto determine what, if any, amendments to the Act are necessary. The instant hearing consists of a general review o the issues involved in the Minnesota water pollution program, while focusing specifically on the issues of best available technology for industries, and management of treatment facilities in municipalites. The 1972 law required two phases of pollution control for industrial sources. First phase goals have been almost completely realized. The second phase, based on the best technology achieveable by 1983, is the subject of these hearings. The projected economic and environmental implications are discussed by witnesses representing various perspectives within Minnesota. The second panel of the hearing explores the series of requirements for municipal facilities established by the 1972 Act, and their present application in Minnesota. Specifically, the panel seeks to know whether the requirement of proportionate user charges is necessary to assure protection of the Federal investment. (Quarles-Florida)

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1977 (PART 5, LEMARS, IOWA).
Hearing, Subcomm. on Environmental Pollution, Comm. on Environment and Public Works, U.S. Senate, June 24, 1977, Serial No. 95-H25, 164 p.

Descriptors: *Federal water pollution control act, *United States, *Legislation, *Federal government, Regulation, Water pollution, Pollution abatement, Water quality, Public utilities, Environment, Water policy.

In June, 1977, the United States Senate's Subcommittee on Environmetal Pollution met in LeMars, Iowa, to discuss implementation of the 1972 Federal Water Pollution Conltrol Act (FWPCA) Amendments. This subcommittee, chaired by Senator Edmund Muskie, derives its power from the Senate Committee on Environmental and Public Works. The opening statement was made by Senator John Culver, from Iowa. Senator Culver thought it fitting that the hearing be held in Iowa because of the state's long history of improvement and preservation of water quality. He cited several examples, including the fact that the first succesful wastewater treatment plant west of the Allenghenies was built in Iowa. The Senator discussed cost-sharing programs, soil erosion problems, agricultural productivity, and other topics. In conclusion, he emphasized his desire that the hearing facilitate better understanding of water quality programs in Iowa. After the opening statement, witnesses in many fields, including the dairy and cattle industries, the league of Women Voters, and many others, were given an opportunity to make presentations. Testimony given by these witnesses was entered into the record, along with many graphs and charts pertinent to the discussion. All are included in this document. (Spiegel-Florida)
W79-00618

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1977 (PART 8, WASHINGTON, D.C.).
Hearings Subcomm. on Environmental Pollution, Comm. on Environment and Public Works, U.S. Senate, June 21, 22, 23, 1977, Serial No. 95-H25, 619 p.

Descriptors: *Federal government, *Federal water pollution control act, *Water quality standards, *Evaluation, Legislation, Administrative agencies, Project planning, Cost sharing, Federal project policy, Environment, Public utilities.

In June, 1977, hearings were held before the Subcommittee on Environmental Pollution, a subgroup of the U.S. Senate's Committee on Environmental and Public Works. Chairperson of the Subcommittee was Senator Edmund Muskie. In the senator's opening statement he discussed issues and questions dealing with the Clean Water Act, including recommendations made by the National Commission on Water Quality. He reminded his fellow senators that their task was to focus on 'what may be' the most significant need of the water pollution program--a major revision of the construction grant program. He urged those interested in the program to discuss with the subcommittee the feasibility of a reduced Federal share of projects costs and the validity of reduction of eligible categories for construction grants. William Reilly, former federal Environmental Protection Agency Administrator, considered it now appropo to undertake a mid-term review of the Federal Water Pollution Control Act, a topic of major significance at the hearing. He also encouraged adoption of a system of charges for delayed compliance with the Act. Numerous witnesses were called to discuss these pertinent topics. All testimony is included. (Spiegel-Florida)

IOWA WATER QUALITY MANAGEMENT PLAN: DES MOINES RIVER BASIN,
Iowa Dept. of Environmental Quality, Des Moines. Water Quality Management Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 679, Price codes: A18 in paper copy, A01 in microfiche. July 1976, Glossary, 51 tab, 79 fig. See also Supporting Document and other individual Basin reports.

Descriptors: *Planning, *River basins, *Iowa, *Water resources development, *Waste water (pollution), *Waste water treatment, *Water quality management(applied), Agricultural runoff, Urban runoff, Standards, Land use, Zoning, Population, Municipal wastes, Municipal water, Lagoons, Sediment control, Economics, Low flow, Sludge digestion, Sludge disposal, Monitoring, Administration, Recycling, *Des Moines River Basin(IA), River basin planning, Areawide planning, Facilities planning, *Nonpoint pollution sources, Federal water pollution control Act, Sections 303(e), 208 and 201, Point sources, Structural alternatives, Nonstructural alternatives, Waste load allocations, Waste water collection, Secondary treatment, Primary treatment, Advanced waste treatment, Tillage practices, Woodland management.

This basin plan for the Des Moines River Basin, one of six major basins partially located in Iowa, was prepared in fulfillment of Phase I requirements of Section 303 (e) of PL 92-500. This plan includes a determination of existing water quality, inventories of development patterns and basin characteristics, applicable standards, significant point and nonpoint sources of pollution and waste load allocations in the Des Moines River Basin. Findings show that municipal population will increase by 8% to 790,000 by 1990. Only 136 of the 217 incorporated municipalities currently have collection and treatment facilities. Many facilities have no secondary treatment; waste stabilization lagoons serve nearly 50% of the municipalities and a large number of industries. Water quality violations due to point source discharges have been documented at flows well above the 7-Q-10 low flow. Violations at higher stream flows are probably attributable to rural and urban runoff and all lakes and reservoirs in the basin are subject to potential eutrophication from this runoff. Land disposal of municipal sewage sludge is the most economical ultimate disposal method currently being used in the planning area. Waste load allocations show that a significant number of dischargers will be required to provide advanced waste treatment to meet 7-Q-10 low flow standards, especially in the Upper Des Moines and Racoon River sub-basins. It is recommended that the State Water Plan give high priority to water quality. Nonstructural management measures should be considered to enhance and protect water quality. Land disposal of wastewater and municipal sludge should be further studied. Regionalization of facilities should be considered; 201 facilities planning is recommended for 9 specific areas. Structural measures to protect water quality are outlined.
W79-00645

IOWA WATER QUALITY MANAGEMENT PLAN: SUPPORTING DOCUMENT,
Iowa Dept. of Environmental Quality, Des Moines. Water Quality Management Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 680, Price codes: A10 in paper copy, A01 in microfiche. July 1976, 167 p, 9 tab, 37 fig, Glossary.

Descriptors: *Planning, *River basins, *Iowa, *Water quality, *Water quality managemet(Applied), *Water quality standards, Agricultural runoff, Urban runoff, Standards, Waste water(Pollution), Municipal wastes, Low flow, Modeling, Solid wastes, River basin planning, Facilities planning, *Nonpoint pollution sources, Waste load allocation, Primary treatment, Secondary treatment, Advanced waste treatment. *Federal water pollution control act, Sections 303(e) and 201, Northeast Iowa River Basin, Cedar-skunk-Des Moines-Southern Iowa and Western Iowa River Basins.

)This volume is a supporting document for river basin plans for six major basins partially located in Iowa--Northeast Iowa, Cedar, Skunk, Des Moines, Southern Iowa, and Western Iowa Basins. Prepared under Section 303(e) of PL 92-500, the plans include a determination of existing water quality, applicable standards and significant point and nonpoint sources of pollution. The plans identify and set forth to correct the water quality problems of each basin. This docment contains general information applicable to the six basins. The information is essentially of a supporting or background nature and was not considered to warrant duplication in each plan. The document covers five general topics: general characteristics, water quality, nonpoint pollution sources, segment analysis methodology and waste load allocation, and treatment alternatives. Included in a discussion of Iowa's general characteristics is a description of climatology, hydrogeology and ground water quality. Under water quality, Iowa's Standards and Stream Classifications are delineated. Available water quality data were gathered and evaluated to present the best available picture of recent Iowa water quality. Existing water quality is described and compared to standards. The problems of nonpoint pollution are addressed, including both characterizations of combined sewer overflows and urban and rural runoffs and the potential pollution from typical sources. The water quality modeling techniques and assumptions used to evaluate the impact of wastewater discharges upon stream quality under low flow conditios are presented in the discussion of segment analysis and waste load allocation methodologies. Finally, alternative treatment processes are described, followed by a general discussion of arrangements for upgrading of existing facilities.
W79-00646

IOWA WATER QUALITY MANAGEMENT PLAN: NORTHEASTERN IOWA BASIN.
Iowa Dept. of Environmental Quality, Des Moines. Water Quality Management Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 681, Price codes: A18 in paper copy, A01 in microfiche. July 1976, 45 tab, 56 fig, Glossary.

Descriptors: *Planning, *River basins, *Iowa, *Water resources development, *Waste water(Pollution), *Waste water treatment, *Water quality, *Water quality management(Applied), Agricultural runoff, Urban runoff, Standards, Land use, Zoning, Population, Municipal wastes, Municipal water, Lagoons, Economics, Sediment control, Low flow, Sludge digestion, Sludge disposal, Monitoring, Administration, Recycling, *Northeastern Iowa Basin(IA), River basin planning, Areawide planning, *Nonpoint sources, Federal Water Pollution Control Act, Sections 303(e) and 208, Point sources, Structural alternatives, Non-structural alternatives, Waste load allocations, Waste water collection, Secondary treatment, Primary treatment, Advanced waste treatment, Tillage practices, Woodland management.

This basin plan for the Northeastern Iowa River Basin, one of 6 major basins partially located in Iowa, was prepared in fulfillment of requirements of Section 303(e) of PL 92-500. The plan includes a determination of existing water quality, inventories of development patterns and basin charac-

teristics, applicable standards, significant point and nonpoint sources of pollution and waste load allocations in the Northeastern Iowa Basin. Findings show that the municipal population will increase by 25% to nearly 475,000 by 1990. Only 129 of the 164 incorporated municipalities currently have collection and treatment facilities. Many facilities have no secondary treatment. Waste load allocations indicate that a significant number of dischargers will be required to provide advanced waste treatment to meet 7-Q-10 low flow water quality standards. Land disposal of digested municipal sludge currently is the most economical ultimate disposal method. There are several planning areas in the basin where currently available data are inadequate, including information on combined sewers, infiltration, and BODs and nutrient loadings and assimilative capacities. It is recommended that the State Water Plan give high priority to water quality. Additional qualitative stream monitoring during low flow conditions is suggested, and additional studies of waste load allocations should be made at times other than low flow conditions. More data concerning physical stream characteristics are needed. Complete retention lagoons should be considered where applicable. Consideration should be given to designating the Davenport area as a 208 planning area. The report also recommends that Iowa and Minnesota agree on stream classifications and effluent standards for interstate waterways. Non-structural management measures should be considered. Structural measures to protect water quality are outlined. (Zayac-NC)
W79-00647

IOWA WATER QUALITY MANAGEMENT PLAN: WESTERN IOWA BASIN.
Iowa Dept. of Environmental Quality, Des Moines. Water Quality Management Div.
Available from the National Technical Information Service, Springfield VA 22161 as PB-264 682, Price codes: A17 in paper copy, A01 in microfiche. July 1976, Glossary, 47 tab, 49 fig.

Descriptors: *Planning, *River basins, *Iowa, *Water resources development, *Waste water(Pollution), *Waste water treatment, *Water quality, *Water quality management(Applied), Agricultural runoff, Urban runoff, Standards, Land use, Zoning, Population, Municipal wastes, Municipal water, Lagoons, Sediment control, Economics, Low flow, Sludge digestion, Sludge disposal, Monitoring, Administration, Recycling, *Western Iowa River Basin(IA), River basin planning, Areawide planning, Facilities planning, *Nonpoint pollution sources, Federal water pollution control act, Sections 303(e), 208 and 201, Point sources, Structural alternatives, Nonstructural alternatives, Waste load allocations, Waste water collection, Secondary treatment, Primary treatment, Advanced waste treatment, Tillage practices.

This basin plan for the Skunk River Basin, on of six major basins partially located in Iowa, has been prepared in fulfillment of Phase I requirements of Sect. 303(e) of PL 92-500. The plan includes a determination of existing water quality, inventories of development patterns and basin characteristics, applicable, standards, significant point and nonpoint sources of pollution and waste load allocations. Findings show that municipal population will increase by 23% to about 360,000 by 1990. 131 of the 148 incorporated municipalities have collections and treatment facilities. Many facilities have no secondary treatment; waste stabilization lagoons serve 47% of the municipalities and a large number of the industries. Water quality violations have been documented at flows higher than the 7-Q-10 low flow. Lakes ad impoundments are subject to potential eutrophication from urban and rural runoff. Land disposal of digested municipal sludge is the most economical method of ultimate disposal. It is recommended that the State Water Plan give high priority to water quality. Additional qualitative stream monitoring during low flow conditins is suggested; additional studies of waste load allocations should be made at times other than low flow conditions to determine nonpoint contributions. More data concerning physical stream characteristics are needed. Complete retention lagoons rather than small mechanized treatment plats should be considered. Two possible new 208 regions should be considered, along with formation of an intergovernmental water quality managemet agency for the Iowa Great lakes region. Regionalization of facilities should be considered; 201 facilities planning is recommended for the Dension area. Nonstructural management measures should be considered. Structural measures are outlined.
W79-00648

IOWA WATER QUALITY MANAGEMENT PLAN: SKUNK RIVER BASIN.
Iowa Dept. of Environmental Quality, Des Moines. Water Quality Management Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 683, Price codes: A06 in paper copy, A01 in microfiche. July 1976, Glossary, 39 tab, 22 fig.

Descriptors: *Planning, *River basins, *Iowa, *Water resources development, *Waste water(Pollution), *Waste water treatment, *Water quality, *Water quality management(Applied), Agricultural runoff, Urban runoff, Standards, Land use, Zoning, Population, Municipal wastes, Municipal water, Lagoons, Sediment control, Economics, Low flow, Sludge digestion, Sludge disposal, Monitoring, Administration, Recycling, *Skunk River Basin(IA), River basin planning, Areawide planning, Facilities planning, Federal Water Pollution Control Act, Sections 303(e), 208 and 201, Nonpoint sources, Structural alternatives, Nonstructural alternatives, Waste load allocations, Development, Waste water collection, Secondary treatment, Primary treatment, Advanced waste treatment, Tillage practices, Woodland management.

This basin plan for the Skunk River Basin, one of six major basins partially located in Iowa, has been prepared in fulfillment of Phase I requirements of Section 303 (e) of PL 92-500. The plan includes a determination of existing water quality, inventories of development patterns and basin characteristics, applicable standards, significant point and nonpoint sources of pollution and waste load allocations in the Skunk River Basin. Findings show that municipal population will increase by 39% to nearly 250,000 by 1990. Of 87 incorporated municipalities, only 53 have collection and treatment facilities. Many facilities have no secondary treatment; waste stabilization lagoons serve nearly 50% of the municipalities and a large number of industries. Water quality violations have been documented at flows higher than the 7-Q-10 low flow; all lakes and impoundments in the basin are subject to potential eutrophication from urban and agricultural runoff. Land disposal of digested municipal sludge is currently the most economical means of ultimate disposal. A significant number of dischargers will be required to provide advanced waste treatment to meet 7-Q-10 low flow water quality standards. Except for the Mississippi River, the Skunk River Basin is water quality limited. It is recommended that the State Water Plan give high priority to water quality. Nonstructural management measures should be considered to enhance and protect water quality. Land disposal of wastewater and municipal sludge should be further studied. Regionalization of facilities should be considered where wasteload allocations have indicated; 201 facilities planning is recommended for 5 areas. Structural measures to enhance and protect water quality are outlined.
W79-00649

IOWA WATER QUALITY MANAGEMENT PLAN: SOUTHERN IOWA BASIN.
Iowa Dept. of Environmental Quality, Des Moines. Water Quality Management Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 684, Price codes: A14 in paper copy, A01 in microfiche. July 1976, 37 tab, 36 fig, Glossary.

Descriptors: *Planning, *River basins, *Iowa, *Water resources development, *Waste water(Pollution), *Waste water treatment, *Water quality, *Water quality management(Applied), Agricultural runoff, Urban runoff, Standards, Land use, Zoning, Population, Municipal waste, Municipal water, Lagoons, Sediment control, Economics, Low flow, Sludge digestion, Sludge disposal, Monitoring, Administration, Recycling, *Southern Iowa River Basin(IA), River basin planning, Areawide planning, Facilities planning, Federal Water Pollution Control Act, Sections 303(e), 208 and 201, Point sources, Structural alternatives, Nonsturctural alternatives, Waste load allocations, Secondary treatment, Waste water collection, Primary treatment, Advanced waste treatment, Tillage practices, Woodland management.

This basin plan for the Southern Iowa, has been prepared in fulfillment of Phase I requirements of Section 303(e) of PL 92-500. The plan incudes a determination of existing water quality, inventories of development patterns and basin characteristics, applicable standards, significant point and nonpoint sources of pollution and waste load allocations in the Southern Iowa Basin. Findings show that municipal population will increase by 25% to nearly 145,000 by 1990. Only 62 of 132 incorporated municipalities have collection and treatment facilities; many facilities have no secondary treatment. Waste stabilization lagoons serve nearly 51% of the municipalities and a large number of industries. Water quality violations have been documented at flows higher than 7-Q-10 low flows; all lakes and reservoirs in the basin are subject to potential eutrophication from urban and agricultural runoff. Land disposal of digested municipal sludge is the most economical means of ultimate disposal. A significant number of dischargers will be required to provide advanced waste treatment to meet 7-Q-10 low flow water quality standards. It is recommended that the State Water Plan give high priority to water quality. Nonstructural management measures should be considered to enhance and protect water quality. Land disposal of wastewater and municipal sludge should be further studied. Regionalization of facilities should be considered where wasteload allocations have indicated; 201 facilities planning is recommended for 7 areas. There is already a 4-county 208 planning area surrounding Rathburn Lake; no more are recommended. Structural measures to enhance and protect water quality are outlined. (Zayac-NC)
W79-00650

IOWA WATER QUALITY MANAGEMENT PLAN: IOWA-CEDAR RIVER BASIN.
Iowa Dept. of Environmental Quality, Des Moines. Water Quality Management Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 685, Price codes: A18 in paper copy, A01 in microfiche. July 1976, 40 tab, 53 fig, Glossary.

Descriptors: *Planning, *River basins, *Iowa, *Water resources development, *Waste water(Pollution), *Waste water treatment, *Water quality management(Applied), Agricultural runoff, Urban runoff, Standards, Land use, Zoning, Population, Municipal wastes, Municipal water, Lagoons, Sediment control, Economics, Low flow, Sludge digestion, Sludge disposal, Monitoring, Administration, Recycling, *Iowa-Cedar River Basin(IA), River basin planing, Areawide planning, Facilities planning, Federal Water Pollution Control Act, Sections 303(e), 208 and 201, Structural alternatives, Nonstructural alternatives, Waste load allocations, Waste water collection, Secondary treatment, Primary treatment, Advanced waste treatment, Tillage practices, Woodland management.

This basin plan for the Iowa-Cedar River Basin, one of six major basins partially located in Iowa, has been prepared in fulfillment of Phase I requirements of Section(e) of PL 92-500. The plan includes a determination of existing water quality, inventories of development patterns and basin characteristics, applicable standards, significant point and nonpoint sources of pollution and waste load allocations in the Iowa-Cedar River Basin. Findings show that municipal population will increase by 19% to about 690,000 by 1990. Of 207 incorporated municipalities, only 133 have collection and treatment facilities. Many facilities have no secondary treatment. Waste stabilization lagoons serve 45% of the basin's municipalities and a large number of industries. Water quality violations have been documented at flows well above the 7-Q-10 low flow, mostly attributable to point source discharges. Violations at high stream flows have also been documented; all lakes and impoundments in the basin are subject to potential eutrophication from rural and urban runoff. Land disposal of digested municipal sludge is the most economical ultimate disposal method in the planning area. A significant number of dischargers will be required to provide advanced waste treatment to meet 7-Q-10 low flow water quality standards. It is recommended that the State Water Plan give high priority to water quality. Non-structural management measures should be considered to enhance and protect water quality. Land disposal of wastewater and municipal sludge should be considered where wasteload allocations have indicated; 201 facilities planning is recommended for 13 areas. Structural measures to protect water quality are outlined. (Zayac-NC)

SEVERAL PROBLEMS OF THE RATIONAL CONSTRUCTION AND EXPLOITATION OF RESERVOIRS AND CANALS AS EXAMPLIFIED BY THE UCHINSKOYE RESERVOIR AND THE MOSCOW CANAL, (IN RUSSIAN),
All-Union Hydrobiological Society, Moscow (USSR).
A. V. Frantsev.
Gidrobiol Zh 12(5), p 13-19, 1976.

Descriptors: Bank, *Canals, Epiboly, Erosion, Exploitation, Fishes, Fodder, Grass, Livestock, Moscow, Plants, Recreation, Reservoir operation, *Reservoirs, Seeding, Trees, Uchinskoye, USSR, *Water pollution.

Examples and methods for biolgical improvement of water quality in supply reservoirs and canals are discussed, including strengthening of banks, tree planting, the seeding of water plants, use of oblique booms, aeration, collection of swimming pollutants, construction of settling tanks in canals, control of epibolies and sowing of fodder grass. The effect of the growth of water plants in shallow waters on the fish population is discussed. Experience in biological amelioration of the Moscow canal and Uchinskoye reservoir (Russian SFSR, USSR) indicate that simple and inexpensive measures can simultaneously halt erosion of banks, improve recreational conditions, provide supplemental feed for livestock and increase the fish productivity of water bodies--Copyright Biological Abstracts, Inc.

INTERIM PLAN FOR WATER QUALITY MANAGEMENT IN THE DENVER METROPOLITAN AREA.
Denver Regional Council of Governments, CO.
Addendum No. 1, July 1971, 22 p, 7 tab, Exhibit.

Descriptors: *Water quality, *Waste water treatment, *Water quality management(Applied), Biochemical oxygen demand, Sludge, Waste, Government, Sewage disposal, Costs, *Denver(CO), *Water quality management, Environmental improvements, Environmental assessment.

This Addendum was prepared at the request of EPA for supplemental information to the original Interim Plan. Five points were raised by EPA and responded to by the Denver Regional Council of Governments (DRCOG). (1) Individual governmental and organizational units and their relationships with the DRCOG should be further defined. Advisory committees have been established under and by DRCOG; the report sets out how these agencies interrelate. (2) A schedule of priorities and costs should be developed for designated improvements in water quality management. DRCOG presents estimated project costs for each improvement area. (3) The original plan should discuss further the impact of the proposed improvements upon existing water quality and water quality standards. Actions taken to gather the necessary data for determining water quality impacts are listed, as well as the proposed improvements by area; the purpose and benefits of each improvement are discussed. (4) Alternative regional treatment plans should be proposed. Reference is made to a previous report in which this issue is examined and data provided. (5) A revised Environmental Statement should be submitted in accordance with 6 specific requirements. DRCOG discusses 6 points presented in its Environmental Assesssment--probable impact, probable unavoidable adverse impacts, alternatives considered, relationship between short-term uses of the environment and enhancement of long-term productivity, irreversible commitment of resources, and public objections based on environmental issues. Additional needed improvements in sewerage systems are presented, by basin area, with estimated costs given for these improvements.

UTAH LAKE-JORDAN RIVER HYDROLOGIC BASINS WATER QUALITY MANAGEMENT STUDY. VOLUME I.
Templeton, Linke and Alsup, Salt Lake City, UT.; and Engineering Science, Inc., Berkeley, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 574, Price codes: A19 in paper copy, A01 in microfiche.
Prepared for Utah State Department of Social Services, Bureau of Water Quality, June 1975, 84 fig, 86 tab. Sea also Volume II.

Descriptors: *Planning, *Water quality, *Water management(Applied), *Water use, *Water resources development, Management, Population, Land use, Economics, Economic evaluation, Pollutants, Inflow, Infiltration, Waste water treatment, Waste water disposal, Cities, Irrigation, Agricultural runoff, Urban runoff, Surface waters, Utah, Environmental effects, *Utah Lake(UT), *Jordan River(UT), Natural environment, Point sources, Nonpoint sources, Federal Water Pollution Control Act-Section 303(e), Public participation.

This report was prepared in compliance with federal regulations for river basin plans as defined in Section 303(e) of the Federal Water Pollution Control Act Amendments of 1972. The basic purpose of the study was to develop a comprehensive plant that would serve as a framework for future water quality planning and control activities within the Utah Lake-Jordan River hydrologic basins. Information necessary to develop a detailed picture of the study area--including a discussion of the natural environment and a population, land use and economic inventory--is presented first. Present water quality in the rivers and streams is then discussed and sources of pollution-causing wastes are identified. Present and future waste load allocations are estimated and treatment needs determined; alternative ways of handling municipal wastewaters were synthesized and evaluated with regard to cost, environmental factors, feasibility and overall effectiveness. Results of the public participation program are included in the report. The recommended plan first calls for the maintenance of sufficient flow rate levels to maintain a balance of flora and fauna. Point source pollution abatement is given first priority because of its immediate significance. Infiltration and inflow are addressed because of their excessive nature in many collection systems. Recommended plans for municipal wastewater management in 1980 are diagrammed; possible developments of the plans after 1980 are then presented. Some institutional possibilities for administration are discussed. Finally, measures for reducing urban runoff, mitigating the deleterious effects of nonpoint agricultural runoff and minimizing surface water pollution due to irrigation return flow are outlined. ASSESSING THE SOCIAL IMPACTS OF OIL SPILLS. PROCEEDINGS OF AN INVITATIONAL SYMPOSIUM.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 726, Price codes: A06 in paper copy, A01 in microfiche.
Proceedings of an invitational symposium cosponsored by the Institute on Man and Science and the U.S. Environmental Protection Agency held at Rensellaerville, New York on September 25-28, 1973, 129 p.

Descriptors: *Oil spills, *Water pollution, *Oil industry, *Economics, *Legislation, *Environmental effects, *Oil pollution, Compensation, Legal aspects, Recreation, Coasts, *Government policies, *Corporations, *Environmental impacts, Social impacts, Political science, Damage.

This report presents the results of an invitational symposium held to encourage the development of techniques and methodologies in the assessment of the social impact of oil spills. It is divided into topic areas which correspond to the individual session themes. These topics include general perspectives on oil spills, EPA's response to oil spills, legal and corporate response to oil spills, public interest groups' attitudes on oil spills and economic and political approaches to the problems caused by oil spills. The participants are from universities, government agencies, international conservation groups, corporations, and research laboratories both here and abroad. A brief narrative account of each session introduces the faculty presentations. These accounts describe the kinds of questions raised by the participants, delineate the major points of debate and discussion, and summarize the group response to the two learning exercises, posed as task team assignments, that were incorporated within the program's format. Two appendices are provided which include articles by environmental specialists not included in the formal program sessions. These articles are on the properties and environmental effects of oil, compensation for oil pollution damages, international activi-

ty responding to oil pollution damage from vessels at sea, and oil and the energy crisis. (Coan-NC)

THE NATIONAL ENVIRONMENTAL POLICY ACT AND FEDERAL WATER RESOURCES PLANNING: EFFECTS AND EFFECTIVENESS IN THE CORPS AND SCS,
Stanford Univ., CA. Dept. of Civil Engineering.
W. W. Hill.
December 1977, 257 p, Report No. IPM-4.

Descriptors: *Decision making, *Planning, *Evaluation, *Water resource planning, Alternative planning, Surveys, Formulation, *National Environmental Policy Act, *Army Corps of Engineers, *Soil Conservation Service, Implementation, Environmental planning.

The study's research objective is to measure changes in water resources planning and decision-making processes induced by the National Environmental Policy Act (NEPA). The water resources agencies examined are the field level offices of the Army Corps of Engineers--preauthorization planning (survey investigations) and the Soil Conservation Service (SCS)--small watershed planning. The research first examines factors which are necessary, but not sufficient, conditions for the achievement of NEPA's objectives. These conditions involve policy level responses and resource commitments which an agency must make if more substantive changes in planning and decision-making are to occur. Following this assessment, the analysis focuses more directly on changes in planning and decision-making. The evaluation focuses on: the perceptions of Corps and SCS field level personnel regarding NEPA's effects and effectiveness; the degree to which the agencies utilize a systematic interdisciplinary approach which will insure the integrated use of the natural and social sciences and the environmental design arts in planning and decision-making; the degree to which NEPA influences both the selection of alternatives considered (formulation) and the selection of a recommended alternative (evaluation); and increased access to and influence on agencies planning and decision-making processes. It is found that NEPA has had an effect on water resources planning and decision-making in the Corps and SCS. (Nessa-NC)

CAPE COD WATER QUALITY MANAGEMENT PLAN.
Massachusetts Water Resources Commission, Westborough. Water Quality Section.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 789, Price codes: A05 in paper copy, A01 in microfiche.
January 1976, 61 p, 11 tab, 5 fig, 4 append.

Descriptors: *Water quality, *Water quality control, *Water quality standards, *Planning, *Water pollution, *Water management(Applied), *Water pollution control, *Coastal areas, Regulation, Water resources, Land use, Shellfish, Storm runoff, Groundwater, Abatement, Massachusetts, *Cape Cod(MA), *Non-point pollution sources, River basin planning, 208 planning, Marine water resources, Coastal management.

This report describes the status of water quality on Cape Cod, MA. It also presents an inventory of past planning efforts and can be used as a guide for the 208 study authorized in 1976. Cape Cod, an area of 410 sq. miles, has 15 towns with a permanent population of 97,000. Although there are only a few small freshwater streams, ponds and lakes are abundant. Water quality problems exist on Cape Cod but the vast majority of the coastal waters are clean. Of the approximately 12,600 acres of productive shellfish, 350 acres, or 3%, are closed to fishing and swimming for not meeting the assigned classification standards. Some saltwater intrusion of groundwater has occurred in the north Truro-Provincetown area and some areas have high concentrations of iron and manganese in the groundwater. Non-point pollution is the main source of water pollution on Cape Cod. These sources are boating, sanitary wastes from watercraft, oil spillage, drainage from landfill areas and septic tanks, and stormwater. The report briefly describes their impacts. Past efforts at planning for water quality management are recognized and both public and private actions in the conservation of water and land resources are identified. These actions include local enforcement of subsurface disposal regulations; establishment of local regulations to inhibit pond eutrophication; construction or expansion of small collection systems and possible intertown sewer service areas; and construction of pump-out facilities at marinas. The report concludes with a glossary of technical terms and a discussion of the rules and regulations for the establishment of minimum water quality standards and for the protection of the quality and value of water resources. EVALUATION OF RECIRCULATING SYSTEMS FOR THE CULTURE OF CHANNEL CATFISH,
Memphis State Univ., TN. Dept. of Biology.
N. C. Parker, and B. A. Simco.
In: Proceedings of the 27th Annual Conference, Southeastern Association of Game and Fish Commissioners. p 474-487, 1973. 5 fig, 1 tab, 19 ref. OWRT B-028-TENN(2).

Descriptors: *Fish reproduction, *Recirculating systems, Evaluation, Water reuse, Recycling, Water quality, Water pollution control, Filters, *Channel catfish.

The development of nutritionally complete feeds has permitted the culture of channel catfish under increasingly intensive conditions. Recirculating raceways and tank culture systems have been the subject of several recent investigations. Ten recirculating systems were built at Memphis State University to evaluate their feasibility for the culture of channel catfish. It was concluded that: (1) Self-cleaning settling chambers and final clarifiers remove particulate matter and extend the life of biofilters. Biofilters will quickly detoxify ammonia to less innocuous nitrates. (2) Water quality is limited by system design; the design determines the maximum water quality obtainable when proper management practices are followed. Water quality in a flow-through system is controlled primarily by the rate of inflow. In a recirculating system, water quality is controlled by the fresh water inflow or exchange rate, the flow rate per tank, and the filter size. An increase in any of these variables will result in an increase in water quality. A formula relating water quality with design variables has been prepared. The recirculating systems, designed for this study, have produced in excess of 7 lbs/ft3 per tank and over 5 lbs/ft3 for the entire system. (Larson-Tenn)

CULTURE OF CHANNEL CATFISH IN A HIGH FLOW RECIRCULATING SYSTEM,
Memphis State Univ., TN. Dept. of Biology.
M. C. Broussard, Jr., N. C. Parker, and B. A. Simco.
In: Proceedings of the 27th Annual Conference, Southeastern Association of Game and Fish Commissioners. p 745-750, 1973. 2 fig, 1 tab, 10 ref. OWRT B-028-TENN(3).

Descriptors: *Fish reproduction, High flow, Water reuse, Recycling, *Recirculating systems, Dissolved oxygen, Temperature, Fish diseases, Water quality, *Channel catfish.

Fish production is limited by several factors, such as dissolved oxygen, temperature, disease and the build up of waste products. Although ponds normally support up to 2,000 lb/acre, Greene (1971) increased this carrying capacity to over 20,000 lb/acre by biofiltration and recirculation of the water. This study concluded that greater carrying capacities for the culture of channel catfish in closed recirculating systems can be obtained with high flow rates and filter to tank ratios. A density of 7.2 lb/ft3 was obtained in a 142 day growing period. Both updraft and trickling filters were effective in reducing ammonia levels without the removal of any significant amount of solid materials from the system. Solid wastes quickly clogged filters containing coal slag, but plastic scraps, oyster shells, teflon rings and styrofoam packing material served effectively as filter media. (Larson-Tenn)

MECHANICAL DISPERSAL OF OIL STRANDED IN THE LITTORAL ZONE,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
E. H. Owens.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 563-572, May 1978. 12 fig, 2 tab, 19 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Weathering, *Dispersion, *Oil pollution, Water pollution effects, Environmental effects, Littoral, *Outer Continental Shelf, Canada, Coastal processes.

The natural weathering and dispersion of oil stranded in the littoral zone depend on the type and volume of the oil and on the amount of available energy. Energy inputs can be biological, chemical, mechanical, or thermal; however, the single most important input appears to be from mechanical energy (winds, waves, tides, water levels, and ice). The residence time or persistance of stranded oils increase as mechanical energy

levels at the shoreline decrease. The primary inputs of mechanical energy at the shoreline are due to wave action, and energy levels vary depending on the wind regime, fetch areas, and local exposure of a section of coast. In cold or polar climates, energy levels at the shoreline are reduced by the presence of ice on the sea or an ice foot on the beach. This review of the concepts associated with littoral processes, in terms of the mechanical dispersal of stranded oil, provides the basis for estimation of the persistence of oil on shorelines. MEASURES AGAINST STORM WATER POLLUTION, (IN SWEDISH),
Chalmers Univ. of Technology, Goteborg (Sweden). Vatten Inst. Tek.
P. A. Malmquist, and G. Svensson.
Vatten 33(2), p 153-166, 1977.

Descriptors: *Storm water, *Water pollution control, Waste assimilative capacity, Path of pollutants, Mathematical models, Soils, Sweden, Vegetation.

Urban storm water causes by its large volume, its high water flow and its pollutant content considerable costs and damage of different kinds. The storm water pollutants may seriously affect the surface waters, the ground water, the soils and the vegetation and, in the combined system, the sewage treatment plants. The storm water pollutant loads must be decreased if the effects mentioned are to be avoided. This can be done in 2 complementary ways: by reducing the storm water pollutant sources and by decreasing the storm water flows. In a series of research projects at Chalmers University of Technology (Sweden) different methods of decreasing the pollutant loads were investigated. The choice between combined and separated sewage systems is important when the total pollutant load from a city is considered. For an investigation area, the combined system causes higher BOD (biochemical O2 demand) and nutrient loads, but lower suspended solids and heavy metal loads than does the separate system. If the storm water volumes are decreased by local infiltration and percolation, and if retention basins are used, the total pollutant loads can be considerably decreased, especially the loads from the combined system. The storm water pollutant sources are mainly atmospheric fallout, corrosion of building materials, and traffic. The choice of measures and the consequences thereof are a complicated problem, and the use of mathematical models of the planning type facilitates the decision-making. The best effects are obtained if the urban water balance is considered during the planning processes.--Copyright 1978, Biological Abstracts, Inc.

STATE OF THE STOCK OF STURGEON ACIPENSER BAERI BRANDT IN SIBERIAN RIVERS AND MEASURES TO INCREASE THEIR REPRODUCTION, (IN RUSSIAN),
N. P. Votinov, and V. P. Kas'yanov.
Vorp Ikhtiol. 14(5), p 796-805, 1974.

Descriptors: Acipenser-baeri, Artificial breeding, Fisheries, Reproduction, Rivers, Siberian, *Sturgeon, USSR, Water pollution control.

Data are presented on the current state of the stock of sturgeon (A. baeri) in the Ob-irtysh basin and Enisei and Lena Rivers in Siberia (USSR). At present the stock is in a stressed state owing to a decline in reproduction caused by hydropower construction, progressive pollution of the spawning grounds and an irrationally organized fishery. In recent years sturgeon catches have declined 4-fold in comparison to 1960-1964. To increase the abundance of sturgeon in the Ob-Irtysh basin, artificial breeding is necessary. In the Enisei and Lena basins, the fishery must be rationally organized.--Copyright 1975, Biologica Abstracts, Inc.

OILED SEABIRD RESCUE AND CONSERVATION,
Newcastle upon Tyne Univ. (England) Dept. of Zoology.
R. B. Clark.
Journal of the Fisheries Research Board of Canada, Vol 35, No 5, p 675-678, May 1978. 18 ref. From: Proceedings of the Symposium on 'Recovery Potential of Oiled Marine Northern Environments' held at Halifax, Nova Scotia, October 10-14, 1977.

Descriptors: *Oil pollution, *Environmental effects, *Birds, *Rehabilitation, Oil spills, Water pollution effects, *Outer continental shelf, *Torrey Canyon, United Kingdom, Petroleum hydrocarbons, Marine birds, Uria aalge, Alca torda.

Attempts were made to clean and rehabilitate nearly 8000 oiled birds (maily auks) following the wreck of the Torrey Canyon. This was an almost total failure and a Research Unit on the Rehabilitation of Oiled SEabirds was established in Newcastle upon Tyne to devise effective tratment methods. This has involved a study of the mechanism of water-repellency in seabird plumage and led to the developent of cheap, effective cleaning methods and full recovery of the birds within 2-3 wk of capture. These methods have been used successfully on small numbers of birds y amateurs and also operationally on larger numbers by the Research Unit. There have been only few ringing returns but at least some of the cleaned birds became reintegrated with the breeding populations after release. Even with appropriate organization and facilities it is doubtful whether the rescue and treatment of oiled birds can make a material contribution to seabird conservation, but there is often strong public pressure for the treatment of oiled birds and the development of suitable techniques makes this possible. MACROPHYTE CONTROL BY HARVESTING AND HERBICIDES: IMPLICATIONS FOR PHOSPHORUS CYCLING IN LAKE WINGRA, WISCONSIN,
Wisconsin Univ.-Madison. Dept. of Botany.
S. R. Carpenter, and M. S. Adams.
Journal of Aquatic Plant Management, Vol. 16, p 20-23, June 1978. 4 fig, 24 ref. NSF DEB-7519777.

Descriptors: *Phosphorus, *Lake Wingra(WI), *Harvesting, *Aquatic weed control, *Eurasian water milfoil, *Eutrophication, *Herbicides, *Cycling nutrients, *Littoral, Mechanical control, Chemcontrol, Lakes, Madison(WI), Wisconsin, Macrophytes, Myriophyllum spicatum, Nutrient removal, Nutrients, Nutrient requirements, Limiting factors, Minerals, Urban runoff, Shallow water.

Harvesting Eurasian water milfoil (Myriophyllum spicatum) from shallow, eutrophic Lake Wingra, in Madison, Wisconsin, would remove an equivalent 37% annual net phosphorus load, 100% available phosphorus, and 22% total inorganic phosphorus in the upper 12 cm of littoral sediments. By contrast, herbicides would release at least 165 kg phosphorus into lake water within a few days, thereby increasing eutrophication. Such a nutrient pulse, equal to about 10% of the lake's annual net phosphorus load, would include considerable phosphate readily assimilable by algae. Lake Wingra, already eutrophic before settlement by Europeans in the area, receives a heavy nutrient loading from urban runoff, and though harvesting alone would not reverse the eutrophic process, harvesting plus reductions of point-source nutrient loads would significantly improve the lake's water quality. Annual harvesting would be necessary to deplete available phosphorus in the sediments because: (1) shoots obtain an unknown fraction of their phosphorus from the water. (2) available phosphorus in sediments is continually replenished by equilibration with insoluble forms, and (3) phosphorus is continually added to sediments by sedimentation. Harvesting would remove 15 kinds of minerals from the lake, including 10 essential plant nutrients. Maximum removal of phosphorus, the most critical process-limiting nutrient in the lake, would occur with a late August harvest. (Lynch-Wisconsin)
W79-00771

PRODUCTION AND UTILIZATION OF AQUATIC PLANT COMPOST,
Ontario Ministry of the Environment, Rexdale. Water Resources Branch.
I. Wile, J. Neil, G. Lumis, and J. Pos.
Journal of Aquatic Plant Management, Vol. 16, p 24-27, June 1978. 8 tab, 1 ref.

Descriptors: *By products, *Eurasian water milfoil, *Composts, *Aquatic plants, *Harvesting, *Fertilizers, Myriophyllum spicatum, Aquatic weed control, Mechanical control, Crop production, Flowers, Vegetable crops, Grasses, Trees, Fruit crops, Salt tolerance, Hydrogen ion concentration, Moisture content, Nutrients, Chemical analysis, Manure, Tobacco, Methodology.

Five composts utilizing harvested aquatic plants, primarily Eurasian water milfoil (Myriophyllum spicatum), were tested and found effective in

green house experiments with a variety of plants, vegetables, fruit, and turf grasses. Results demonstrated the value of composted aquatic plants as fertilizer ingredient, and indicate that with reduction of pH and salt levels, these composts would be equal or superior to existing commercial products. The composts, prepared in a high-rate aerobic composter, consisted of peanut shells to reduce moisture content and: (1) 78% air-dried aquatic plants, plus wet pondweed and poultry litter; (2) 83% unchopped aquatic plants and compost no. 1; (3) 80% chopped aquatic plants and compost no. 2; (4) 62% chopped aquatic plants, 21% tobacco paunch manure compost, and poultry litter; and (5) 68% chopped aquatic plants and 27% ground corn cobs. Chemical analyses of raw materials and composts are given in tables. Preliminary tests showed poultry litter produced extremely high salt levels (over .005 mhos). In experiments with top-watered Chrysanthemums, compost no. 4 produced plants and flowers superior to those grown in other composts or with peat moss; watering by capillary mat was unsatisfactory. Some composts stimulated growth of coleus, petunias, geraniums, creeping red fescue, marion kentucky bluegrass, perennial ryegrass, and germination of tomatoes and muskmelon, but not for white cedar due to high salt content. (Lynch-Wisconsin)

HYDRILLA SILAGE PRODUCTION, COMPOSITION AND ACCEPTABILITY,
Florida Univ., Gainesville. Inst. of Food and Agricultural Sciences.
L. O. Bagnall, K. E. Dixon, and J. F. Hentges, Jr.
Journal of Aquatic Plant Management, Vol. 16, p 27-31, June 1978. 3 fig, 6 tab, 14 ref.

Descriptors: *Silage, *Hydrilla verticillata, *Cattle, *Feeds, *Aquatic plants, *By products, Aquatic weed control, Harvesting, Mechanical control, Pastures, Florida, Orange Lake(FL), Carbohydrates, Propionic acid, Citrus fruits, Moisture content, Hay, Equipment, Spoilage, Methodology.

Pressed Hydrilla verticillata made into silage with supplementary fermentable carbohydrate (dried citrus pulp, ground shelled corn, and propionic acid), was readily accepted by cattle. Steers consumed all of the hydrilla silage and coastal Bermudagrass hay offered them, but only 67% of hydrilla hay. Hydrilla harvested from Orange Lake, south of Gainesville, Florida, contained 7.5% dry matter initially and was screw-pressed to reduce moisture content. Fifteen kg was pressed in a 10-cm press for preliminary trials, 480 kg was pressed in a 20-cm press for preliminary animal acceptability trials, and 15,700 kg was chopped by forage harvester and pressed in a 30-cm press for animal acceptability and consumption trials. Pressed hydrilla was mixed with supplementary materials, packed into closed containers, and stored in 450-ml wide-mouthed polyethylene bottles, 208-liter drums, or 1.2 x 2.4-m culvert silos. Bottle samples were stored 300 days, barrel silages 113 days, and culvert silages 133 days. In general temperature rise caused by biological activity in the silage was small and brief. All pH levels were higher than the 3.5-4.0 common for high-quality silage of common terrestrial crops, normally an indication of low silage quality. Bottled hydrilla without dried citrus pulp became putrid, spoilage in barrels was 22-100%, and spoilage in culvert silos ranged from 17-25%. Odor of usable silage was typical of good silage. CHEMICAL CONTROL OF HYDRILLA,
Corps of Engineers, Washington, DC.
E. O. Gangstad.
Journal of Aquatic Plant Management, Vol. 16, p 38-40, June 1978. 4 tab, 9 ref.

Descriptors: *Chemcontrol, *Hydrilla verticillata, *Aquatic weed control, *Herbicides, *Diquat, *Copper, *Toxicity, *Reservoirs, Water pollution effects, Copper sulfate, Cutrine, Copper sulfate pentahydrate, Pesticide residues, Alkalinity, Ammonia, Nitrates, Dissolved oxygen, Fish, Florida, Inglis Reservoir(FL).

Growth pool simulations and large-scale field tests showed good control of Hydrilla verticillata by combinations of diquat and copper, with no toxic effects on fish. Residues of diquat and copper in the water were negligible 14 days after treatment, but there was a statistically significant increase in ammonia-nitrogen and a slow decline in nitrate-nitrogen. Little effect was detected on dissolved oxygen in surface waters. In the initial simulations diquat, diquat plus copper sulfate pentahydrate (CSP), copper sulfate, and encapsulated copper sulfate were applied to hydrilla in 3.4-m diameter plastic pools, and effects were monitored for eight weeks. Pools contained bluegills, largemouth bass, and channel catfish. No fish mortality resulted. Diquat plus CSP provided greatest effectiveness against hydrilla (100% after four weeks), followed by diquat alone (80-93% after eight weeks). Field tests were performed at two sites in Inglis Reservoir, western Florida, using diquat plus Cutrine (triethanolamine copper complex) and diquat plus CSP to hydrilla beds. Plant density estimates were made before treatment and 3-128 days after treatment. Diquat plus CSP was again the most effective, achieving 93% control after 82 days, declining to 74% after 128 days. Diquat plus Cutrine was 76% effective after 82 days, decreasing to 44% after 128 days. Satisfactory control persisted with both treatments for about nine months. (Lynch-Wisconsin)

AN APPROACH TO ESTIMATING THE STANDING CROP OF WATERHYACINTH,
Commonwealth Scientific and Industrial Research Organization, Brisbane (Australia). Long Pocket Labs.
I. W. Forno, and A. S. Bourne.
Journal of Aquatic Plant Management, Vol. 16, p 50-52, June 1978. 1 fig, 1 tab, 3 ref.

Descriptors: *Water hyacinth, *Standing crops, *Estimating, *Biocontrol, *Aquatic weed control, *Methodology, Equations, Eichhornia crassipes, Aquatic plants, Drying, Lagoons, Australia, Leaves, Petioles, Queensland(Australia).

A method for estimating the standing crop of water hyacinth (Eichhornia crassipes) categorizes plants as 'peaked' and 'nonpeaked' groups according to the distribution of leaves over classes defined by petiole length. Equations are presented for each group, which provide estimates accurate to within 10% of values obtained by weighing dried samples. Plants in three lagoons in southeastern Queensland, Australia, were used in developing the method. Leaves from each plant sampled were divided into five classes according to petiole length: 0-10 cm, 10-20 cm, 20-40 cm, 40-60 cm, and 60 cm. Leaves in each class were counted, dried to constant weight at 70C, and weighed, and mean dry wt/leaf determined for each class. It was apparent that a relationship existed between mean leaf weight and petiole length, but a substantial variation in mean leaf weights of different samples required modification of the simple equation for standing crop. Data indicated proportional allocation of leaves to each class was significant; this was due to conditions of peaked growth at the end of summer, compared with nonpeaked growth early in winter then cold weather stimulates production of shorter leaves with more bulbous petioles. Separation into the two groups is accomplished by means of a ratio of actual leaf weight to estimated leaf weight. The equation for the peaked group is 0.339 C1 + 0.685 C2 + 1.002 C3 + 1.848 C4 + 3.077 C5, and for the nonpeaked group 0.218 C1 + 0.409 C2 + 0.730 C3 + 1.313 C4 + 2.485 C5, where C1, C2, C3, etc. denote number of leaves in each class. (Lynch-Wisconsin)

A REVIEW OF CURRENT INTEREST AND RESEARCH IN WATER HYACINTH-BASED WASTEWATER TREATMENT,
Battelle Columbus Lab., OH.
R. K. Markarian, J. E. Balon, and A. C. Robinson.
Available from the National Technical Information Service, Springfield, VA 22161 as N77-33683, Price codes: A04 in paper copy, A01 in microfiche. Report BCL-OA-TFR-77-1, February 1977. 53 p, 9 fig, 10 tab, 33 ref, 2 append. NASA NASW-2800, Task Number 16.

Descriptors: *Water hyacinth, *Waste water treatment, *Reviews, *Treatment facilities, *Tertiary treatment, Nutrient removal, Eichhornia crassipes, Beneficial use, Aquatic plants, Sewage treatment, Industrial wastes, Municipal wastes, Research priorities, Institutional constraints, Regulation, Water quality standards, Effluent limitations.

A survey of researchers, literature, and potential users indicates that water hyacinth (Eichhornia crassipes) for wastewater treatment can provide a lower-cost method for small cities and towns to meet increasingly stringent effluent requirements. While there have been a few demonstrations of hyacinth systems during the past two years, little design data has been made available. Several full-scale projects are planned for 1977-78. At present there is no surce from which to purchase a treatment system or design which has been approved by appropriate regulatory agencies or for which there are demonstrated performance capabilities or cost information. Such a product may be available in three or four years, however, as several suppliers of conventional systems are testing hyacinth designs. Controlled experiments under realistic nutrient loading conditions are needed to develop a satisfactory system. Required data include: (1) optimal physical design (lagoon depth, area, holding time, and harvesting methodology); (2) construction and operating costs; (3) plant-escape prevention techniques; and (4) system performance under various loading conditions and temperature cycles. The best institutional arrangement for such testing would involve a joint effort of an engineering firm, wastewater treatment authority, regulatory agencies and a funding source such as EPA. The use, if any, of harvested plants is not of general concern. (Lynch-Wisconsin)

Descriptors: *Finger Lakes(NY), *Aquatic weed control, *Distribution, *Cayuga Lake(NY), *Eutrophication, *Eurasian water milfoil, New York, Lakes, Otisco Lake(NY), Skaneateles Lake(NY), Owasco Lake(NY), Seneca Lake(NY), Keuka Lake(NY), Canadaigua Lake(NY), Conesus Lake(NY), Biocontrol, Chemcontrol, Mechanical control, Macrophytes, Species composition, Species diversity, Density, Myriophyllum spicatum, Nutrients, Sedimentation, Littoral.

Eurasian water milfoil (Myriophyllum spicatum) surveyed in Cayuga Lake in summer-fall 1974 was the worst weed problem in eight of New York State's finger lakes. Seneca Lake is not as severely infested, but has significant milfoil population at its north end. Skaneateles, Otisco, Owasco, Keuka, Canadaigua, and Conesus Lakes have small, isolated weed problems, but are generally in excellent condition. The most troublesome plants in the Finger Lakes are: Eurasian water milfoil, northern water milfoil (Myriophyllum exalbescens), coontail (Ceratophyllum demersum), water star grass (Heteranthera dubia), Vallisneria americana, and pondweed (Potamogeton spp.). The flora and effects of eutrophication are distinct for each lake, though excessive weed growth is primarily caused by a combination of nutrient availability and heavy sedimentation in shallow areas. Recommended short-term control measures include harvesting of plants in conjunction with carefully controlled herbicide applications. Harvesting also provides long-term benefits through nutrient removal, as does dredging. The most important long-term goal is control of urban sprawl through land-use restrictions. (Lynch-Wisconsin)
